There is no more pernicious delusion than that embodied in Czerny's Forty Daily Studies, where he directs you brutally to "Play this twenty times"—"Repeat thirty times"; and so on. It is as bad as Sterndale Bennett, who—it is said—would finish a lesson by saying "And now go home and play *thousands of millions* of miles of scales!" How often have I heard an earnest worker racing through a passage a dozen times without stopping and quite unconscious that the original fault, whatever it might be, was being engraved and ingrained into the memory of nerve and muscle! In practicing strive to remember that *you are giving yourself a lesson,* and this is an operation more fatiguing than teaching a dozen pupils.

Points to Remember

1. We are striving to acquire evenness of touch. Nature has made all our ten fingers of different degrees of strength. The only way to make them seem of equal power is to

Listen!

2. Keep the little brother (the fifth finger) in mind, and don't let the eldest (the thumb) exhibit his superiority. To do this you must

Listen!!

3. You can never hope that your technic will rival that of the mechanical player-piano, and you ought not to want to. But your touch has a something in it that no machinery can equal. Only

Listen!!!

4. Fingers uncriticized by the ear cannot improve, but only deteriorate unless you

Listen!!!!

5. Don't think of a scale as a sort of pill or patent medicine for weakness of fingers. Rather consider it as the measure of your musical attainment. To estimate that measure you have but to

Listen!!!!!

Self-Test Questions on Mr. Corder's Article

(1) Of what value is scale practice?

(2) Which is the easiest of the scales to play? Why?

(3) How may we introduce variety into scale practice?

(4) What is the most interesting manner of scale practice?

(5) How long should scales be practiced?

Aims a Beginning Teacher Can Have

By W. L. Clark

1. To be sympathetic, yet demand good work from each pupil.
2. To accomplish a definite amount of work in each lesson.
3. To inspire in each pupil a liking for the best music.
4. To teach every lesson thoroughly.
5. To improve her own musical knowledge to some extent each day.
6. To teach a love for the musical profession.
7. To teach each student how to improve his or her own playing.
8. To be a tireless worker, in order to transmit her musical knowledge to those with whom she comes in contact.

Refine Your Musical Senses

By Raymond Thiberge

(The following article has been translated from the *Le Monde Musicale,* Paris, by Edward Ellsworth Hipsher.)

THE success of an intellectual training, as of a musical training, depends on the refinement of the senses. Doctor Desfosses pursues: "Every man, every workman, and especially every artist, every physician, every savant, has also an essential need of an education of his sensorial nervous system, as well as of the education of his cerebral faculties. The holy gardens of art and science are hermetically closed to him who is incapable of placing sharpened senses at the service of a strong imagination.

"The student of medicine, for example, studies theoretically the characteristics of the pulse, the sounds of the heart; then, at the bedside of the sick, patiently, painstakingly, he tries to recognize these; but if his fingers or ears know not to discern the niceties of the phenomena, vain will be his work. He might be able to become an erudite, a living library; he will not ever be a good physician, nor a good surgeon. The sensorial education ought to begin the day of birth and to continue during all the intellectual instruction of which it is the indispensable complement."

I am surely in accord with Doctor Desfosses in saying: Make the children sing from their very young age, and immediately when they are able, have them hear an instrument, at about four, five or six years. Music will supply its portion in their general education, thanks to the progress of modern pedagogy.

Young scholars, beginning pianists, who are served by their senses, without discovering the means of refining them, obtain fatally mediocre results and are for that classed in the category of the unendowed.

Now, precisely, while the old pedagogy left to the pupil the entire responsibility of the refining of the senses, modern pedagogy gives the key of that refinement of the senses, thanks to its cognizance of scientific laws which rule the human faculties. And musical instruction, placed on this ground, is no longer an accessory art, and of optional approbation, but a precious auxiliary in the general training of the child.

The educational rôle which I assign to music would lend again to a large development; for on all these subjects there are some opinions which are spread over France, and likewise the entire world.

How to Recognize Musical Talent in a Pupil

By Earl S. Hilton

VERY often the music teacher is confronted with the question and problem, "Is this child musically talented?" Often the parent of prospective pupils asks the teacher, "Will my little girl or boy be able to learn to play the piano? Is she or he musically inclined?"

The answer to that question is difficult if the teacher has not been a close observer of certain characteristics which reveal musical talent in a child.

A child might have ever so much enthusiasm and desire to learn to play the piano; but if he does not possess certain normal physical attributes, it is impossible for him to reach a good accomplishment of his desire.

Three physical characteristics are most important for natural development to good musicianship.

The first and most important is Good Health. This does not necessarily mean abundant health, but a state of health which is not delicate.

Second is a Wide Brow; the part of the forehead just over the eyes is where most of the mental faculties for music are located. The greater the width at this section of the head, the more naturally its possessor can absorb music. The width can easily be judged by the comparative width of the cheek bones. If the head curves inward at the temples from the cheek bones to the outside of the brows, *then,* musical talent is less than if the outside of the brow is even with the cheek bones.

The third physical characteristic is Prominent Lower Brow at root of nose. This section of the forehead contains the mental faculties for memory and observation, both of which are very important to a person who wishes to accomplish the ability to interpret music. A large bulge at this part of the head indicates a more natural talent for musical grasp and memory than if this section were flat.

"ACHIEVEMENT is not always success, while reputed failure often is."—ELBERT HUBBARD.

Thinking Music

By S. M. C.

THE average student of music is, strange to say, incapable of thinking music, in spite of the fact that tone is an art element through which many a composer has expressed all his life message. His ultimate hopes, doubts, fears, and even the philosophy of his life, have been conveyed to his fellowmen through the instrumentality of the wonderful language of music, if one is but able to hear and understand.

The young musician who has not developed tone perception as a thinkable unit, is groping in the dark. He listens, but hears not; because he has not the power of conceiving music as the emotional expression of some artistic soul.

Teachers find, as a rule, that their pupils learn a piece that they have heard well played, much easier, and with far better results, than one they never have heard. The reason is that the former has entered into the inner consciousness, and this conception or mental image dominates the practice by which they strive to master it. In case the pupil has never heard a piece he is confronted by many difficulties in training his fingers to new uses and positions. The rhythm, too, is often faulty without his being aware of the fact. There is, besides, a lack of musical effect because the student knows not what he is striving after.

If a pupil takes the piece before practicing it, reads every note carefully and tries to imagine the sound of every motive, phrase and chord, it will be a great help to him when he really begins to practice the music.

A student who persists in the endeavor to cultivate his musical imagination by reading his music away from the piano, thinking over it as he would think over an interesting story, will soon find a great improvement in his playing, which will be more expressive and less marred by technical inaccuracies, for these are often due rather to mental than to muscular deficiency.

Sparks from the Musical Anvil

Comments of Contemporary Music Lovers

"IT requires intelligence and imagination to grasp technical principles and to work them out."—MORITZ ROSENTHAL.

"When a man squanders a fortune on race-horses people say, 'What a sport!' If a man does the same in opera people say, 'What a fool!'"—SIR THOMAS BEECHAM.

"No matter how far you have gone, no matter what your position, no matter how loud the applause; never forget to practice, never forget to work."—EMILIO DE GOGORZA.

"The concert halls of today are overcrowded with armies of unsuccessful performers whose ambitions to appear publically have warped and ruined a talent that might easily have become distinguished in a drawing room."—ALBERT SPALDING.

"THE greatest music is that which is universal in its appeal. The greatest Italian music is that which is not characteristically Italian; and Tschaikowsky is probably the greatest composer Russia has produced for the reason that he is the least Russian of them all."—JOHN TASKER HOWARD.

"It is evident that 'ultra-modernism' has fulfilled its purpose and that the problem is now one of order, organization, form. Dissonance and rhythmic freedom are now no longer live issues, and the excitement as well as the usefulness of unorganized novelty (in composition) has passed."—ROGER HUNTINGTON SESSIONS.

"Primarily, opera demands voice; acting is a secondary consideration. I am not among those who believe that the acting should be neglected. If a singer has also the acting talent, that is all the better; but, to act well in opera, and sing badly, that is unforgivable."—ROSA RAISA.

"The American composer who sets to beautiful and convincing music a drama which is vital, serious and exposing the fundamental emotions of humanity will prove that Americanism does not require a distinctly new tonal scale nor is it necessary that we step into the moccasins of Indians or the cabins of Negroes or into the degenerate atmosphere of 'jazz bands' in order to discover the idiom of our souls."—RALPH LYFORD.

The Wives of Great Composers

By EDWIN HALL PIERCE

The great Russian composer, Tschaikowsky, was for a time engaged to Desireé Artot, who was a famous concert singer, and the descendant of a long line of musical ancestry. The engagement, however, was broken, and Desireé married another almost immediately; so did Tschaikowsky; but in his case the circumstances were very peculiar—the girl, Antonina Ivanovna Milyukova, was infatuated with him and "threw herself at his head," as the saying is. He was not in love with her, and after a few weeks of unhappiness and disappointment, they separated. He was a man of very nervous temperament, and entirely absorbed in the pursuit of his art. This is an extreme case, yet in a certain way typical of what often happens. Except in rare cases, like that of Clara Schumann, no woman can really marry a composer, though she may marry a man who makes his livelihood by means of that very difficult and absorbing occupation.

Climbing Into a Cloud

Perhaps the meaning may be made a little clearer by relating an incident which may be taken as an allegory. On a vacation tour on foot through the mountains of Thuringia, with a party of friends, we observed that a mountain which we were about to ascend was wreathed, about half way up, with clouds which shone most grandly in the early morning sunlight. Craving the unusual experience of climbing up into a cloud, we redoubled our pace, in order, if possible, to reach the cloud before it should clear away. Success crowned our efforts, but once there, what was it like? Nothing but a very damp unpleasant fog, not noticeably different from that met with on the low-lands. It was undeniably a grand and beautiful sight, but only when seen from the right point of view—not too close.

Yet most composers have married, like other men, and many of them have been good husbands and fathers. It may be interesting, before we proceed, to give a passing glance at those who have *not* married, and consider their reasons. Handel, for instance, seems to have been utterly absorbed in his art, and to have had no interest in women except as possible sopranos and contraltos. Some would-be wit of his day, remarked cynically that he admired Handel for always keeping his petticoat affairs so hidden; but the sneer was without doubt entirely unjust, for it would have been simply impossible for a man so constantly in the public eye to have love-affairs without the same becoming a matter of gossip.

Beethoven always had the wish to find a good wife; and he was, in spite of his rough manners and untidy appearance, quite popular with the other sex. Though several times deeply in love, he was so unfortunate as always to center his hopes on some lady of noble birth, accustomed to a style of living which he would not have been able to support. Various worldly considerations, therefore, prevented marriage in every case, and he remained a bachelor. Brahms, like Beethoven, was favorably inclined toward matrimony; but, as he explained frankly to some of his friends, in his earlier years his income was too small and uncertain. Later on, when he had become quite well-to-do, he regarded himself as too old. A rather droll incident is related of him, however. When he had already become a somewhat elderly man, he fell suddenly in love with an Italian woman employed as cook at the home of one of his friends, and proposed to her straightway, without any preliminary courtship. She as promptly refused him, and he never pursued the matter further. This appears to have been his only love-affair.

The Much Married Bach

Turning from those who never married at all to one who was very much married: Johann Sebastian Bach. He first married his cousin, Maria Barbara, and they had seven children. While he was away on a journey to Carlsbad, she died suddenly, and when he arrived home he found her dead and buried. They had lived together thirteen years. The next year he married Anna Magdelene Wuelken, daughter of a court-trumpeter. She was a woman of highly cultured musical taste, took a great interest in her husband's pursuits, and helped him greatly in copying out music for his choir (printed music being scarce in those days). In return, there still exist two little books of music which he copied out particularly for her use. They had thirteen children, and spent much care in giving them a good education, intellectually, morally and musically. Several of the sons became musicians of note, though none quite equalled their distinguished father. She outlived her husband, and, sad to say, as a widow suffered from poverty.

Haydn was not so fortunate in his married life. For the fact that he was one of the most cheerful and wholesome-minded of composers, we certainly owe no thanks to his wife, for she was extravagant, ill-tempered, jealous, and everything else that could make a man unhappy. In later years, though he continued to support her, he kept away from her as much as possible. The fact is that in the first place she was, so to speak, rather forced upon him through a false sense of the obligations arising from gratitude. He had been in love with the younger daughter of a wig-maker named Keller; but she became a nun, and her father, desiring to keep Haydn in the family, persuaded him to marry the older daughter, Maria Anna. Now Keller had been exceedingly kind to Haydn when he was a penniless lad seeking his fortune in Vienna; so that is how it came about.

When Mozart, after much ill-treatment by the Archbishop of Salzbury, broke with him and came to live in Vienna, he boarded with the Webers a musical family, the oldest daughter of which was just gaining distinction as a singer. They treated him like one of the family, helped keep his clothes mended, and made it very homelike for him. His father, in a kindly letter, warned him against too great intimacy, as they might think he intended to marry one of the daughters. As he held his father in the greatest respect and reverence, he immediately left the Webers and found lodgings elsewhere, but the outcome of this step proved the very reverse of what was intended by his father. He was so utterly miserable and lonely in bachelor quarters that he decided he ought to get married; and he found Constanze Weber quite ready to agree with him. They were married on August fourth, 1781, in grand old St. Stevens' church, which is still standing in Vienna. Writing his father of the wedding, he says—"As soon as we were married, my wife and I both began to weep: all present, even the priest, were touched at seeing us so moved, and wept too." They were certainly deeply in love with each other, and their love lasted till death. If this alone could have made them happy, they would have been an ideal couple; but they had serious trials to pass through. Constanze was not a good housekeeper; and she suffered a great deal from ill health. They had nothing to begin housekeeping on, and lived like the little birds from day to day, sometimes fed and sometimes hungry. Mozart's income was very precarious. He had no salaried position, and even less sense than his wife about money matters. At one time the king of Prussia offered him a position, at what for those days was a princely salary; but misled by a half-promise from the Emperor of Austria (which was never in the slightest degree fulfilled), he refused to leave Vienna. But it would be wrong to think of them as altogether unhappy.

Love Laughs at Locksmiths

One of the most interesting musical couples of whom we have any record is Robert and Clara Schumann. Her father, Friedrich Wieck, was a distinguished piano teacher. At the time Schumann first met her, he was a student of Law at the University of Leipsic, and had not yet come to the decision to make Music his profession, though he spent really the greater share of his effort and time in that direction. Clara was her father's best piano pupil, and he had great ambitions for her. He had been at first a good friend to Robert; but when he found that he wanted to marry Clara, he turned against him, and put all possible obstacles in the way of their union. We have not space here to tell the whole story; but "Love laughs at locksmiths" and they finally had their way. Clara, in spite of family cares, managed to keep up her piano-playing, and appeared often as a concert pianist, helping greatly to bring her husband's compositions into vogue by producing them on her programs. During the first year of their married life, he also wrote a number of beautiful songs—a line of work in which he had not specially excelled previous to that time. She was not only deeply in sympathy with her husband's aims but also inordinately ambitious for him, urging him constantly to greater and greater efforts. But after all too few years their happiness was cut short by his becoming insane, dying a few months later in an asylum. In after years she used to reproach herself with the thought that she may have urged him too constantly to effort at times when what he needed was rest thus being the innocent cause of his failure of mind. Whether this reproach was just or not, no one knows; but it is a fact that those works written near the end of his life show a decided falling-off of inspiration and occasionally a slight confusion of thought.

One of Schumann's Contemporaries

Mendelssohn was a contemporary of Schumann, and lived in much the same environment; but their music is as different as possible. Mendelssohn appears to have complete control of all means of self-expression and a consummate mastery of the technic of composition; while Schumann is more impetuous, deeper in sentiment, but less perfect in formal arrangement. Those same characteristics show out in their matrimonial affairs. When Mendelssohn was twenty-seven years of age, he met a very attractive young lady in Frankfort, named Cecile Jeanrenaud, the daughter of a French protestant clergyman who had been dead for some years. She appeared to him just about the kind of a girl he wanted, and it might be said he "fell in love" with her, but that would be taking for granted more than Mendelssohn himself felt, for he was so extemely discreet and cautious that, before committing himself in any way, he left town for a month, in order to make sure that it was not a mere passing fancy. His love stood the test triumphantly, and in due course of time they became engaged and afterward married, we may believe happily. Such extreme discretion, however, seems almost uncanny.

After such an example of extreme propriety and virtue, it is rather a shock to consider the affairs of Chopin and Liszt. One must handle the matter a little gingerly in order not to offend the innocent reader. Neither of them ever regularly married, but Chopin, with Madame George Sand, and Liszt with Countess d'Agoult each lived for several years in unions sanctioned neither by church nor state. In both cases, the couples afterward separated by mutual consent. Chopin and George Sand had no children (though George Sand had a daughter living, by her former husband); but Liszt and the Countess d'Agoult had three, one of whom, a daughter Cosima, married first the pianist Van Bulow, and, divorced from him, married Richard Wagner and is still living.

Artistic Helpmeets

Wagner, whom we have just mentioned, married Minna Planer, an actress. Though she was a common sort of a person and had some faults of her own, not the least of which was that she had absolutely no sympathy with or comprehension of her husband's aims and ideals, still she deserves credit for standing by him faithfully in his days of adversity and managing as well as might be on his somewhat precarious and irregular income. Four years after her death, he married Cosima, Liszt's daughter and their life together appears to have been in every way happy. Some account of their family doings, most interesting to read, may be found in an article by their son, Siegfried Wagner, in The Etude for January, 1924. Madame Wagner has now been a widow for many years, but she finds congenial activity in managing through her son the great Wagner Festival which is held at Beyreuth every two years. Coming from an environment where her husband's aims and deeds were already understood and honored, she was able to see them in their true light and to enter into his work, even after he had passed on.

One might, with truth, say also, some very pleasant things of a similar nature in regard to the wives of Grieg and MacDowell, but space would be lacking, in the present article, to do justice to the subject.

Special Self-Test Questions on Mr. Pierce's Article

1. *Name three great masters who remained unmarried.*
2. *Was Joseph Haydn happily married?*
3. *Name three great composers whose wives were a great inspiration and happiness to them.*
4. *What daughter of a famous pianist married a great composer.*

"Many artists have an idea that music is not appreciated outside the larger centers; but nowhere have I played with greater success or more personal satisfaction than in some of the smaller towns."—Hans Kindler.

* * *

"One's dignity as an artist is just what one makes it. Many singers look with askance upon an engagement in a motion-picture theater, but it was my work at the Rialto and Rivoli theaters that led me straight to the Metropolitan. One should not be above doing the best that can be had at the moment, no matter what, for it may be a stepping-stone to something better. One should remember that Olive Fremstad, Louise Homer and many others began their careers as church singers."—Jeanne Gordon.

Drudgery

Francesco Berger

We read frequently, I would almost say constantly, of this or that new method purporting to remove the "drudgery" of practicing scales and finger exercises. These widely advertised methods propose to substitute new and untried ways for the old established ones that have proved successful during generations.

It is not intended, in these lines, to sit in judgment on these pretensions. My motto is "Let them all come." They all tend in the same direction, though by differing routes, and so long as we reach Rome, it does not seriously matter by what road we travel there, nor by what conveyance. Liszt and Thalberg, Chopin and Paderewski got there by the same mode of locomotion that also safely deposited Bach and Mozart, Hummel and Clementi. Those who prefer to journey by aeroplane must take the risk of unforeseen disaster, and perhaps, on arrival may discover that they have forgotten to provide themselves with the requisite equipment, which is "finger work."

What is objected to in these remarks is the use of the word "drudgery" as applied to the necessary amount of preparation for a finished performance. The true music-lover, the sincere music student knows no such word. Labor is not drudgery if undertaken in the correct spirit. There is hard labor for the criminal, but for the enthusiast in any vocation there is only the labor of love.

Let us suppose a mountain, and your ambition be to climb it. Why you should have such a desire, is the secret of your breast. There are other ambitions equally locked in other breasts. There is the ambition for the acquisition of wealth. There is the ambition to occupy the highest place in some woman's affections. There is the ambition to gain a prize for your fat little puppy at a dog show. But since yours is to reach the summit of that mountain, would you call the labor of its ascent "drudgery?" Certainly not. You either have, or have not the wish to accomplish your self-imposed task. The prospect of achieving your purpose is your present delight and this is but fore-taste of that keener delight, which you will experience when you stand on the top, and look back, and look down—back at the difficult steps you had so carefully to choose and down at the landscape which only great elevation can reveal.

Sufficient

If you have been steadfast of purpose, unchanging in desire, determined in will, the labor entailed is but the proper, the commensurate, price you have paid for the gratification of your wish. You might as reasonably expect your fishmonger to hand you his salmon without your paying for it, as expect to gain anything worth having without his incumbent effort.

Proficiency in music cannot be acquired without daily work. But this daily work can be much lightened, if the task be made interesting, and relieved of monotony. Once get rid of monotony, and the labor will shrink—the work will gain in interest.

Suppose that in preparing a piece, you could not for the life of you, execute a certain passage a month ago. Instead of throwing up the job as hopeless, you persisted in your endeavor to overcome it. Little by little, perhaps very little by very little, but still step by step, however small each one, you made headway with it. It is astonishing what perseverance will accomplish. You separated the Right hand from the Left, and worked at each alone. When one grew tired, you worked at the other, and when weary of the second you returned to the first—always deliberately avoiding the fatal mistake of imagining that incompetence in one hand can be *covered* by proficiency in the other. From the start, you have remembered that two impossibilities *cannot* produce a possibility.

Then, you tried the same difficult passage with different fingerings, not only with that marked in your copy, or by your professor. You endeavored to discover which, of several reduced the difficulty most, and you adopted it, stuck to it, forced your reluctant fingers to adjust themselves to it. You analyzed the fingering you had selected, compared it with others, and realized its superiority From the outset you have submitted to the universal rule, (the only *safe* one), of practicing *slowly* at first, and of increasing the speed by *slow* degrees. You have not jumped from a slow pace to a quick one, but have carefully studied the intermediate gradations. Soon you found (probably sooner than you had expected) that the difficulty wore off, that your night of fear and doubt and inability was departing, and the dawn of brighter hours was breaking. Your hands could be trusted to grope and glide, to stretch and contract somewhat "of their own" from sheer force of habit. After a while you ventured to fit them in together, and discovered that it could be done, though still slowly and with circumspection. Phrases began to emerge from primitive chaos, music commenced to evolve from fragments. From toddling, your hands had progressed to stepping, and from stepping they were progressing to walking and were on the way to eventual striding. You could now gradually "get up the steam" of increased pace, and could probably in part if not completely, dispense with the printed page, without being conscious of having made any special effort to "memorize." And all this has been a gradual process, an absorbingly interesting development, a delightfully encouraging experience. No drudgery.

Nothing As Important As Scales

Are scales necessary? To this oft-asked question there can be but *one* obvious answer: "Unquestionably they are." And for this reason there is nothing else that can take their place. They create equality of fingers, they teach passing the thumb under the other fingers, and passing the hand over the thumb, they strengthen the fingers, they give endurance to the arm, they induce velocity and lightness of touch as well as depth of impact, and they engender familiarity with the twenty-four tonalities. They and arpeggi, in all tonalities and in all positions are the very foundation of pianism. *There is nothing else.* The student who can play all the scales, and all the arpeggi, *as they should be played,* has learned more that will help him to become a fine pianist than all the Liszts and Chopins in the world could have taught him

It is the too frequent repetition of *one* particular scale that causes monotony. The same amount of labor distributed over several scales will not do so. Therefore the student should adopt some system of practice which obviates this monotony. One excellent plan is *not* to practice them in the order generally found in the text-books. The plan of no sharps, one sharp, two sharps, three and so forth; one flat, two flats then three, and so forth is undesirable. Apart from other drawbacks it often results in ability to play a scale correctly in *that* order, but in complete breakdown when an *odd* scale is in question.

Here is a remedy,—take the scales in the following order: C major and C minor, B major and B minor, B flat major and minor, A major and minor, and so on, by descending semitones, till the whole twenty-four tonalities have been gone through. And let this order, or its reverse, be applied to arpeggi. Let students *vary* their work as much as possible. Some such method as the following may serve the purpose: A, scales in contrary motion; B, arpeggi in parallel motion; C, scales in double thirds; D, scales in parallel motion; E, arpeggi of dominant and diminished sevenths in parallel motion; F, the same in contrary.

There are a few golden rules which may be here added with advantage:

Do not practice longer than *two* hours at one stretch.

Do not play *with* the Piano, but *on* it.

Listen to yourself as critically as you would to others.

While having complete confidence in your teacher, rely as much as possible upon your own exertion.

Play only *good* music.

Do not neglect your health, fresh air and moderate exercise conduce to it.

Let your practice be regular, not spasmodic. A fixed amount of practice *every* day, will bear better fruit than an excess today and no practice tomorrow.

A day of complete abstinence from practice is a lost day, and many such spell disaster.

Our Left Hand Weakness

By E. F. Marks

We students of the pianoforte, realize the weakness of our left hand, unless so fortunate as to possess ambidexterity. This is caused no doubt by the constancy with which we are early taught to utilize the right hand in preference to the left.

In order to overcome this usual and perhaps unconscious tendency of the mind to turn to the dextral members of the body in advance of those on the left side, we should direct and train the first impulse of the mind to be centered upon the weaker members of the left side. In regard to the left arm or hand, probably the easiest and best opportunity to gain the ability to use these members with greater facility than the right is in our technical exercises, where we do not have to focalize our attention on a page of sheet music for notes but are in a position to devote our entire attention to physical action on a few well-known keys of the instrument.

Take an exercise, even for the five fingers, and compel the left hand to perform this first alone. Likewise, if the chosen exercise is a scale or arpeggio, always make the left hand undertake the manipulation prior to the right. By following this simple method the mind soon will accept the new order of things and give the left hand the priority of attention.

After devoting endeavors to giving the left the primal attention for some time in such simple exercises, take up a new piece of music to read and play at sight. Observe how much easier and quicker the left hand will perform its allotted task, than before practicing in this manner. Continuation in this method, with the left hand leading, will ultimately result in ambidexterity, especially in piano playing, and the left hand will come into equal power and fluency of action with the right hand.

The weakness of the fourth finger, not only of the left hand but also of the right, is recognized by all of us. As employment of a muscle develops strength, it is profitable to use the fourth finger as often as possible. For this purpose, a simple five-finger technical exercise, suitable for each hand, is as follows:

1-4-2-4-/3-4-5-4-/5-4-3-4-/2-4-1-*-/

which may be played in 2/4 tempo. In order to make the exercise somewhat melodious, let the thumb of the left hand begin on the fourth (subdominant) degree of the scale, and the thumb of the right hand on the first (tonic) degree. Play each hand separately, the left hand always receiving precedence over the right in having bestowed upon it the first of our attention. Persistence in this exercise will show a marked improvement in strength and management of the weakest finger in a short while.

Hail to the Adults!

By Edith Paul Graham

Music really has a wider purpose than the training of virtuosos. It means the heightening of vision, the deepening of hope, and the broadening of appreciation. Why shouldn't the whole world be blessed?

Everyone learns to read and write, though few make their living that way. We would not deny even a centenarian the privilege of learning to read so that he might in some degree "learn how" to enjoy himself. Why deny people who have grown old physically the happiness of keeping young the emotions? Music is to the emotional life what learning is to the mental. There is no better way to learn the value of music than by the actual study of music.

Always the older pupils more than repay their lack of muscular ability (velocity, of course, being quite out of the question) by their zeal and by the unalloyed pleasure they themselves receive from their lessons. An older pupil must be very brave to face the sarcasms of his family and friends plus the frowns of music teachers that he may worship at the feet of Orpheus.

Give him a chance!

Do not hold out to him the hope of ever becoming a Hofmann or a Paderewski; but you can, in justice to both yourself and pupil, give him the hope of acquiring finer, broader, and more sympathetic life than he otherwise would have enjoyed.

Thousands of Successful Teachers Depend upon The Etude Music Magazine to Bridge the Pupil's Musical Interest from June to September. Subscriptions Started Now Will Provide the Student with a Wealth of Captivating Features Which Will Induce Him to "Start Lessons" in the Fall with Even Greater Zest. The Etude Will Be Very Entertaining this Summer.

The Teachers' Round Table

Conducted by PROF. CLARENCE G. HAMILTON, M. A.

This department is designed to help the teacher upon questions pertaining to "How to Teach," "What to Teach," etc., and not technical problems pertaining to Musical Theory, History, etc., all of which properly belong to the Musical Questions Answered department. Full name and address must accompany all inquiries

The Hand Touch

> Will you please explain to me the Hand Touch and the various uses to which it may be applied in playing? I am acquainted with Dr. Mason's *Touch and Technic*, but the explanation of this touch given in Book 1 is not clear to me. Dr. Mason says that in the Hand Touch the impulse comes from the arm and not the wrist. Kindly tell me in what part of the arm this impulse is centered, whether near the wrist or near the elbow.
>
> Can you suggest any book that gives a better explanation of all the touches used in piano playing?—E. D. A.

I have recently written about the hand touch for the Round Table, but will add a few more words to make the subject clearer.

Here are two experiments for you to try:

(1) Place your finger tips on a table, with the fore-arm and hand held horizontal from the body. Now raise the hand upward from the wrist, and then slowly lower it. These movements you have performed by means of the muscles located in the wrist, and, as Dr. Mason says, it is *not* the hand touch; in fact it is a touch little used by modern pianists.

(2) Hold your fore-arm horizontally before you in free air, letting your hand hang down absolutely relaxed from the wrist. Now, by using the large muscles of the upper arm throw your fore-arm a few inches up and down, so that your hand is loosely thrown with it. It will help if you will imagine that you are shaking water off the ends of your fingers.

Continue this experiment by first placing the fingers on the table, as in experiment 1. When the hand is then thrown by the action of the fore-arm, it is interrupted on its way down by the table-top; and there is a consequent reaction on the wrist which should jump up suddenly, for an inch or two.

Observe that this *is* the hand touch, produced by the action of the arm and not of the wrist.

You may amplify its details at the piano by sounding a key with each finger separately, taking care that the hand is always loose at the wrist and that the reaction on the wrist always follows the finger stroke.

This, which is by far the most important of all the touches, is used for nearly all passage work. It may, in fact, be compared to the violins in the orchestra, which stand for fluency and dexterity. For very light playing, the simple finger touch may be employed; and for melody work the full-arm touch is better used.

A book called *The Mechanism of Piano Technic*, by E. W. Grabill, treats extensively of the hand touch. For an exhaustive discussion of all the piano touches and their uses, see Tobias Matthay's *The Act of Touch.*

Self-Confidence in Teaching

A correspondent, who is a teacher of considerable experience writes me that she is discouraged because to a bright young pupil of nine years she has been giving work that is evidently too advanced. "What have I been leaving undone?" she asks. "Perhaps all are tempted to give too difficult work too often."

All of us indeed, have the ticklish task of navigating our bark between the Scylla of too easy work and the Charybdis of work that is too difficult. And it is not strange that we occasionally founder on the rocks at one side or the other.

Because we are eager to do our utmost for our pupils, however, the chief danger lies in the direction of too difficult, rather than of too easy work. All honor to the teacher who, in this predicament has the cleverness and good sense to back down gracefully and start on another tack!

I remember how, in my student days, I began with a new teacher who gave me for my first piece Chopin's *Andante Spianato*. "This may seem easy to you," said he "but I always prefer to shoot under, rather than over the mark." Here is good advice for all teachers, especially in dealing with a new pupil—advice, too that will save a lot of after regrets. If in doubt as to which of two studies or pieces to give, choose the easier, and you will not have to retrace your steps.

But having committed the error of giving material that is too hard—and every doctor sometimes gives injudicious medicine—what shall we do about it? I do not think that it is wise to tell either the pupil or his parents that you have made a mistake. Their confidence in your judgment would be considerably shaken, and you would be in the position of a general who has lost a decisive battle, and who has thereby proved to his troops that he is not invincible. Better quietly to shelve the offending piece, and change for a time to something quite different. Pupils like changes anyway, especially when they find the problem a knotty one; and you can simply suggest the advantage of getting a new point of view.

In other words, do not acknowledge defeat, even to yourself. There must be something somewhere which is exactly adapted to the pupil's needs. So "try, try again," until this desirable object is found.

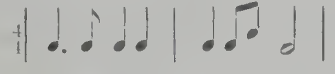
In many cases, too, the trouble comes from piling too much work on a pupil. We begin, say, with a short lesson-assignment. But as time goes on we add a review portion, and then a back-review, and then a back-back-review, until the pupil is snowed under the mass of material. A music student complained to me once that she simply couldn't get through her lessons in the time which she could devote to them. I asked her to show me her latest assignment, and found that it comprised twenty pages of music, each one of which deserved meticulous study. And for this stupendous amount she had available but two hours per day for a week!

Consider, then, both the grade and the quantity of your assignments, and forbear to overshoot the mark in either one of these. For how much more satisfactory is a half-page well learned than ten pages scrambled over! Not only keep a tight hold on your self-confidence, but also make the pupil share that feeling, so that, whatever difficulties arise, he will feel sure that you can help him through them. When, in sailing up the Hudson River, our boat nears West Point, it looks ahead as though the mountains were shutting off all further progress. But soon we pass through a passage that is narrow, to be sure, but that readily leads to the broader waters beyond. So there is always a solution of our problems, if we only search diligently enough; and the solution always lies in the direction of perseverance and self-confidence.

Counting

> I have pupils that refuse to count. They keep perfect time when I count for them; but please tell me how I can get them to count for themselves.

Pupils will seldom assume a responsibility unless they are obliged to do so; accordingly, they will not count so long as you are willing to do it for them. Counting is a habit which must be cultivated by constant practice. Take some simple rhythm, such as this:



Write it for the pupil and have him play it on Middle C with one finger, over and over, counting aloud distinctly. Exploit some of the principal rhythms in the piece he is learning in this way, and then let him play the part for each hand alone, counting throughout. This process should lead him to the point where he can play with both hands and still count aloud.

And remember, in counting as in everything else, not to do anything for a pupil which he can be taught to do for himself!

Graded Courses

> Is it essential for one to play all the exercises in any one volume of Matthew's *Graded Course* before taking up the next higher grade?—E. A.

Graded courses of studies are necessarily written for the average pupil; hence they often advance too quickly for the slow pupil and too slowly for the quick one. It is therefore quite proper and wise for you to skip any material in the course you mention (or, for that matter, in any other course), and thus hasten your advancement. Only be sure that you are not omitting something of intrinsic value to yourself. Perhaps a good test would be to try to play at sight the doubtful exercise. It if goes easily, and contains no evident snags, you may pass over it for the next.

"Music is almost all we have of heaven on earth."—ADDISON.

Correct Fingering

In a letter from one of our Round Table members, Mrs. H. C., she says:

> I started teaching about four years ago, and enjoy the work very much, regardless of all its problems. I have a class of nineteen pupils, mostly all beginners. The hardest problem seems to be to make the pupils get the correct fingering. I go over the pieces and exercises at each lesson; but nevertheless when I come back the next week the fingering is wrong. I don't know what to do, for I cannot sit comfortably beside them and see such mistakes. "Do it again," is my motto—but they get so disgusted, and sigh terribly!

Pupils often seem to feel that the only really important object in playing is to sound the right notes. To counteract this misconception, I suggest that you impress upon them the fact that to play any note correctly four things are necessary: (1) to hit the right key, (2) to use the correct finger, (3) to play the note in the correct time relative to other notes, and (4) to use the correct touch, so that the tone is given its proper quality and quantity. Or, as you may write it in their note-books:

"Stop, look and listen" for correct

1. Notes
2. Fingering
3. Time
4. Touch

Why not, with your younger pupils at least, try the scheme of marking a pupil at each lesson on the four points listed above, giving a maximum of twenty-five credits for each point. Some teachers have gained excellent results by presenting to each pupil a blank card, on which a star may be pasted at each lesson, indicating the credit value of the work accomplished; a gold star for 90 to 100 per cent, a silver star for 80 to 90 per cent, a red star for 70 to 80 per cent and a blue star for 60 to 70 per cent, below which no star will be given. For specially high credit work during ten or more lessons, a prize may be offered. Perhaps the thought of these rewards may mitigate the heart-rending sighs of which you speak!

Besides this system, be sure that the pupils start right. In assigning a new passage for practice, go over it in advance, playing the part for one hand while the pupil plays that for the other, insisting, meanwhile, on attention to fingering as well as to the other necessary points. And, by the way, don't follow the given fingerings too slavishly. If you can better them in any way, specify the changes for the pupil. Also, if the pupil uses fingering different from that given that is not objectionable, let it pass, requiring him, however, to mark his revisions on the music, and having marked them to stick to them.

You ask my advice also about "forging ahead" with your own music work. Your letter convinces me that you have the qualities of accuracy and enthusiasm which are necessary to produce a good teacher. I like your motto, "Stick to it until every obstacle is overcome"—even though that millennium may be long in arriving. So I say unhesitatingly, "Keep on, by all means." Piano teaching is full of problems that are ever new and unexpected. But it is the joy of overcoming these very problems which makes the work perennially interesting. So I bid you God speed in your work!

The Sarmatian Composer

> James Huneker, in his preface to a Chopin polonaise concludes by saying:
>
> "Before Chopin, the Weber polonaise was the most interesting; but the master of all is the *Sarmatian* composer."
>
> What I desire to know is, does the word Sarmatian refer to Chopin or to still another composer?—J. R. J. McS.

It refers to Chopin. Sarmatia is a name given to ancient Poland; hence Huneker here uses it as a poetic reference to the land of Chopin's birth.

Huneker possessed an unlimited and unusual vocabulary, which he loved to lavish in praise of his favorite composer, Chopin. Some people who lived within earshot of his piano asserted that he always began his playing by a portion of Chopin's Revolutionary Étude! You should read his entire book about Chopin, if you have not already done so.

The Musical Scrap Book

Anything and Everything, as Long as it is Instructive and Interesting

Conducted by A. S. GARBETT

PLAYING FOR GOETHE

Mendelssohn was not the only child to delight Goethe, the great German poet, with his music. When Clara Wieck (afterwards the wife of Robert Schumann) was eleven years old her father took her to Goethe in Weimar and gives the following account of the visit, in his diary (translated by Berthold Litzmann in his book on Clara Schumann).

"On October 1, at 12 o'clock, we had an audience with the 83-year-old Minister, his excellency, von Goethe. We found him reading, and the servant took us in without further announcement, as he had made an appointment with us the day before for this hour. He received us very kindly. Clara had to sit by him on the sofa. Soon afterwards his daughter-in-law came in with her two very clever-looking children of 10 and 12. Clara was now asked to play and as the piano-stool was too low Goethe himself fetched a cushion from the ante-room and arranged it for her. She played Herz's *La Violetta.* While she was playing more visitors arrived and she then played Herz's *Bravura-Variations,* Op. 20. Goethe estimated these compositions and Clara's playing very justly, spoke of the pieces as bright, French and piquant, and admired Clara's intelligent rendering."

She was asked to visit Goethe again and Goethe gave her a bronze medal of himself. Of her playing the aged poet wrote to Mendelssohn's teacher, Carl Zelter, saying: "Yesterday a remarkable phenomenon appeared before me: a father brought his daughter (a pianist) to see me. She was on her way to Paris and played some recent Parisian compositions; the style was new to me: it demands great ease in execution, but at the same time is always light; one listens readily and enjoys it. As you are certain to understand this sort of thing, please explain it to me." [The notion of the great poet needing to have the trivial music of Herz explained to him is not without humor.]

When Carissimi was praised for the facility of his writings and the charm of his melodies, he was wont to answer, "Ah, you do not know how difficult it is for me, this facility."

MOUSSORGSKY, THE MUSICAL RADICAL

In music as in all art, there is constant war between those who make technic the end of everything, and those who detest restrictions of any kind. Moussorgsky, composer of "Boris Godounov," and perhaps the most significant of modern Russian composers, was greatly handicapped by his lack of technic. He loathed the drudgery of study and suffered in consequence, as all must who try to shirk it. Nevertheless, it is possible to overestimate the importance of technic and, for those who do so, the following quotation from a letter of Moussorgsky to Stassof, written in June, 1872, may be of value. The translation appeared recently in an article on Moussorgsky by M. D. Calvocaressi in *The Musical Quarterly*:

"Admitting that I shun technic, does it mean that I am no good at it? When I eat a good pie, do I want to behold how much butter, how many eggs, cabbages and fishes went to the making of it? The proof of it is in the eating. . . .

"Indeed, so long as the composer remains harnessed to the conventions, the autocrats of symphonic working out will continue to reign, enforcing their Talmud as the *Alpha* and *Omega* of art. Meanwhile wise people feel that their rules have nothing to do with live art. Let us have space; the world of music is boundless. I do not object to symphony, but to the symphonist, the incorrigible conservatives."

AT A DE PACHMANN RECITAL

Vladimir de Pachmann has been among us again, and the veteran pianist has lost none of his mannerisms nor his charm, according to Katharine Lane Spaeth, writing in the *Theatre Magazine.*

"'You see, I play this passage very softly, pianissimo, and not boom! boom! as some pianists do. That would not be fair to Chopin,' Valdimir de Pachmann told his first Carnegie Hall audience. And those who came to be enchanted by the still nimble fingers of the keyboard veteran, remained to gasp and giggle. He delivered Beethoven with buffooneries, and Chopin with chatter until it was hard to know whether you listened to one of the master pianists grown gray in the service of art, or to a one-man vaudeville act.

"Certainly the heavy de Pachmann eyebrows must have been quite as tired as his hands. He used them constantly to punctuate his explanatory talk. Lifting his arms high above the piano during the second movement of the *Sonata Pathètique,* he turned impressively toward the audience. 'Now listen! I shall play this melody beautifully!' Well, and so he did. For despite his childish and often ridiculous prattle, de Pachmann still has magic in his fingers and wrists. He got no sturdy climaxes, but he spun out a silken thread of tone into lacy cobwebs of sheer beauty.

"Once when the applause grew tumultuous, demanding another Chopin encore, he gesticulated violently. 'The hand and the brain are still there, but the wrists get weary,' he said, pointing to the three members as he spoke. There was wisdom as well as wit in his response to the noisy handclapping that followed the Beethoven sonata. 'That sonata was enough,' he decided. 'An encore would be too much.'"

BRAHMS' WAY OF COMPOSING

"There is no real *creating* without hard work," the great composer Johannes Brahms told Georg Henschel, who quotes him in a little book called *Personal Recollections of Johannes Brahms,* published by Henschel some years ago. "That which you would call invention, that is to say, a thought, an idea, is simply an inspiration from above, for which I am not reponsible, which is no merit of mine. Yea, it is a present, a gift, which I ought even to despise until I have made it my own by right of hard work. And there need be no hurry about that either. It is as with seed-corn; it germinates unconsciously and in spite of ourselves. When I, for instance, have found the first phrase of a song, say (and here he quotes the first two measures of *Die Mainacht,* Op. 43), I might shut the book then and there, go for a walk, do some other work, and perhaps not think of it again for months. Nothing, however, is lost. If afterward I approach the subject again, it is sure to have taken shape; I can now begin to really work at it. But there are composers who sit at the piano with a poem before them, putting music to it from A to Z until it is done. They write themselves into a state of enthusiasm which makes them see something finished, something important in every bar."

Brahms' method was allied to that of Beethoven, who often "nursed" a theme for years before working it up into a sonata or symphony. On the other hand, Schubert, Schumann, Mozart and Mendelssohn frequently poured out masterpieces with great rapidity. Schubert, in particular, composed *The Erl-King* and *Hark! Hark! The Lark!* complete, immediately after reading the words that inspired him.

POOR RICHARD: MUSIC-LOVER

In addition to inventing the "Armonica," or musical glasses played by Gluck among other musical celebrities of the day, Benjamin Franklin had ability on other instruments, Mr. O. G. Sonneck includes in his volume of essays, *Suum Cuique,* one on "Benjamin Franklin's Musical Side," from which we glean the following:

"The Armonica, however, was not the only instrument Franklin enjoyed and knew how to play. Mr. Ford claims that previous to the development of the Armonica he also knew how to play on the harp, the guitar and the violin; and Mr. Parton adds to these instruments the violoncello. I have been unable to verify Franklin's proficiency on the violoncello and violin, but he may have been a harpist, for in France a friend wrote of him that he had 'searched for harps everywhere without being able to find any.' Certainly, Franklin, like most gentlemen of his time, knew how to play on the guitar. 'I shall never touch the strings of the British lyre without remembering my British friends, and particularly the kind giver of the instrument,' he wrote from Philadelphia (Dec. 7th, 1762) to Mr. Whiteford, who congratulated him upon the marriage of his son, William. He even offered his services as a guitar-teacher to Leigh Hunt's mother, but she was too bashful to become his pupil—so her son informs us in his biography.

"That Franklin attended concerts and operatic performances while abroad is certain, and it seems as if he saw Handel conduct 'The Messiah' for the last time, eight days before his (Handel's) death, on the sixth of April, 1759. At least I reached this conclusion from remarks made in Mr. James Parton's biography of Franklin (1, pp. 260-262, 397):

"'Franklin was just in time to see the sublime old man, one of the sturdiest characters of modern times, led to the organ for the last time, and conduct one of his own works. He heard Handel's oratorios, and his now forgotten operas, always with admiration, but not with blind admiration.'"

A VENETIAN FESTIVAL

Pierre Loti, the French sailor-author and prose-poet, was a well-trained musician. In a recent article by Frederick Martens, in *The Musical Quarterly,* he is quoted extensively, and from this the following unforgettable picture of a music festival on the Grand Canal in Venice, is taken:

"Our music meanwhile had arrived; a large gondola, illumined with a profusion of lanterns, and containing a double string quartet, a chorus and two solo singers, a contralto and a tenor.

"The illuminated gondola moved off as soon as we had seated ourselves within that of the Queen (Carmen Sylva), and we followed. The black dais had been removed and . . . then began, in the wake of this music, a slow wandering promenade . . . as a number of other gondolas augmented our floating processional, and all these silent unknowns, gliding behind us, listened to the serenade.

"It vibrated, facile and langourous, this Italian music; at times it mounted in anticipated *crescendos,* into the sonorous tranquillity of night, re-echoing from the marble walls of the palaces; or else it diminished and seemed to die, little by little, of its own languor. The voices were fresh and vibrant, and led with that innate skill shown in this country by even the least among singers.

"A people's music is intended to be heard in the place of its birth, in its natural framework of echoes, of odors and skies. Even this Italian music which is inferior in the most absolute sense, may become profound and charm the soul when heard at night, as we heard it, coming to one with the unexpectancies of distance and echo, from a gondola fleeing, ever fleeing, and which one follows, stretched out, with an unequal and oscillant motion sometimes nearby, sometimes far away . . . amid the splendors of Venice beneath the moon and the summer stars."

PLAYING BY EAR FOR LESCHETIZKY

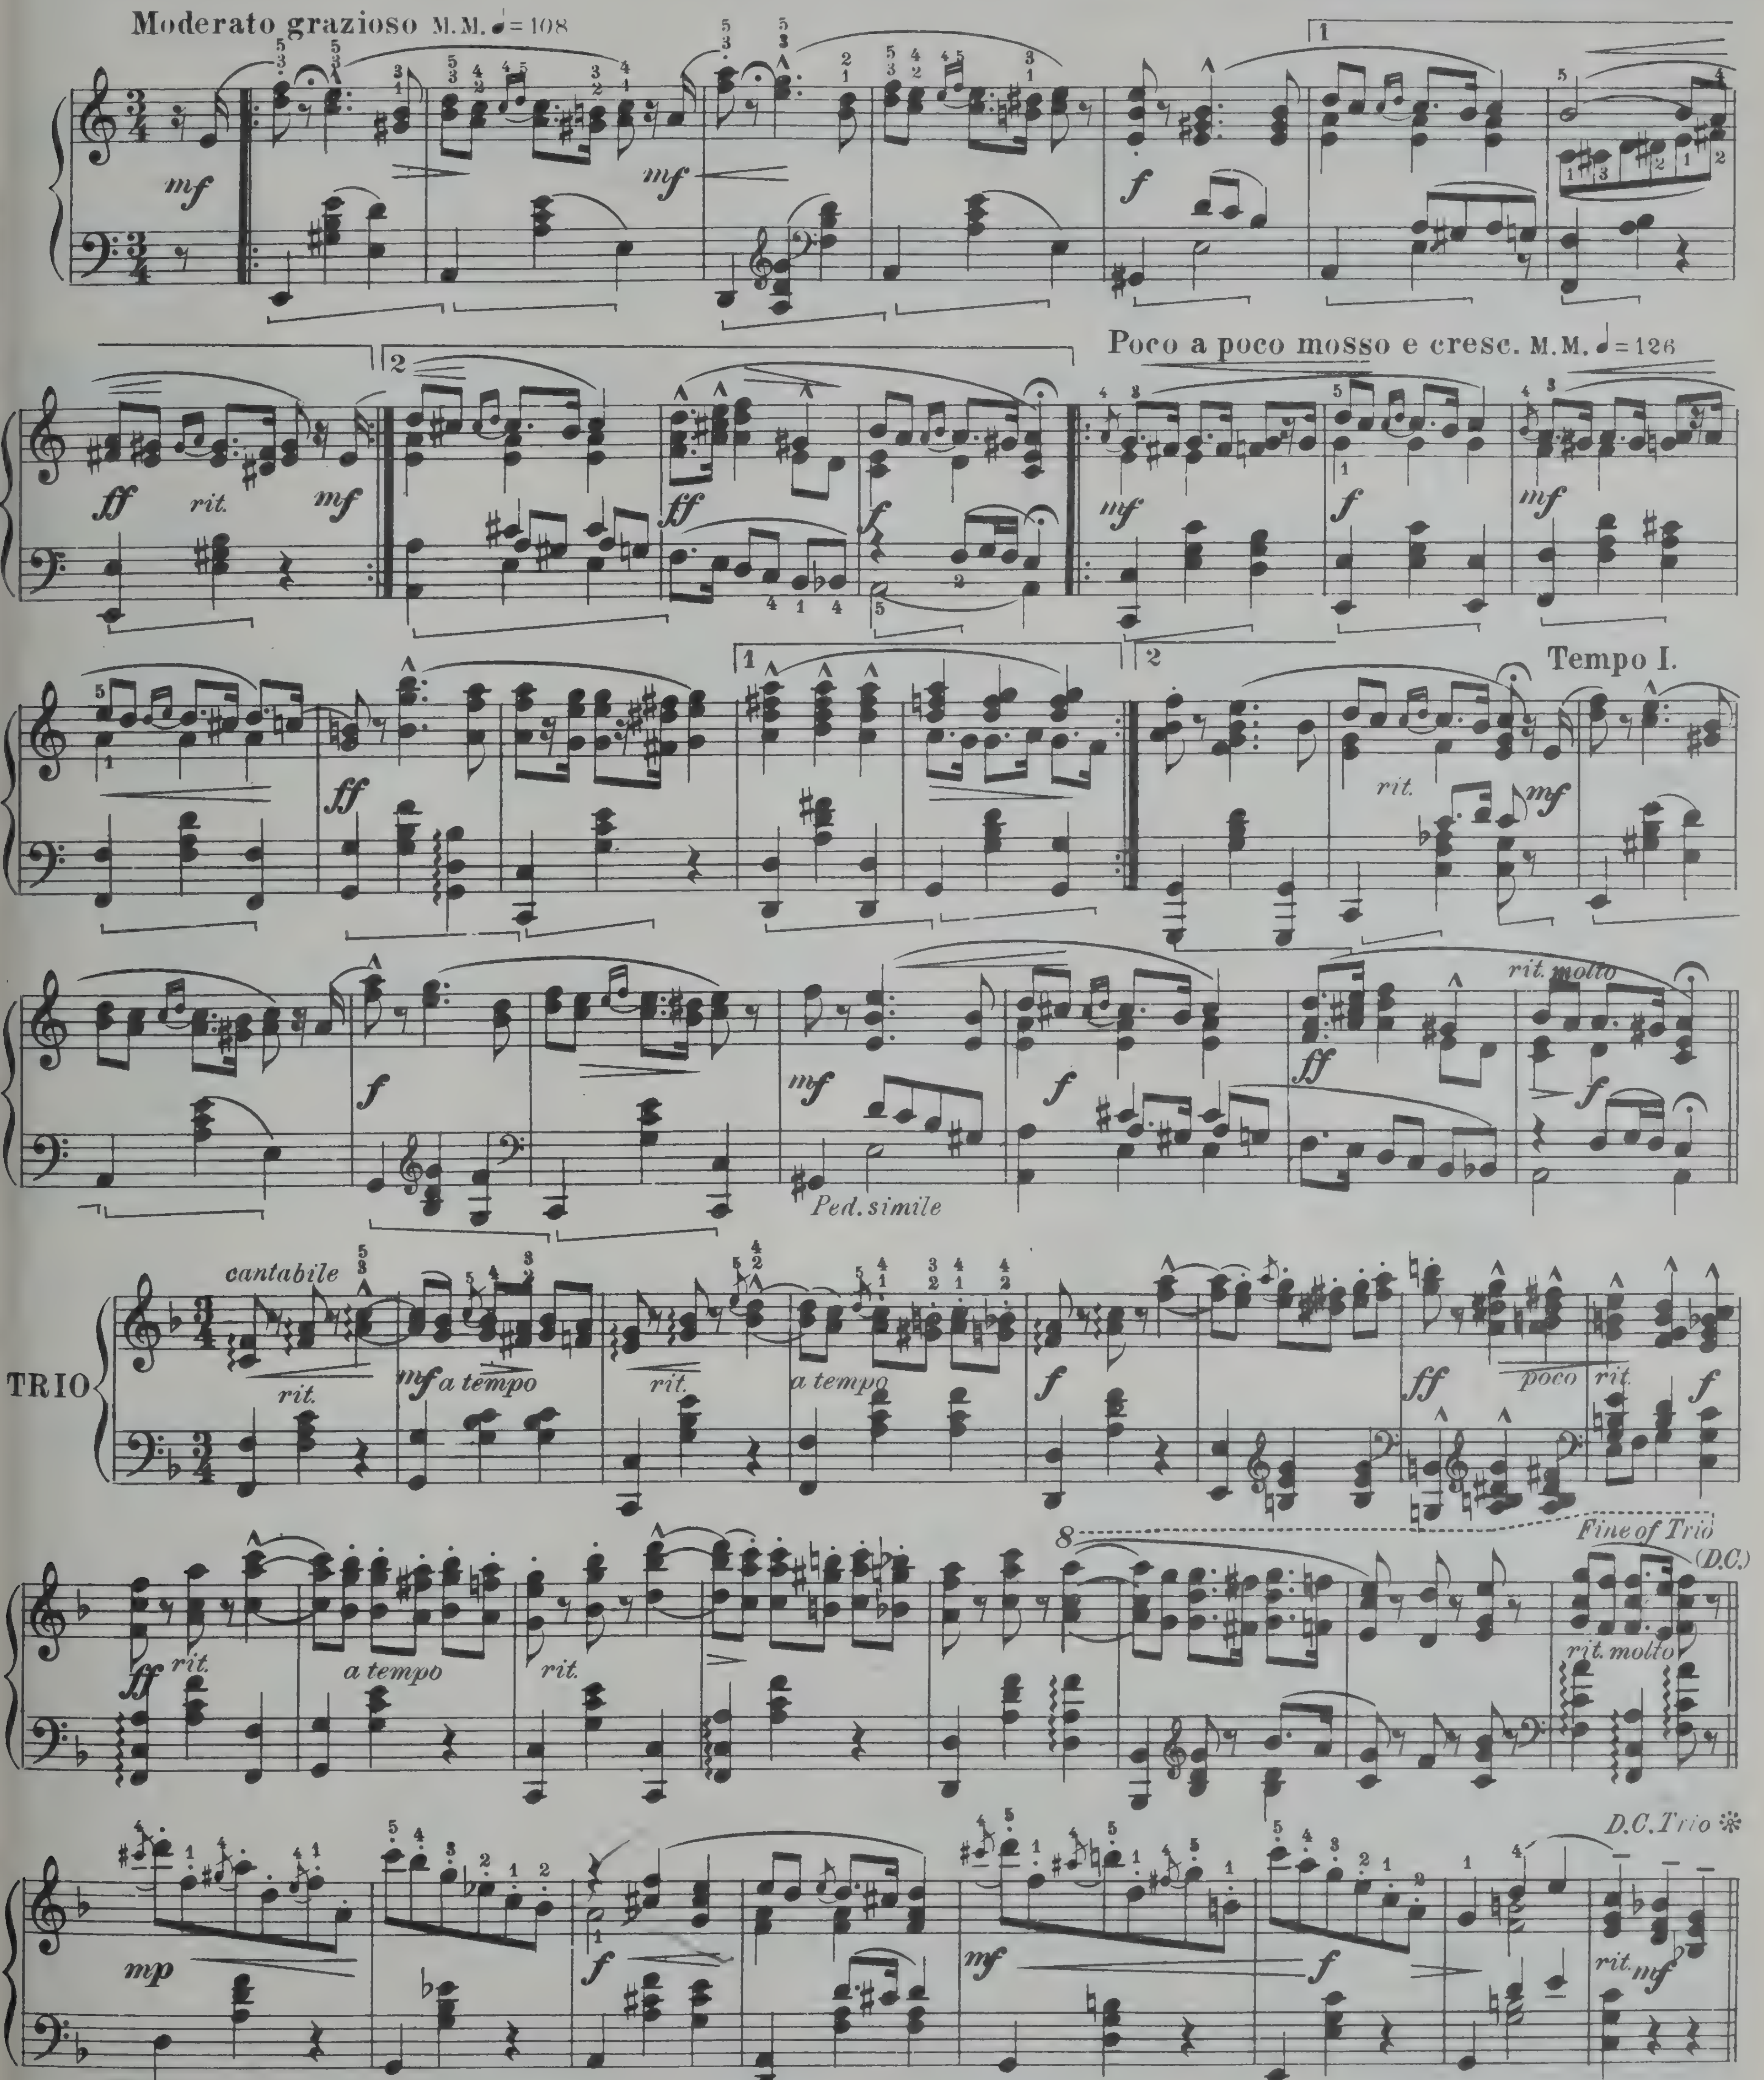
"Playing by ear" is often frowned upon by teachers who fear that it may lead to slipshod methods, but, in *Leschetizky As I Knew Him* by Ethel Newcomb we get an interesting sidelight on this question. "One day a charming Londoner asked permission for an interview," she writes. "His interview became a pleasant conversation with Leschetizky, who rather prolonged it than otherwise, fearing to break the spell by approaching the subject of music. But the excuse for the visit being music, he was invited to play. What was Leschetizky's astonishment to hear him play faultlessly and with expression his own piece, *The Two Larks.* On being asked to play further, the visitor announced that it was the only piece he had ever played. He said he had improvised all his life, but wanted a real accomplishment for the London season. 'This is something new to me' said Leschetizky. Students who cannot play at all by ear I advise most earnestly to cultivate that quality. Many pianists deplorably lack it, and should try playing simple tunes entirely by ear, training themselves to the habit of improvising also especially when the memory fails, as it sometimes does in pieces. These students study too much from the theoretical side. But you know nothing of the theory of music, and do not intend to study it, and have been taught one piece entirely by ear. 'I will give you a few lessons myself,' said the master, all curiosity and interest. 'You asked for permission to study with an assistant; I shall take great interest in learning myself what can be done by ear alone.'

"These lessons were a pleasant diversion to Leschetizky, who taught him a Chopin nocturne entirely without notes, and the pupil returned to London playing very beautifully this addition to his repertoire."

HUNGARIAN DANCE

In true Hungarian style, not a *mazurka*. The *tempo* is somewhat free. Grade 4.

GEORG EGGELING, Op. 247



※ From here go back to *Trio* and play to *Fine of Trio*, then go back to the beginning and play to *Fine*.

Many Nestle "LANOIL" Home Outfit Users Personally Thank the Nestle Company, and Mr. Nestle, Original Inventor of Permanent Hair Waving

They Curled Their Hair At Home Permanently With This Dainty Invention, And Write, "It Came Up to Expectations"

"The Home Outfit Is Simple To Use—and The Waving Is Quick, Safe and Comfortable."

"Waving my hair was interesting," — Miss Adeline Lipman, 3124 State St., Milwaukee, Wis.

"I now enjoy all the convenience of naturally curly hair," Miss Dale Martin, 125 S. 14th St., Quincy, Ill.

'The Outfit lasts a 'ifetime and will vave as many heads is you desire."

"It is GOOD to have aturally fluffy hair at ast," Mrs. Sophia Rabowski, 105 First St., Solvay, N. Y.

"My LANOIL Wave improved my personal appearance 100%." Mrs. G. T. Alcott, Main St., Platteville, Wis.

"I used to dread rainy weather, but no more!" Miss Frances Mrovka, 327 Park Avenue, Collinsville, Ill.

"I have waved myself, and several others successfully," Mrs. H. E. Herbert, Green Cove Springs, Fla.

"My wave has been in three months," Miss Marion Blakeley, 5869 W. Lafayette Ave., Detroit, Mich.

"A most wonderful invention," Mrs. Robert M. Eby, 4316 Barker Ave., Omaha, Neb.

"My hair curling troubles are over," Miss Dorothy Carlson, 33 Woodcrest Ave., Dayton, Ohio.

THERE is nothing that women and girls appreciate more than a useful invention which adds to their daily comfort and beauty. But we doubt if ever any other invention aroused such spontaneous approval in thousands of American women, as has the Nestle LANOIL Home Outfit.

For *this* invention gives freedom to slaves. No other term describes her who is compelled to sleep in curlers every night, or to use hot irons daily. Nor can other terms describe the mother who has to curl her children's hair daily.

"What a relief Mr. Nestle has brought me," they write. "I have not had a curler in my hair since I used your marvelous Outfit."

"It does the most wonderful thing on earth," others tell us. "Every straight-haired woman should hear about it."

And they are *right*. Every woman *should* know of the Nestle invention. No other form of hair curling, whether by nightly curlers, fluids or hot irons can possibly approach the results of the Nestle PERMANENT wave by the LANOIL Process. A single waving gives you permanently curly hair. And so simple and foolproof is the Home Outfit that children can handle it.

On 30 Days' Trial Free

Send for your Outfit with free trial supplies today, and if you are not satisfied with the results, return the Outfit, and every cent of its $15 cost, deposited with us or with your postman will be refunded to you immediately. Just imagine your hair, naturally curly. Imagine how free you will feel when your hair looks pretty ALL THE TIME, and rain, bathing, perspiration and shampoos only make it look prettier.

The coupon below, or a letter or postal will bring you either our illustrated free booklet on the Nestle LANOIL Home Outfit, or better still the Home Outfit itself on this liberal free trial basis.

If you have any doubt as to the Nestle Company's responsibility, write to this magazine, or to the Harriman National Bank, or the Equitable Trust Company of New York City. Nestle's have been established in Berlin, Paris and London since 1905, and since 1915 in New York, where in their two establishments, each day several hundred prominent women of fashion and the stage get their Nestle LANOIL Permanent Waves.

You have every assurance that you will either get satisfactory, naturally curly hair, or your money back promptly, and without question, so send for your Home Outfit today.

NESTLE LANOIL CO., LTD., Dept.

The Singer's Etude

Edited for May by
GEORGE CHADWICK STOCK

It is the Ambition of THE ETUDE to Make This Voice Department
"A Vocalist's Magazine Complete in Itself"

Tone-Talks

DEAR SIR: "What are the first really essential things for a student of singing to know in order to make satisfactory headway? I have tried a number of different methods, including those calling for knowledge of the sciences of anatomy, physiology, psychology, and physics. So many things have been told me about throat and diaphragm and the locating of tone that I am pretty badly mixed as to what is the exactly correct thing to do.

"Please inform me if it is true that a vocal student must have a scientific knowledge of the different parts of the vocal instrument and their action in singing. Originally, I sang at least easily and without thinking of my breath, which seemed to work all right. I have lost this ability.

"Why is it that men and women who teach the voice differ so radically in their methods of instruction? Is there not some common ground upon which all could agree?"

Signed: "One who wishes to know the correct way to sing."

Three Beginning Features of Vocal Culture

A beginner should first gain a clear idea of three things: A beautiful quality of tone, correct tone production, and proper breathing. These are the major forces that must work perfectly together and be spontaneously employed in artistic singing. To achieve this, the alpha and omega of voice culture, the beginner must use the method that rests solidly on the foundation of nature, common sense and art.

Mystifying Vocal Methods

Your letter points to methods of voice training that may be understood by scientists and the makers of methods, but which invariably mystify the singer more than they enlighten him. For the edification of the uninitiated a brief list of talked-about vocal methods follows: "The secret of success lies in the hyo-glossus." "Foundation of true tone—the grooved tongue." "Vocal control hinges upon knowledge of physiological action." "Eat for voice." "The diaphragm is the mainspring of song." "Natural tone production." "New method of natural tone production." "Entirely new method of natural tone production." The titles are unique, but there are scores of other vocal methods whose names are even more curious. Is it any wonder that vocal students get confused, and that many, becoming discouraged, give up trying to learn to sing?

Good Points of Vocal Methods Often Buried in Obscurity

Just a few words about vocal methods. However strange and fantastic some of their names and however queer the things to be done, there is always an element of truth and some degree of help to be extracted from each. *But* the truth and the help are often so hidden in a maze of incomprehensible statements and weird muscular performances that they are rarely discovered by the student. Flitting visitations of real vocal information do little good. The student of song must have the unalloyed truth clearly presented at each lesson, in order to be practically benefited.

Mechanical ways of breathing and science in vocal tone production involve attempts to control consciously the action and formation of different parts of the vocal instrument. All parts, inclusive of the breathing, when functioning properly, do so with as much freedom from conscious interference as the heart, liver, lungs, or digestive organs.

Scientific or mechanical ways of learning to sing never accomplish what they set out to do. They invariably lead to disaster, never to song that is spontaneous and thoroughly artistic.

Smooth Voice Progress Preferable to Vocal Floundering

Why plod and stumble through indistinct paths of vocal ambiguity when there is a plain highway to correct breathing and tone production? In other words, the singing of a spontaneous musical tone and correct breathing is a simple, not a complicated, matter, and can be practically demonstrated by the teacher and acquired by the pupil in a very short time.

Mind you! I do not say that a novice can be transformed into an artist in a brief space of time. But I do know that a beginner's feet can be placed at once and firmly on the correct path that leads to fine artistry in song. A little farther on in this Tone-Talk concise instructions will be given on how to produce in a comparatively short time correct musical tone and breathing.

Scientific Voice Culture Versus the Natural Methods of the Old Masters

Scientific voice culture has confused singers for the past seventy-five or one hundred years. Previous to this the method of training voices was based on the natural development of beautiful tone.

The attentive listening ear of the master, unaided by scientific knowledge and without attention to what the muscles were doing, managed by tone illustrations to get his pupils to sing correctly. And guided by empirical judgments these wise old teachers could unerringly determine whether the voice was correctly produced, and also if the tone measured up to a high standard of beauty, smoothness, resonance and timbre.

Another thing, the old masters always taught in classes of four or five, and so pupils had the great advantage of hearing each other with the additional help of the instructor's wider and more varied comment and criticism.

Some of the World's Finest Singers Have Been Taught Empirically

As fine singers as the world has ever known and the most beautiful quality of tone have been and are being developed without the aid of science, mechanical means, or endeavor consciously to control breathing or any of the parts of the vocal mechanism.

We are slowly coming back to the more simple and direct way of training voices employed by the earlier masters; and to-day, in America, there is an ever increasing number of teachers who are leaning more and more heavily on nature and common sense and decreasingly on science and mechanical thought and devices.

The Beginning of Scientific Voice Teaching

When Manual Garcia, the famous singing teacher who died A. D. 1900, in London, at the age of over one hundred years, invented the laryngoscope (a tiny mirror fastened at the end of a short stick, which, thrust down the throat of a singer, shows the vocal chords in action) he gave to throat specialists a very useful instrument for throat diagnosis, but a useless one in the hands of a singer.

It was about the time of the appearance of the laryngoscope that science and various mechanical devices began to creep into the art of singing, and, ever since, it has been unintentionally busy destroying the soul of song.

Mechanical Thought Prevents Inspired Utterance in Song

I know from personal experience and varied observation among teachers and singers in all parts of the country that the most intimate and scientific knowledge of vocal chord action of the movements of any other part of the vocal instrument is of no real help; on the contrary, it is a drawback. I have always found that the more a singer thinks of the various muscular processes involved in singing, the less able he is to produce real song.

The Essential Thing for the Student to First Know

The essential thing to acquire in the beginning of vocal study and, mind you, the easiest and most direct—is a free, spontaneous musical tone that yields as lightly as a feather to the touch of a breath. This is to become the constant working principle and guide in all singing. With it the singer develops skill in technic and in gaining volume and full powers of expression in song.

For the purpose of accumulating diversified information, no harm can come to a teacher of singing if he reads up on anatomy, physiology, physics, and psychology. He may even enter into the field of study and experiment connected with these sciences, particularly psychology. Such extended information may prove helpful; that depends largely on how clear his views become on the relation of sciences to voice, song and individuals.

But if a teacher's knowledge of these sciences—irrelevant as applied to singing—is of a cursory nature, it will do more harm than good to bring it into the training of voices. It would be far better for a teacher to drop out of his voice instructions smattering allusions to anatomy, physiology, and kindred matters; if he is in the least degree confused in his own mind regarding their application and function in tone production. A shoemaker makes a better shoe by sticking to his last. A singing teacher will make a better singer of his pupil if he sticks to fundamental principles of breathing and tone production that truly belong to the art of singing.

Smattering Illusions to Sciences Confuse a Pupil

We all know that any of the several sciences that have been named require the work and research of a life time to master them. How then can a voice instructor expect to employ to advantage in his teaching, superficial references to sciences that are of profound significance in relation to human life, but have no bearing upon the study of song? Is it any wonder that a young singer listens with hopeless mental confusion to vocal instructions that bristle with meaningless words, terms and statements, quite often as little understood by the teacher as by the pupil? It is no more true that a beginner in voice study must have a scientific knowledge of his vocal instrument than that a young piano pupil must have such knowledge regarding the construction of the piano.

Actual Singing Practice Infinitely More Valuable to the Student than Scientific Discourse

A few moments spent in singing simple sweet tones is of more real value to a vocal student than all the glittering scientific generalities ever invented. As moments of such correct singing grow into hours of similar practice, the more perfectly the voice is developed as a musical instrument capable of perfect expression in song.

A Few Practical Instructions for Vocal Students

Supposing you reflect upon the following ideas: In correct singing or speaking the entire vocal mechanism, inclusive of the breathing apparatus, the lungs, acts as a complete whole. In other words, there is instinctively carried on a perfect working together or co-ordinate movement of all parts of the vocal instrument. Make this idea practical by trying the following plan. Speak the work "on" with utmost naturalness. Instantly every part of the vocal and breathing mechanism springs into unified automatic action. Next, sing the word "on" on the pitch of middle C with the same naturalness and ease as you have just spoken it. Do not vary a hair's breadth—so far as physical action is concerned—from the way you spoke the word "on." The only difference is that the conversational quality of the spoken word has changed in a subtle way into a musical tone.

In the above simple practice you will find an unerring guide to a perfectly natural singing tone. This is the first really essential thing for a beginning pupil of the voice to know and practice. It requires but little breath and that perfectly natural. Therefore, for a while nothing need be said about breathing. This is the first tone practice necessary, and is the beginning of the vocal foundation upon which correct artistic use of the voice rests.

Every additional tone placed on this foundation must be closely and critically examined by the ear of both teacher and pupil. If it conforms to the ideal standard of tone quality set up, place it in the foundation that is being laid. If it does not conform to the quality desired, try again.

As the superstructure of technic, color ornamentation and expressional embellishments reaches higher levels, be sure to watch every additional step taken. Let there be no departure from an ideal conception of beautiful tone, produced with never a consciousness of tonal or breathing processes.

The Heart of the Whole Matter

What has been suggested to you to think upon and accomplish requires concentration, sincere enthusiasm and constant play of imagination; and do not forget always to look to the inspiring aid of the spirit. Be thus guided every time you sing and always abandon yourself to the finest things within you, whether your work be scales, vocalises or song.

In the interpretation of a song make its message your own. Having a clear vision and living realization of it, sing as you feel and into your voice will come a convincing power reaching all hearts.

"THE young student should keep interested in everything. Art gets narrow if you think only of that. Keep eyes and ears open; keep the soul always ready for something to happen."—GALLI-CURCI.

The Voices of Young Girls Should Be Under Careful Training

I KNOW from an experience of many years in training the voices of young girls of from twelve to fourteen years that, given talent and desire to learn to sing, they should be under skilled guidance.

Voice culture at the age of twelve, thirteen, or fourteen years involves simply a proper exercising of the voice with a slight musical quality of tone, produced in the most natural manner. Any attempt to force the range or to sing a mature or older tone is wrong.

When a voice is naturally of good quality at this early age, and a girl, untaught, is able to sing simple songs sweetly and unaffectedly, the proper procedure, in developing such a voice, is to guide and direct it in accordance with the natural conditions of tone production and breathing as they are found. Rarely will these conditions be far out of the way of correct use. I am speaking, remember, of talented girls with good voices. Should there happen to be some minor faults of singing, breathing or of producing tone, the better plan to follow in correcting them is to give simple illustrations of correct singing, tone production and breathing. Never enter into confusing details relative to tone-placing, head or chest resonance, various ways of reinforcing tone, nor try to explain diaphragmatic, abdominal and intercostal breathing. The mind of young singers should not be filled with a lot of obscure and too often valueless methods and notions about tone production and breath control.

A good many of the "methods" on sale in the vocal market, we fear, mar more voices than they make. Keep them away from the singer of inexperience and immature years.

In the training of young girl singers, however good or strong the voices may be, bear in mind that in these early years, to fifteen, or even several years older, full physical growth and strength have not been reached. Therefore in every case, whether the voice is weak or strong, the vocal work done should never be of a kind to overtax the immature and delicate vocal organs. All singing practice should be within a range limited to tones that can be sung with ease, naturalness and without the slightest strain or forcing.

Young girls should never be allowed to sing loud or extremely high. Songs should be given them, but they must be suitable in range and style, and always sensible and wholesome in text. Songs of a trashy type should be crossed off the list. Eventually songs of a frivolous kind become distasteful to all who become fond of good songs.

Frequent Lessons Unnecessary

In beginning the training of young girls' voices it is advantageous and practical to give less frequent lessons than to older pupils. One lesson every two weeks in many cases will answer. This suffices usually because the situation calls for careful and intelligent oversight respecting the simple plan of procedure, rather than for the close application and practice necessary in later years.

For young girls suitable songs furnish the most valuable practice material. In them will be found a great variety of exercises for the voice and opportunity for the development of intelligible pronunciation. Furthermore, the expressional powers begin their development when the imagination is fully alive and the perception is keenest. Hence the singer who thus begins training in youth rarely loses that freshness, naturalness and spontaneity of spirit which is the chief charm of song.

No Valid Reason Why Voices of Young Girls Should Not Be Trained

People who advise against early vocal training for young girls mean well, but they are rarely sufficiently informed in vocal matters. Usually they are moved to discourage vocal lessons for the young because it is a tradition of many generations; and so the common opinion is not in favor of vocal study until eighteen years or so have been passed. Those who are better informed know that the throat of a young singer should be looked after as carefully as the fingers of a young pianist. Some of the greatest prima donnas began their training when mere children. There is nothing finer to bring into a child's life than song; but make sure that it is *song* and not vocal drudgery.

However vocally talented a young girl may be, she should not be crowded but should be encouraged to carry on a well-balanced child-life with all its healthy outdoor-life and play. Other subjects in school must have due attention. Therefore in order that there shall be all-round development, concentrated grinding in any one subject should be avoided.

If a girl loves singing, encourage her in it in every way possible. Nothing that she can do will do so much to build up the strength and health of her entire physical and spiritual life as will song.

Daily Reminders For a Vocal Student

Do not lose sight of three principal things in all practice: A beautiful quality of tone, spontaneous tone production, and breathing that is in accord with natural respiration.

The voice is not made of lifeless material like other musical instruments. It is a thing of life, subject to changes of health, and so not always in condition to be played upon. It is poor judgment to sing with a sick throat. Let it alone until well.

Tone is best when the throat and the singer are in perfect health.

When your voice is not in its best form remember to practice with especial care. If, after ten or fifteen minutes of judicious singing, your voice fails to respond satisfactorily, give it a rest.

It is wrong to sing or practice with a throat cold or the slightest laryngeal trouble.

Your lessons will be worth just what you can put of them into correct practice.

When your teacher tells you something that you do not thoroughly understand, stop right there and find out exactly what he means.

Begin your first practice of the day with easy tones in the comfortable range of the voice. Gradually the work can proceed to fuller and higher tones.

Forcing or straining for tones is wrong and unnecessary in any part of the scale. Undue effort to get tones mars their musical quality and prevents fullest expression of the emotions. Many who sing with rigid throats have become so accustomed to it that the tightness or undue tension is not noticed. While such singers sometimes sing fairly well, they would do much better if they sang with throats free of the slightest rigidity.

Avoid tongue gymnastics. They may be good for an ant-eater, but they're mighty bad things for a singer.

Be sure that you know a song; that you feel its message. Such knowing is back of all true song interpretation.

Do not forget your breathing exercises. They increase lung capacity and give strength and quickness of action to the breathing muscles.

Complete breathing control is gained through all kinds of use of the voice in

IVERS & POND
PIANOS

Over 500 Musical Directors Have Selected

THE IVERS & POND

When acquiring precious jewels, valuable paintings, rare objets d'art, expert advice is highly prized and eagerly sought.

In the realm of musical art, and of the piano, its fascinating exponent—there exists a class of experts—the college musical directors—who must, by results, prove the faith that is in them.

Upon these teachers of this art of universal appeal, falls the responsibility of selecting pianos for the departments over which they preside. Their training qualifies them as musical experts, to judge tone action and construction. Their choice must rest upon the piano best embodying their requirements, and vindicating over the years their judgment as experts.

Under such conditions 500 educational institutions are now using the Ivers & Pond—one, the far-famed New England Conservatory, having bought more than three hundred Ivers & Pond Pianos. The purchase of expensive jewels is often made on a single expert's action; should not the combined opinion of half a thousand leading music instructors inspire confidence in the minds of piano buyers?

Our Unique Selling Plan

If we have no dealer near you, we can supply you from our factory as safely and as satisfactorily as if you lived near by. We make expert selection and guarantee the piano to please, or it returns at our expense for freight. Liberal allowance for old pianos in exchange. Attractive easy payment plans. For catalogue, price and full information *write us today.*

Ivers & Pond Piano Co.
141 Boylston Street Boston, Mass.

Protect that cavity!

Guard against further decay. Stop the ache. Treat cavity regularly with Dent's Toothache Gum. It does four things for bad teeth.

"A Swell Affair"

DENT'S
TOOTHACHE GUM
1. Stops toothache instantly.
2. Cleanses & protects cavity.
3. Retards further decay.
4. Destroys all odor.

Contains no creosote or harmful ingredients. Does not spill or dry up like liquids. At all druggists' 25c, or by mail upon receipt of price. Made for 35 years by C. S. Dent & Co., Detroit.

New Methods in Child Training

Now for the first time there is a scientific method in child training, founded on the principle that confidence is the basis of control. This new system shows you how in your own home to correct the cause of disobedience, wilfulness, untruthfulness and other dangerous habits which, if not properly remedied, lead to dire consequences. The trouble in most cases now is that children are punished or scolded for what they do. The new method removes the cause—*not* by punishment or scolding but by confidence and cooperation along lines which are amazingly easy for any parent to instantly apply.

Highest Endorsements This new system, which has been put into the form of an illustrated Course prepared especially for the busy parent, is producing remarkable and immediate results for the thousands of parents in all parts of the world. It is also endorsed by leading educators. It covers all ages from cradle to eighteen years.

Free Book "New Methods in Child Training" is the title of a startling book which describes this new system and outlines the work of the Parents Association. Send letter or postal today and the book will be sent free—but do it now as this announcement may never appear here again.

The Parents Association
Dept. 1245, Pleasant Hill, O.

singing. The first step towards this control is taken with the first tone sung.

Technic is the brain of song, expression the soul. In singing that succeeds the latter rules, the former serves.

Try always to pronounce words distinctly, not only because intelligible speech in song is highly desirable, but also for the very practical reason that clear enunciation helps greatly to get the meaning of words into tone.

Do not fail to question your teacher frequently. It gives him a chance to see what is running through your mind and so makes his instructions more valuable because more applicable.

Observe closely how good singers interpret songs; but do not copy what they do to the extent of hindering the development of your own individuality. There is little of personal touch in a song that is not filled with the personal note.

When you sing, whether at practice or song, stand erect and at ease. Such is to be your posture whenever you are singing; so be sure that the work you do in private is in accord with what you wish to do in public.

Avoid breathing exercises that compel you to lie flat or to lean over the back of a chair or push with the diaphragm. Another breathing exercise that is useless and positively dangerous in some cases is the one of taking in several breaths, one on top of the other, until you feel ready to burst. In such a condition you are unfit for singing. The breath to be inhaled is determined by the tone or tones or length of phrase to be sung. The fullest inhalation ever taken in correct breathing and singing should never make a singer feel uncomfortable or overloaded with breath.

The Training of Women's Voices

1. The principles of tone production employed in training voices are the same for both men and women. The common aim should be to attain spontaneous free-flowing tone of the finest attainable musical quality.

2. In training women's voices a teacher should always consider the more delicate physical build of the vocal organs. The larynx is not to large as a man's and the vocal cords are smaller and of finer texture. The tone used and the breath pressure employed should be in accord with this slighter built vocal instrument.

3. The vocal cords of a man are thicker and longer and so yield a fuller and more deeply resonant tone, and they can stand heavier work. A woman's voice may be compared to a violin and a man's to a 'cello and bass viol. The strings of the violin are light and those of the 'cello and bass viol are long and heavy. It would rack the strings of a violin to play upon them with the bow of a bass viol. And it would be disastrous to put upon a woman's throat the work that a man's throat can stand.

4. Women students of song are apt to stray from foundation vocal work in the beginning of study. They crave for the aesthetic element in song and sometimes forget the importance of fundamentals.

5. Women vocalists have a strong predilection for singing the extreme high notes. The ambition to hit high C becomes almost a mania with some. Unfortunately singers are too often encouraged in this hazardous aim.

6. High C's break down more fine voices than they build up. It takes years of the most careful training to sing properly big tones so that they will not cause unfavorable reaction upon the vocal organs. The most expressive and most beautiful part of the voice is from middle C to F on the fifth line. Make sure the proper development of these tones and a safe foundation will have been laid for the tones higher up.

7. In relation to breathing exercises for girl students, not one single exercise should tire or cause them physical discomfort. If any breathing exercise is of a kind to cause the slightest distress, pain or back-ache, it is absolutely wrong; nay, more, it is injurious. Furthermore all breathing exercises should be carried on in a standing position as when singing is done. Both men and women students are frequently made to exercise their breathing muscles and take various positions in extraordinary and totally ridiculous ways. Nothing but harm comes to such measures. Stand up when you breathe, and follow the laws of natural respiration. No man living has ever invented a better plan.

8. There are differences in the masculine and feminine way of thinking things out that should be taken into consideration. Songs should never be given to women singers that are unsuitable to their tastes, feelings and inclinations.

9. Generally, women give to songs a finer touch, finer quality of tone and endue them with more delicate treatment and spiritual grace than men because—well because they are of the feminine sex, than which at its best, there is nothing more lovely, more refined or more wholesome in human life.

Musical Misinformation

By Blanche Stannard

The versatility of newspaper reporters is common knowledge; but sometimes their reports on musical affairs contain ludicrous statements.

In "The Foolish Lovers," the chief character is sent on his first assignment to report a concert.

"But," he objects, "I have no ear for music. I hardly know a minim from a semi-quaver!"

"Well, that doesn't matter," is the reply. "Get a program. Mark on it the songs and pieces that get the most applause. Those are the best things. See? Anybody can criticise music when he knows a tip or two like that. If the singer is a celebrated person, like Melba or Tetrazzini, you say she was in her usual brilliant form....."

Later in the story a friend tries to induce the hero to write his criticism in a tea-room without even attending the concert!

Doubtless many reports in American newspapers containing musical references are written in tea-rooms, or the equivalent and by writers who know more about batting averages than about "semi-quavers."

Certainly the one who reported that the local movie orchestra "gave a pleasing rendition of 'Olive Tell' overture" knew less about overtures than he did about the screen.

RICHARD STRAUSS

FLORENCE EASTON

As a means of contributing to the development of interest in opera, for many years Mr. James Francis Cooke, editor of "The Etude," has prepared, gratuitously, program notes for the production given in Philadelphia by The Metropolitan Opera Company of New York. These have been reprinted extensively in programs and periodicals at home and abroad. Believing that our readers may have a desire to be refreshed or informed upon certain aspects of the popular grand operas, these historical and interpretative notes on several of them will be reproduced in "The Etude." The opera stories have been written by Edward Ellsworth Hipsher, assistant editor.

"Der Rosenkavalier"

WHEN Richard Wagner gave the first presentations of "Die Meistersinger," "Tristan" and "Parsifal," he was content to have the solos on French horn, very important details in these scores, played by one man only. That man was an ardent enemy of Wagner, Franz Strauss, solo hornist at the Hofoper in Munich. Franz Strauss died in 1905, famous in his *Fach*, but now known almost solely as the father of the foremost composer of the time, Richard Strauss. Richard Strauss was thus saturated from his childhood in operatic atmosphere. In 1905, Strauss produced an opera which brought him immediate operatic fame, "Salome." Although Strauss had previously written two works for the stage ("Guntram," produced at Weimar, May 10, 1894, and "Feuersnot" ["Fire Famine"] produced at Dresden, in 1901), he was chiefly known for his symphonic poems which had attracted international attention, in which he developed a form of orchestral canvas of even larger and richer character than the symphonic poems of Franz Liszt.

The intense treatment which the composer devoted to "Salome," and also to the epic "Elektra," produced in Dresden in 1909, inclined the critics to look upon the Straussian muse as purely tragic. Sombre colors mixed with barbaric cacophony as well as sensuous melodies all limned with the broadest strokes, and the genius of a great orchestral master commanded the widest attention from music lovers.

With the production of "Der Rosenkavalier" ("The Knight of the Rose") which Strauss wrote to the dramatic poem of Hugo von Hofmannsthal (author of "Elektra"), Strauss amazed the musical world with a work which some described as Mozartian in the loveliness of its lighter touches, but which is really a highly individual work probably destined to be heard more than any of the Strauss works for the stage. The opera was done for the first time in Dresden, in 1911. It reached America in January, 1913, at the Metropolitan Opera House, when Hempel took the leading rôle as *Princess Werdenberg*.

"Der Rosenkavalier" is known as a "comedy for music." The libretto even in its softened form is very broad, but to censor the morals of opera libretti would be tantamount to exterminating the art. The orchestral score is huge in its demands—114 instruments being called for. The waltz themes are often represented as having the simplicity of the famous tunes of Johann Strauss. Johann Strauss, however, would doubtless have jumped out of his skin if he had ever heard his favorite dance form as glorified by his namesake. Richard Strauss seems to have the gift of bringing forward a haunting melody, only to lose it in his contrapuntal veil in a manner which must be very tantalizing to the man who attends opera with the hope that he may develop his talent for whistling the themes on the following day. H. E. Krehbiel goes so far as to make the comment upon this that "Unfortunately the Straussian system of composition demands that beauty be looked for in fragments." However, if the proof of the pudding is really the appetite of a healthy box office, there is no question that the public likes "Der Rosenkavalier." It makes a fascinating rococo picture, and, with the orchestral barrage provided by the composer, the most innocent auditor is safely protected from any of the reputed vulgarities of the lines.

Story of "Der Rosenkavalier"

Act I. Princess Werdenberg's Palace. During the absence of her husband, a Field Marshal of Maria Theresa, the *Princess* indulges in a flirtation with young *Octavian*. Footsteps are heard, and fearing the Field Marshal's return, *Octavian* hastily dons a maid servant's apparel. Instead of the *Prince, Baron Ochs* enters to tell the *Princess* his intentions to wed *Sophie*, daughter of *Faninal*, a rich army contractor. In the custom of the times, he asks the *Princess* to select the traditional rose-knight to ply his suit. *Ochs* boasts of his conquests and blandly mentions that he will wed *Sophie* only for her money. The *Princess* asks him to luncheon, which is served by *Octavian* disguised as a waitress, and with whom the flirting *Baron* arranges a meeting. The offended *Princess*, as punishment, suggests as a rose-knight her young friend *Octavian*.

Act II. Faninal's House. *Sophie* awaits the rose-knight. *Octavian* enters with the rose, but to press his own suit rather than that of the *Baron*. In spite of her father's mandates, *Sophie* is unresponsive. She retires; the *Baron* reproaches *Octavian;* and in the ensuing duel the *Baron* is wounded.

Act III. A Tavern. *Octavian*, in the guise of a maid-servant, flirts with the *Baron* without being recognized. The *Guardian of Public Morals* enters, bribed to frighten the *Baron*, whom he charges with attempting to mislead the *Princess'* maid. The *Baron* asserts the maid is his fiancée, *Sophie;* but *Octavian* reveals his male attire under his skirts and announces the betrothal of himself and *Sophie* who now enters with the *Princess, Faninal* and others. The *Baron* flees in mortification; while the *Princess* gracefully resigns her young lover to the happy *Sophie*.

YOUNG FOLKS' OPERA GEMS FOR THE PIANOFORTE. Price, 75c
An exceptionally interesting album for young pianists. Contains 27 second and third-grade arrangements of opera melodies. 17 composers and 23 operas are represented.
THEO. PRESSER CO. 1712 Chestnut Street Philadelphia, Pa.

The
Premier Aristocrat Model
PRICE $725
The 5 foot 3 inch Aristocrat Model is all that its name signifies.
In tone, action and typical Grand Piano appearance it demonstrates superior quality.
First choice of studios, conservatories, public institutions and discriminating lovers of music because of its combination of inherent piano value *at an unusually attractive price.*

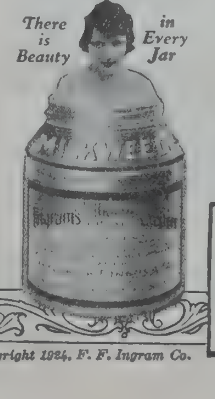
This Fascinating Test Reveals Beauty's Only Secret
Ten Minutes Will Show You, Too, The Only Sure Way to Beauty
So that you can easily understand how to gain and preserve a clear, attractive complexion, Mr. Ingram has devised this interesting, educational test you can make in your own boudoir.
In no other way can you learn so quickly and convincingly, the real secret of a beautiful skin. In addition to clearly showing you the causes of complexion faults, the Dermascope will show you *how* and *why* Ingram's Milkweed Cream, unlike any other, destroys these almost invisible dangers and builds the firm, clear, youthful skin that you should have.
The One Cream Perfect for Every Use
Ingram's Milkweed Cream, used over thirty years, is a real beauty cream and the only one you need use to develop and keep a clear, soft, smooth skin. It is heavy enough to be a thorough cleanser and yet light enough in body to form a comfortable and effective protection and foundation for powder. But it has an exclusive feature—certain *remedial* properties that relieve redness, roughness, tan, blotches and slight imperfections. *No other cream is like it.*
Buy a jar today and see the immediate improvement it brings. $1.00 and 50c jars at all drug and department stores—the dollar size contains three times the quantity.
Windsor, Ontario, Canada Frederick F. Ingram Co. 143 Tenth Street, Detroit, Mich.
Established 1885
Ingram's Milkweed Cream



Ingram's American Blush Rouge
Applies so evenly and smoothly, its effect can only be a natural, healthy glow. It does not clog the pores and because its coloring matter cannot be absorbed it is recommended particularly for a delicate and sensitive skin. In thin metal vanity box with mirror and pad—50c. At your dealer's or by mail from us. Next time be careful to get ***Ingram's American Blush, the Delicate Rouge for the Delicate Skin.***
Send for this interesting test today
Mail coupon below with 15 cents for new Beauty Purse containing Ingram's Dermascope; a liberal sample of Ingram's Milkweed Cream; two filled purse puffs of Ingram's Face Powder and Rouge; instructions for using Dermascope, and valuable hints for the care of the skin.
F. F. INGRAM CO., 143 Tenth Street, Detroit, Mich.
Gentlemen: Enclosed find fifteen cents. Please send me Ingram's Beauty Purse including Dermascope described above. Please print name.

The Organist's Etude

It is the Ambition of THE ETUDE to make this Organ Department "An Organist's Magazine Complete in Itself"

Edited by Well-Known Specialists

The Organ in Oratorio

(The Position of the Organ in connection with the performance of oratorio has been very ably traced by H. Heathcote Statham, in his very excellent book, "The Organ," from which the following extracts have been made. For many years the lovers of oratorio sought an orchestral accompaniment for the great masterpieces, largely because oratorio was heard so very frequently under purely churchly auspices that there was fear that it might lose its popular appeal to those rarely attending church. This is regrettable as the combination of a great chorus, a great organ and a great orchestra is not merely overwhelming in its power but so rich in color possibilities that it is delightful to see the organ returning to its rightful place in American oratorio performances. The large organs in some movie houses have already been used for the purpose with notable effect. New organs are being built in all parts of the country.—EDITOR OF THE ETUDE.)

THE part which the organ should take as an accompaniment to the chorus and band in oratorios and cantatas is a question of some interest, in regard to which there seems to be no fixed principle or practice. Except in a very few modern works, composers of oratorios have written no special part for the organ, so that its introduction is mostly left to the *ad libitum* ideas of the organist. I can remember that in my youth the received idea was that the organ was to be played through all the choruses in an oratorio, not in a very prominent manner, but so as to form a kind of solid background of tone holding the chorus together. This was, I believe, a purely English tradition. In that clever, though too exuberant, musical novel, "Charles Auchester," written some half a century ago, but which still (and not undeservedly) keeps its place to some extent in fiction, a great deal of ridicule is thrown on this English idea of being unable to have an oratorio without an organ background, and it is represented as a piece of musical philistinism of which the better land of Germany was incapable. Considering that Mendelssohn (under another name) is made the hero of the novel, and is represented as participating in this scorn of the English practice, it is rather amusing that as a fact (as the author of the novel evidently did not know) Mendelssohn was the first modern composer to become alive to the importance of the part which the organ might play in oratorio, and not only furnished special instructions for its introduction in his own two principal oratorios, but actually wrote out a special organ part for "Israel in Egypt." At the present time the function of the organist in oratorios, in this country, seems to consist principally in sitting there and looking at the keyboard without being allowed to touch it, except for the purpose of making as much noise as possible at the end of the last chorus of each part. Of the two, the old practice of playing right through the choruses seems on the whole the least fatuous. The organ on that method at least contributed something to the general effect; on the modern method it contributes nothing, except exactly in the wrong way. But there is a better way than either, if people could only be got to adopt it.

Hearing the Effect

The organ, in accompanying oratorio, should be regarded as a power to be used for adding to the effect in passages which present some special need and suitability for the addition of its grave and heavy tones, not merely for producing more noise without reason or artistic motive. In the case of fugued choruses in the strict style the old-fashioned method of playing all through has its merits, and may be employed with good result; it steadies and binds together the chorus-singing. Only in that case the organ should not be played so loud as to assert itself above the band and chorus; the effect of the organ should be heard rather than the organ itself. And the Pedal reeds especially should not be employed; they are too loud and pronounced in their tones, are heard through chorus and band, and destroy the balance of sound; their function, when used, is an entirely different one, which we will return to just now. Such choruses, for instance, as *And with his stripes* and *Amen*, in "Messiah," may well be accompanied in this way with improvement to the general effect; in the latter chorus the organ to be silent during the two short instrumental symphonies. At the last page of the *Amen*, some increase of power may be allowed, always taking care that it is not loud enough to drown or obscure the tone of voices and strings; and a Pedal reed may be added on the dominant Pedal before the close, to give more weight and continuity to this long holding-note than the string basses can give. But all this use of the organ throughout a fugued chorus should be with moderate power only—not more than Full to Fifteenth; and often Diapasons and Principal will be quite sufficient.

This is a point to be the more borne in mind in consideration of the immense size and power of many of the modern organs to be found in large concert-halls, which renders them very dangerous implements in the hands of organists of more zeal than discretion. I have heard the final chorus of one of Handel's oratorios completely ruined by the blaring sounds of a huge organ played *fortissimo* all through the movement, so that practically one heard nothing but the organ. The misfortune is that the conductor is often not fully aware of this, for, having the sounds of the band and chorus close to him, while the organ is at a greater distance, he hears the voices and the violins plainly enough; but it is another matter to the listener in the body of the hall, as I can testify from painful experience.

Using the Organ to Intensify

But in choruses of another class than strict fugues—choruses of a dramatic character—the organ may play quite a different function from merely filling in the body of tone; it may be used to give a special effect and coloring to special passages. For instance, in the chorus *Envy, eldest born of Hell*, in *Saul*, in the main part of the chorus, with its detached phrases and ejaculations for the voices and scale passages for the strings, the organ has no suitable place; its function is to add its grave and heavy tones at the passage of slow harmonies at the words *Hide thee in the blackest night;* not *fortissimo*—it is *weight* that is wanted here, not noise; 16-ft., 8-ft., and 4-ft. Diapason tone on the manuals, and 32-ft. and 16-ft. on the pedals. Added at this point, with the fullest chords possible, the organ immensely intensifies the gloomy grandeur of this episode in the chorus. Among other instances in which the addition of the organ tone would give a special meaning and effect to a special passage may be mentioned two or three choruses in "Messiah." One is in the chorus *And he shall purify*, the main portion of which is in a rather free contrapuntal style, with rapid passages of "coloratura" for the different voices, in which the organ would be rather in the way; but this is interrupted from time to time by a passage in massed harmony for the voices, at each recurrence of the words *That they may offer unto the Lord an offering in righteousness.*

The organ should be reserved for those passages, which would gain immensely in effect by the weight and solemnity which its introduction would give to them. Similarly, in the chorus *For unto us* the organ should be reserved to add its weight to the series of ejaculations at the words *Wonderful! Counsellor!* etc. In the beautiful chorus (too often omitted in performance) *But thanks be to God*, which is mostly in a rather light, detached manner of part-writing for the voices, accompanied by a moving bass in the orchestra, there occurs several times a passage in which the sentence closes with the words *Through our Lord Jesus Christ*, in each case with a "full close" in the music. I have often thought that the introduction of the organ (Diapason tone only) at those passages would give to them a special solemnity and church-like expression. For, whether from the grave severity of its tones or from the constant association of the organ with church services (or perhaps for both reasons combined), there is about the organ tone a certain kind of religious character, as contrasted with the tones of the orchestral combinations of instruments.

For this reason, to take examples from another oratorio of Handel, it would be quite suitable, in "Samson," to accompany the chorus *Then round about the starry throne* with the organ throughout—the whole composition is a kind of hymn in a grave and solemn style; but in the Philistine choruses, *Uplift the trumpet's lofty sound* and *Great Dagon hath subdued our foe*, the organ would be quite out of place; it would take the deviltry out of them. For a similar reason, in the chorus *All we like sheep*, in "Messiah," during the main portion of the chorus the organ would be both aesthetically and (so to speak) morally out of place; the point for its introduction is at the closing slow passage, *And the Lord hath laid on him*, which brings the hearer round to the real meaning of the composition; dramatic in the first instance, meditative at the close.

The Elijah

Another point that may be suggested is that where at the close of a chorus there is a return to a passage of grand and massive character which was first heard at the opening, there is a possibility of a grand effect by reserving the organ for the final repetition of the passage. Take, for instance, the chorus in "Elijah," *Be not afraid*. The opening section, with its massed harmonies, seems to invite the accompaniment of the organ; but if the organ were reserved for the return to this passage at the end of the chorus the effect would be immensely increased, providing a climax which would be all the more impressive through being unexpected and coming as a surprise to the hearer. It is the same effect which is produced, as a calculated and prepared result, in Sullivan's "In Memoriam" overture, where the slow movement, first heard at the opening of the composition without the organ, is resumed at the close with the organ added, with a grand and unexpected effect of climax.

There is one negative rule in accompanying oratorio which admits of no exception. Where, as is frequently the case, the chorus is accompanied by figure passages for the strings, independent of the voice parts, the organist should *never* double the violin passages on the organ. To do so is a kind of aesthetic barbarism. The organist is not there for that; he is there to assist, where suitable, in the broad general effect, not to confuse the details of the string accompaniment by doubling them with a tone which is of a totally different nature and *timbre* to theirs. Wind instrument parts may on occasion be doubled on the organ with advantage, where there are any additional effects to be obtained by doing so, but light string passages never.

Reference was made just now to the Pedal reeds, and the inadvisability of lumbering a general chorus accompaniment with them, as they are too heavy and are heard through everything. But, rightly used, they represent a power which is of great value for special effects. As an example, take the first introduction, in the first chorus in "Messiah," of the kind of plain-chant for the basses (which is, in fact, the second Gregorian tone), to the words *For the mouth of the Lord hath spoken it;* that is a point in the chorus which almost asks for the organ to give it character and emphasis, and the introduction of the phrase on the Pedal reeds in octaves would have a grand effect, in a manner perfectly suitable both to the organ and to the character of the music. Yet no one ever seems to think of this. I have inwardly raged, in listening to this chorus at the Handel Festivals, to see the organist sitting looking at the organ and neglecting such an obvious means of adding to the effect of the composition. In a similar way the Solo reeds might be used to strengthen this *canto formo* where it occurs in the tenor and soprano parts.

The neglect to take advantage of the power given by the organ to reinforce a *canto fermo* of this kind, whether it be the fault of the organist or the orders of the conductor (and many conductors seem to hate the organ), can only be called stupid; no less drastic expression is adequate. The same kind of use may be made of the Pedal reeds in certain features of the "Hallelujah Chorus," a composition in which the organ is often much misused. It is quite a common thing to hear the organ begun upon from the first, even with the opening bars of the symphony, as if the great object were to make as much noise as possible. The organ has nothing to do with the symphony, nor with the repeated shouts of *Hallelujah* by the chorus; these are essentially vocal ejaculations, and the organ is essentially non-ejaculatory. The organ should be introduced first, with its full power in this instance, at the unison passage *For the Lord God;* and its subsequent function, in the immediately following section of the chorus, is to sustain and emphasize that *canto fermo*, by Pedal reeds or Solo reeds, in whichever part it appears; also subsequently to assist the trebles in maintaining the successive holding-notes, rising and higher, on the words *King of Kings*. It may then add its weight (not *too* loud) to the passage in full harmony on the same words, and to that on the words *The Kingdoms of our Lord:* and it may very well accompany, *mf*, the ucceeding fugue movement at the words nd *He shall reign.*

After that its function should be rather bring out certain prominent features; e Pedal reeds, for instance, to bring out he subject of *and He shall reign,* where is sung by the basses as the bass of a assage for the whole of the band and horus in harmony; and the Solo reeds, oo, may add power and brilliancy to he unisonal *King of Kings,* on the igh D. But the organ has nothing to do vith the choral ejaculations of *Hallelu-ah,* still less with the decorative accomaniments for the strings; these are dapted for voices and for strings, and hould be left to them. Nor, in any of he more brilliant and jubilant choruses n Handel's oratorios, should the organ ntermeddle in the concluding symphony, vhere there is one. That can only be done as I have heard it done) for the vulgar bject of making more noise at the conlusion of a movement. In choruses of nother class—for instance, at the close f the dirge chorus, *Glorious Hero,* in Samson"—the closing bars for the orchesra might fitly be accompanied very softly y the organ, in order to get in the deep ones of the soft Pedal stops, which add a loomy coloring to the effect; and other nstances of the same kind will readily ccur.

For a similar reason I would have the rgan introduced, for instance, in the slow novement which opens the overture to Messiah," which, however it be modelled n Lulli's overture forms, I have always elt to be of a peculiar solemnity and athos, in keeping with the great subject f the oratorio, and therefore not unuitable to be accompanied on the organ, nly in a subdued manner—Great Diapaons for the first time over, and Choir Dulciana, with the Pedal Bourdon, for the epeat. Orchestral passages of that decription in oratorio may very well be acompanied by the organ, but with brilliant igure passages for the strings the organ hould never interfere.

Greater Solemnity

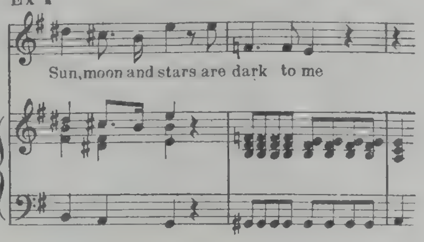
It is not alone in the accompaniments choruses that the organ may be introluced to add to the effect of special passges; there are opportunities of the same ind—to be used, indeed, with caution and eserve—in the accompaniments to solos. Mendelssohn recognized this, for in a copy f "St. Paul" which I have seen he had encilled with his own hand a note for the ntroduction of the organ in the air *Jerusalem,* at the return of the principal subect, which is the most impassioned piece f expression in the air. The introduction of the organ was to give it greater olemnity and emphasis. There is no doubt that Handel often accompanied the solos in his own oratorios on the organ, and filled in thus the thinly written accompaniments, sometimes for the bass only, of the orchestra, and in safe hands this might ften be done with good effect now. Singers, as a rule, do not like this, as they think the organ overweights their voices; but singers are not to be the sole judges in such a matter; according to the old Latin jingle.

Musicorum et cantorum
Magna est distantia.

Some singers are not very good musicians, and are apt to think more of the effect of their own voices than of anything else, and it is hardly tolerable that they are to be allowed (as I have known them claim to do) to prevent an organist, in accompanying Handel's airs, from doing with the organ exactly what Handel himself would probably have done.

As an example of the effect which a single judiciously placed note from the organ may have in aiding the expression of an air, I remember at a performance of "Samson," when Best was at the organ, how at the passage in the air *Total eclipse,* in which "Samson" laments his blindness,

Ex 1



he introduced at the point * two deep notes

Ex. 2

on the pedals,  The organ was not touched in any other part of the accompaniment, but those two notes were invaluable in giving the gloomy coloring to the most grief-stricken phrase in the composition. That is a typical instance of the effect which organ tone, judiciously administered, may have in adding to the expression of a vocal solo. As before observed, it is a thing to be done with great care and reticence; the less it is made a commonplace the more effect it will have in intensifying expression.

Sound Transmission Then and Now

A LEADING English book upon organ construction published very incredulously a report dated 1874, of a huge organ to be constructed in our Middle West, which was to have upon the roof of the building housing it a "diaphone," by means of which under certain atmospheric conditions, the sound of the organ might be transmitted for *fifty miles.* Think of it! Think of it!! The world stood amazed six years ago at the thought of sound being transmitted fifty miles, while now millions are listening to sounds that literally sweep around the earth.

What the World's Greatest Piano Teachers Demand

The most famous piano teachers of musical history from Czerny to the present day have always demanded a thorough drill in scales and arpeggios from all their pupils.

Several of the most distinguished teachers and pianists of the present day have recommended "Mastering the Scales and Arpeggios," by James Francis Cooke, in the most enthusiastic terms.

Mastering the Scales and Arpeggios, while a complete book of exercises, begins with the simplest possible kind of material which the smallest child can take.

Entirely new and original ideas and exercises found in this book make scale and arpeggio study a pleasure.

The sale of the work has increased every year—the best possible test of its real practical worth.

Mastering the Scales and Arpeggios will be sent to any recognized teacher on sale or on receipt of the price. $1.50 postpaid.

You will soon see why Gabrilowitsch, Liebling, Jonas, Goodson and other famous masters of the keyboard have eulogized this work.

Published by the THEODORE PRESSER COMPANY
1712 CHESTNUT STREET PHILADELPHIA, PA.

"Doesn't he play superbly. He certainly brings out all there is in a piano."
"Yes. And what a wonderful ally he has in that piano."

The Assurance One Feels when Owning a Good Piano

What a pleasure it is for the owner of a Weaver Piano to entertain a gathering of friends with a musical evening. What assurance such a hostess may feel as the artist brings forth its beautiful tones in piquant staccato or thundering forte. What enjoyment she sees on the faces of the absorbed listeners. What pride in owning such a superb instrument.

The wonderful qualities of the Weaver charm the listener, and thrill the player. And this beauty of tone and mechanical perfection that so distinguish the Weaver remain unimpaired through a lifetime of constant use. Time serves only to increase the cumulative enjoyment and satisfaction of its possessor.

Your home should have a good piano. Write for the interesting Weaver catalog, describing how the Weaver piano is built, and why it gives years of satisfaction. Convenient terms are easily arranged, and a liberal allowance made on your former piano. Weaver Piano Co., Inc., Factory and General Offices: York, Pa. Weaver, York and Livingston Pianos and Player Pianos.

A "Special Quartet Choir Service"

INTEREST is the mainspring of all advancement. Whatever will assist our readers to some new accomplishment is always a happy discovery to us. And so we are glad to reproduce the following from *The Diapason*, a very much alive publication for organists, and for all engaged in the musical service of the church.

"Walter Lindsay, organist and director at the Oak Lane Presbyterian Church, Philadelphia, has worked out an interesting plan for special services by his quartet which provides a means of making the music selected more vivid to the minds of the audience through the proper arrangement of the program and the interspersion of Scripture passages which are appropriate. Mr. Lindsay's plan, tried in the spring and to be repeated in the approaching season, has the advantage of giving the effect of the singing of a cantata, yet offering the opportunity to select music suitable to the forces at his disposal.

"In a service entitled 'A Meditation on the Life of our Lord.' the order was as follows: Our Lord's Coming Is Foretold (Isaiah 61: 1-3); bass solo (with violin and organ), recitative, *'Thus Saith the Lord'*; air, *'But Who May Abide the Day of His Coming?'* from 'The Messiah,' Handel; His Birth (Micah 5:12); quartet, violin and organ: *'Bethlehem,'* Homer N. Bartlett; soprano solo, 'The Infant Jesus,' Pietro A. Yon; His Rejection and Death (Isaiah 53:6-9); contralto solo, *'He Was Despised,'* from 'The Messiah,' Handel; solo and quartet, *'Calvary,'* from 'Olivet to Calvary,' Maunder; His Resurrection (Psalms 16:8-10); anthem, with violin and organ, *'In the End of the Sabbath,'* Macfarlane; tenor solo, with violin obligato, *'Hosanna,'* Granier; His Ascension (Psalms 47:5-7); anthem, with violin and organ, *'Leave Us Not,'* Stainer; His Reign in Glory (Revelation 5:11-13); violin solo, *'Adoration,'* Borowski; anthem, with violin obligato, *'O King Immortal,'* F. H. Brackett; Conclusion (1 Timothy 3:16); Benediction (with Choral Amen); organ postlude, Religious March in E flat, Parker.

"Writing on the plan he has carried out, Mr. Lindsay says among other things:

"'I suppose most organists who have quartet choirs find some difficulty in getting up special musical services; the average cantata is too big and too laborious for the quartet to give properly and an ordinary mixed program is too much like a Sunday evening sacred concert to suit many of us. So I devised this scheme for a service we were asked to give. After a very short introductory portion the 'meditation' begins. You will see that there are short Scripture passages indicated. The minister reads these and the music follows promptly as he finishes each passage. A glance at the headings will show the scheme of the service and the nature of the subject admits of the greatest variety in the pieces, so that there is no monotony to the listeners.

"'As planned, with the selections used, the service takes just an hour. It ought not to be much longer if it can be helped. Each of the quartet had a type-written schedule of the program showing where each one stood, or sat down, or remained standing during a Scripture reading. By following this, it was possible to avoid any hitch in connecting the parts; there was always somebody ready to take up the next number on time.

"'The success of the service went beyond our expectations; it gave the general effect of a cantata, in that a connected story was told; yet we were able to select music suitable for the forces at our disposal, and incidentally prepare the program without a disproportionate amount of labor—which last, even if the least consideration, is not unimportant to busy people such as most of us are.'"

Some Interesting Facts About Sacred Music

For a long period of the middle ages the only participation that the congregation was entitled to have in the singing part of the church service was in the short responses, "Kyrie Eleison." Charlemagne even went so far as to forbid by law the singing of secular songs in the streets, so that the only musical expression of many people was the "Kyrie Eleison."

The adoption of Lowell Mason's hymns was very widespread. In Scotch hymnals of the present time some thirty-four are said to appear.

The Gospel Song was not originated by Ira D. Sankey, as many people have assumed. Long before Sankey's trip to England, where he met with great success, there were songs of a similar type in wide currency. They came from the activities of such men as Kirkpatrick, Philip Phillips and W. Howard Doane, but principally P. P. Bliss. Sankey was the veriest amateur in his musicianship, while Bliss was a real musician. Thus Bliss became the senior editor of "Gospel Hymns" and Sankey his assistant. "Gospel Hymns" are said to have sold more than any other book with the exception of the Bible.

In purchasing a new organ it is said to be desirable to give approximately ten per cent. of the floor space of the edifice to it. Some recommend as low as six, but most organs are hurt by cramped space. This is an important point in an investment as large as that which the modern organ demands.

What It Contains: General Instructions, Photos, Pointers on Reed; Embouchure, etc., also *Forty-four Complete Lessons, Including* Tone, Breathing, Tonguing, Syncopation, Low Tones, High Tones, Slurring, Intervals, Staccato, Vibrato, Tongue-Flutter, Slap Tongue, Glissando, the Laugh, Notes above "High F," Transposition, together with Solos, Duets, Trios, etc. *The Most Wonderful Instruction Book Ever Published. 344 Pages.* **Price $4.00.**

AUSTIN ORGANS

NEW YORK, Philadelphia, San Francisco, Chicago, Detroit, Los Angeles, Richmond, Atlanta, Charleston, Minneapolis, Cincinnati, Seattle, Troy, Worcester, Baltimore, and many other large centers are possessors of notable Austin organs.

Over twelve hundred are now in use, representing an average output, since active operations a quarter-century ago, of about one organ a week.

The list of Austin owned patents runs into scores.

Question and Answer Department

Conducted by ARTHUR DE GUICHARD

Always send your full name and address. No questions will be answered when this has een neglected.

Only your initials or a chosen nom de plume will be printed.

Make your questions short and to the point.

Questions regarding particular pieces, metronomic markings, etc., not likely to be of interest the greater number of ETUDE readers will not be considered.

ovable Do Versus Fixed Do—for Vocalists.

Q. *In teaching Solfeggio, I should like to iow regarding a change of syllables (note- ames) in cases where the key changes ac- tally, by the introduction of sharps or flats it not by change of signature. For me, iis is often the easiest way to master a pas- ige, whereas retaining the names of the orig- ial key is a positive detriment. A pianist ould certainly note the change of key, why ot the vocalist? It seems there are some ho object to the practice, and I wonder if I m justified in its use in public-school work.*— . P., Kingston, Mass.

A. There are two Solfeggio (sight-read- ig) systems: the Fixed Do, wherein the note is always Do; and the Movable Do, where ie keynote, major, is always Do—whether be the keynote shown by the signature, or ie keynote of some passing passage. This Iovable Do system is much to be preferred y vocalists, for many cogent reasons—chief mong them being greater certainty of intona- ion. You are quite justified in its use. Some iusicians read chiefly by intervals. I know little girl of twelve who does not know the ames of the Sol-fa notes and yet who reads apidly and correctly the most difficult music. ut she possesses an unerring sense of ab- olute pitch.

Transposing Instruments.

Q. *Why is it necessary to have transpos- ng instruments? Would it not be possible o have all instruments in C?*—D. J. C., Bath- ate, No. Dak.

A. Asking the question another way: Why is it necessary to have different voices soprano, alto, tenor, bass)? When a tenor r a bass voice reads an ordinary song writ- en in the G clef, he transposes it an octave ower unconsciously, because his voice is an ctave lower than the female voice, as in- icated by the G clef. In like manner, the woman, reading a melody written in the F lef, transposes the air an octave higher, because her voice is an octave higher than hat of the male. Each voice has its own nherent, distinctive quality and color of ound—and each instrument similarly. For example, the clarinet in C has a much harder nd less sympathetic quality than in B♭. Hence the latter is usually preferred and, while it sounds a whole tone lower than the written music and therefore transposes, the music itself is written transposed a whole one higher. Taking the vocal parallel again: Let a soprano sing, from music in he G clef, "Believe me if all those endearing young charms," in the key of G. Then strike he chord of E♭ and let a baritone voice re- peat the air. The result will be immeasurably superior—and the baritone has, unconsciously ransposed the air a *tenth lower*. Assuming he possibility of having all instruments in C, the result would be most unsatisfactory.

The "Moonlight" Sonata and Pedals.

Q. *I have studied Beethoven's "Moonlight" sonata with two teachers; the first told me that "senza sordini" meant "without pedals" and did not allow me to use any; the second teacher said that it meant "without dampers." Who is right, and how should I play the passage?*—C. G., Back Bay, Mass.

A. The second teacher is right. The right-hand (or, is it the right foot?) pedal, mis-called the loud pedal, *is the damper-pedal*, because when used it raises the dampers and thus allows the vibrations to continue. In the movement in question, the damper-pedal should be pressed down immediately after striking each bass octave and kept down for the duration of each bass. But there is also another direction, namely, *una corda*, meaning "one string." This is obtained by putting and keeping down the left-hand or soft pedal. Thus, instead of "without pedals," two are used: the damper or right pedal and the soft, or left pedal.

The "Sine qua non" for Composition.

Q. *From several good teachers I have studied Harmony, Counterpoint, Canon, Fugue, Melody-writing and Composition in general, for it is my ambition to become a good composer and write songs. Although I have become proficient in all these subjects, provided the exercises and musical material (subjects, themes, figured basses, etc.) are given to me, I have never been able to invent any melody or any harmonic sequence. My present teacher tells me that, without the ability to invent, I can never become a composer. Will you kindly advise me? My age is 29.*—Aspirant, St. Louis, Mo.

A. To answer frankly: your present teacher is quite right. Apply a parallel argument: Wishing to be a writer of short stories, you study your Language in all its branches: Orthography, Etymology, Syntax and Prosody; the Analysis of sentences, Style and Literary Composition in its different forms. All of this is excellent and absolutely necessary, if you would write coherently and competently. *But what are you going to write?* "Short Stories." *Original* short stories, of course; but, having no story to tell and being unable to invent one, you cannot apply the technical knowledge which you have acquired! This might serve you to criticize the work of others, but would not endow you with the power and gift of invention. Even so with Musical Composition. To "compose" songs or other music, you must have original ideas to express and the ability to invent original melodies and harmonies. This is the composer's *Sine qua non*: a thing without which another cannot be.

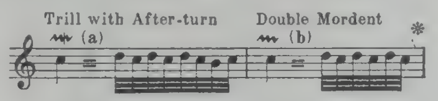
Upright and Grand Pianos.

Q. *Please explain the difference between the upright and grand pianos as to action. Will one used to an upright find it difficult to play on a grand? Is there any difference in the use of the pedals?*

A. From a performer's point of view there is practically no difference in action between an upright and a grand piano. Without any change in method, one can play with the same facility on the one as on the other. There is no difference in the use of the pedals. For complete description of the genesis and growth of the instrument, down to the present time, consult "History of the Pianoforte" (Hipkins), or any good Dictionary of Music.

The Double Mordent and Bach's Ornaments.

Q. *Will you please explain the difference between (a) the Trill with after-turn and (b) the Double Mordent? Where can I find a copy of Bach's own list of Ornaments?*—EMILIE KALHAUGE.



A. You will find a list of Bach's Ornaments, as written by him for his young son, Friedmann, in a copy of the "Partitas," J. S. Bach, Book I, revised by Maurice Emmanuel, published by Durand & Co., Paris (France).

* Note: When there is no perpendicular stroke through the sign, there is no after-turn.

Can I Be a Teacher of Piano?

Q. *Will you kindly advise me if I could possibly give piano lessons? I have been studying for three and a-half years and with one teacher. I wish to become a well-educated musician, but my family is unable to help me financially. An affirmative reply would greatly encourage me.*—THERESA V. P., Cambridge, Mass.

A. As your musical acquirements and your teaching ability are completely unknown to me, it is impossible for me to advise you positively. The proper person to do that is your own teacher. In any event, it would be well for you to remember and to heed always that: *we must know much to be able to teach a little.* In other words, you must be far in advance of the grade you propose to teach, and you must know most thoroughly everything pertaining to that grade —and then more.

Temperament: Equal and Unequal.

Q. *If C♯ and D♭ on the violin are not exactly the same pitch, how can the same tone be produced by the violin and piano, or violin and the organ, being sounded together? Why should there be any difference? What about the voice?*—A. C. D., Cowesett, R. I.

A. The difference in pitch arises from the variations in number of vibrations of the interval. The system of tuning for the piano is that termed "equal temperament." By this the octave is divided into twelve equal semitones, so that C♯ and D♭ are the same in sound. Other systems of tuning, classed under the head of "unequal temperament," show certain vibrations from the "true" which result in a difference of pitch between similar notes of "equal" and "unequal" temperament. The discussion of the subject is too lengthy to be treated adequately here. You would do well to consult Helmholtz, A. Ellis, F. R. S., Woolhouse's Essay on Musical Intervals. See also the Encyclopaedia Britannica, under "Acoustics," "Pitch" and "Temperament."

Ut—Do—Fixed Do—Movable Do.

Q. *Please tell me the meaning of "Ut dièse" and of "Ut." What language is it?*—R. A. C., Boston, Mass.

A. "Ut" is the French term for the note C. It is the first syllable of the hymn to St. John, from which the notes of the hexachordal scale derive their names (Ut, re, mi, fa, sol, la). The French, in their solfeggio, employ also the Italian names (Do, re, mi, fa, sol, la, si, do), but the Ut or Do always indicates the note C, whence their system of solfeggio is termed the "fixed Do," in opposition to the "movable Do" solfeggio, wherein the first note of every major scale is always called Do. The word "dièse" is French for ♯; thus "Ut dièse" means C♯.

KIMBALL

"The Instrument of Yesterday, Today and Tomorrow"

HARRISON M. WILD, Conductor of the famous Apollo and Mendelssohn Clubs of Chicago, and an organist of national reputation, expresses his entire approval of Kimball Pianos through his use of them for more than twenty years.

Among other leaders to signify esteem of the Kimball was the late Marcel Charlier, Director of French Opera, who said: "The Kimball Piano has my sincere and cordial endorsement."

Thus leaders of our own and other lands have through the years commended the Kimball as *eminently* satisfactory—the instrument of imperishable fame.

The Violinist's Etude

Edited by ROBERT BRAINE

It is the Ambition of THE ETUDE to make this Department "A Violinist's Magazine Complete in Itself"

A Letter-Lesson on Beethoven's Minuet in G

By Frank L. Willgoose

DEAR TOM:—Sure, boy! it's a pleasure! No matter if I am on my vacation, I can always find time between the rounds of golf and the fishing trips to help you.

The Beethoven Minuet is a tricky proposition for any violin student. It is one of these pieces that everybody plays at and scarce-a-body plays. Like that slugging machine at the fair; everybody takes a swing with the mallet, but nobody rings the bell at the top.

Now I'm going to try an experiment on you, Tom. I'm going to give you a lesson by correspondence, and the famous piece you are having your troubles over will be the subject of it. When we get together again in September you can tell me how you liked it.

Well, here goes!

The Beethoven Minuet is a shining example of a piece in which the musical and technical difficulties are about evenly balanced. Just now we will wrestle with the technical part of the piece, touching on its musical beauties only as may affect the performance.

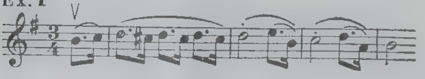
Here is the reason for this:

To bring out the beauty of a master's work, your technic must be faultless.

I want you to force-feed yourself on this idea day and night, sleeping and waking, for six months; and at the end of that time the effects of it will stick out all over you.

Take out your violin now and try the opening phrase:

Ex.1



You made a clumsy job of it, didn't you? If there is anything this piece needs it is polish, finish and delicacy of treatment.

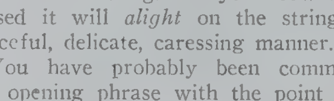
Once again. Poise your bow carefully in the air with the lower third part directly over the A string. Now commence the up-stroke from this point, letting the bow move in the air slightly before it touches the string. If your bow is well poised it will *alight* on the string in a graceful, delicate, caressing manner.

You have probably been commencing the opening phrase with the point of the bow. You do not need a whole bow for these first two notes. Begin where I suggest and you will achieve a far better effect.

The Question of Rhythm

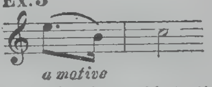
Now pass on to the down bow right after the bar line. Here we run bang up against something of the utmost importance. It is the question of rhythm. *Rhythm*, Tom, not *Time*. You know the difference. Each beat of this measure is composed of a dotted eighth and a sixteenth. This makes it possible to divide the beat up into four parts, the dotted eighth being three of the parts and the sixteenth the other one. You remember your old failing in this particular rhythm. You used to divide the beat into three parts instead of four. Now if you do this it results in a sloppy, lifeless sort of rhythm that is wholly lacking in character. Not only that, but the whole of the first part of this compostiion has a lovely, tender, clinging quality that is beautifully brought out by giving the dotted note full, or a trifle more than full value

Ex. 2



Look now at the third beat of the third measure. (Count the incomplete measure at the beginning as No. 1.) Here you will find something of great importance. This beat and the half-note of the following measure form what we call in music, a motive.

Ex.3



Now make this beautiful little figure stand out, like one of the brilliants in a piece of jewelry. In order to do this, stop the bow dead after the second beat of the third measure, and do the same just before the figure is repeated one degree lower in the scale.

This is the kind of thing we mean when we speak of "good phrasing"—the division of the theme into sentences, strains and motives. It would be just as senseless to play without observing these as it would be to gabble a piece of poetry or prose through without any stops.

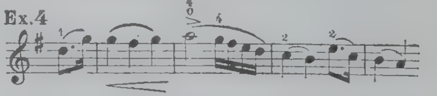
Resultful Practice

Now you see how much real, solid, nutritious stuff we have been able to extract from just four measures. By spending an hour or so on passages such as these you will get immeasurably more good than by playing a piece from beginning to end and then going through it again and again. It is by such practice as this that our platform giants are made.

Keeping these points in mind, try the effect of the whole four measures, playing them with the greatest ease, grace and delicacy of which you are capable.

Now I want to skip over a few measures to a passage which for emotional effect is the most beautiful in the whole piece. Immediately after the double bar we get this:

Ex.4



There is one technical effort that you must make which is vital to the proper rendering of this little phrase I refer to the group of four sixteenth notes at the end of the second measure. This little group must be rolled off the fingers as deftly and cleverly as the jugglers do their tricks. Getting it right is more a matter of rhythm than of anything else. Be sure to hold the note immediately preceding, its full two beats, then run down the four notes neatly and cleanly, landing on the C of the next measure exactly in time for the first count. If this little figure is well executed and is preceded by a nice crescendo up to the half-note A, the effect is exceedingly fine.

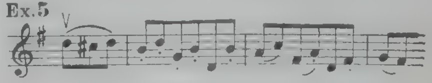
Now pass on to the next section, which is sometimes call the trio.

You have often been at a vaudeville show where the trapeze performer performed some particularly daring feats and then proceeded to top off with something particularly hair-raising. Ever notice what he did? In order to make the spectators' skin creep with dread anticipation, the music stopped and a deadly silence prevailed.

This Beethoven's Minuet that you are working on is so well known that as soon as you approach the trio, your listeners are all keyed up waiting to see how you are going to get away with it. They cannot do as the trapeze performer,—stop the music, but they do something just as good,—they hold their breath. They create such an atmosphere for you that if you do it well the effect is electric, but if you do it badly, the result is disastrous.

If I tell you the secret of this part of the composition is in the proper handling of the bow, you say, "Fine, but how am I to handle the bow?" So, Tom, I am going to try to show you bit by bit just how to trip off this most effective piece of writing which begins:

Ex.5



Place the bow on the strings half way between the middle and the point. Playing the three opening notes with an up bow, you will come to the middle of the bow for the beginning of the following measure.

Now play the separate, detached notes with a half bouncing, half stroking motion of the bow. Keep a firm, yet not hard grip with the fingers, and at the same time have a nice sense of balance with the wrist. Having got the right action and the right balance, the next difficulty is to strike the string in absolutely perfect time. Just make yourself hit the string when it should be hit. This will require a lot of concentrated effort but, nail this idea down tight: *when you have mastered a certain difficulty in any particular piece, you have at the same time conquered a host of passages where the same difficulty occurs.*

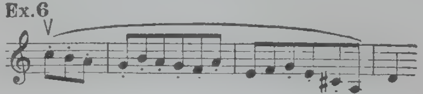
Now do you feel better?

Variety Through Bowing

In the next measure—the third of the *trio*, we have two ordinary slurred notes and then two staccato notes played in one bow, and then two detached notes. Each beat of this bar is different. The treating of the bowing in this way gives charming variety but, of course, adds to the difficulty of the performance.

In the next measure we get still more staccato notes of the one-bow variety, and again in the next and also in the following bars to the end of the passage.

Ex.6



This kind of staccato is the most effective bowing trick of the violinist's whole bag, and when played at great speed is very difficult. Fortunately for you, Tom, this particular example does not need to go fast. In order to accomplish this gracefully and effectively let the bow hand move forward from the wrist in a series of little springs, the bow resting on the strings during the playing of the whole passage. A slight pressure applied at each note by the forefinger of the bow hand will help you greatly in acquiring the trick.

The second part of the trio has exactly the same kind of technic as that just described, but there is one final tip I want to give you in regard to the whole of it. *Keep close to the middle of the bow!*

If you work these ideas out carefully, old fellow, giving them your best concentrated essence of thought, your difficulties will disappear as if by magic, and when I come home you will be able to play me the Beethoven Minuet like a young artist.

"Rome was not built in a day," neither was a violin technic, but every difficulty you conquer is one more stone added to your edifice.

Sincerely,
YOUR DEVOTED TEACHER.

Ask Your Teacher

IF you are under restriction in violin playing, and are invited to play in public, ask your teacher what to play. It would seem that this would be so self-evident that it would not have to be mentioned; but the fact is that many students pick out their own selections for public performance, without saying anything to their teachers beforehand. In long years of experience in teaching it has often happened that a pupil would inform me that he had played a violin solo in public. When he told me what he had played, or rather tried to play, it sometimes almost made my hair stand on end. For the piece was either totally unsuitable to the occasion; it was something that he had only half learned; or else it was unfitted by temperament to do justice to. Pupils will also sometimes get entirely new solos on their own hook, and, without even showing them to their teachers, will try to learn them, themselves, and play them in public. They seem to think that it is a good joke to "put one over on the teacher" in this manner. It is needless to state that they often come to grief.

Many conservatories and colleges of music have a printed rule in their catalogs that pupils will not be allowed to play in public, on any occasion, inside or outside the conservatory, without permission; and, if the necessary permission is given, the selection they are to play must be chosen by their teacher. This is a wise rule, and pupils who abide by it are invariably successful.

If a pupil is to succeed in a public appearance three things are necessary to success. First, the composition must be of a character suitable to the occasion; second, the piece must be perfectly learned; third, the composition must be suited to the temperament and talent of the performer.

Good judgment in picking out compositions suitable to special occasions has been the making, not only of many students, but also even professional violinists. We have church audiences, and "high-brow" audiences, important concert audiences, audiences consisting mostly of children, and popular audiences of people who know nothing about music, but who only want their ears "tickled" by something which can be easily digested. The wise performer will choose his program carefully with a view of suiting and pleasing his audience.

Even professionals often miss it, woefully, in choosing selections for various audiences, and play something so heavy that the audience has not the slightest idea what it is all about; when they could have given great pleasure by choosing something of a lighter nature.

It is of great importance that the composition should be perfectly learned. Many a student makes a failure by trying to play something he has only half mastered. In this matter the judgment of his teacher is all-important. In selecting for him the wise teacher will choose something which he really knows, and has thoroughly mastered. This also disposes of the horrors of stage fright and nervousness, in ninety-nine cases out of a hundred. One of the most successful teachers I ever knew, who, during long years of professional activity, gave a pupils' recital every week of his life, during the teaching season, once said:

ROMANCE in A—by Thurlow Lieurance

FOR VIOLIN AND PIANO — Catalog No. 13017, Pr. 60c

The sale of this number has been great because it possesses melody that pleases the average and character that satisfies the musician.

THEO. PRESSER CO. 1712 Chestnut St., Phila., Pa.

"Most cases of stage fright come from lack of preparation. The pupil who has learned his piece perfectly, so it is *really easy* for him to play, does not worry about facing the public. He stalks on the stage as bold as a lion. The student who has only half learned his piece, and knows of half a dozen places in the composition where he is likely to break down, naturally walks on the platform with shaking knees, and is of course 'crazy nervous' before he begins. Naturally enough he is pretty sure to break down at the points he fears. If the pupil cannot play a difficult piece let him play an easy one, no matter how easy, just so it is well done. Audiences do not judge by the names of the pieces on the program. They go by what they hear with their ears. A difficult piece, which is simply butchered by a young violinist who wants to play something ambitious, gets nowhere; while the easiest selection, played in an artistic manner, pleases every one and is an instant success.

"Another important thing is that the composition should be suited to the temperament and talent of the performer. Some pupils excell in pieces of a slow *cantabile* character, while others do better with brilliant, showy pieces with lots of velocity passages in them. There is nothing like 'putting the best foot foremost.' The teacher should choose for the pupil a composition which is best suited to his temperament. We find that among professional violinists, different players do better with one class of compositions than another. I have known many violinists who could set an audience wild with a bravura performance of a Paganini concerto, but who would be insufferable in the Bach *Chaconne*.

"Many a public artist owes success to skill in program building, considering first what he plays most successfully, and next what will be most acceptable to his audiences on various occasions. I do not wish to convey the impression that the artist should 'let down,' and play cheap or inartistic music for audiences whose knowledge of music is slight. Programs to suit audiences of every character can be built up without departing from the realms of music of the highest artistic worth. It all lies in the skill in selecting it.

So let the pupil make it a rule never to appear in public without advising with his teacher, whether to accept the engagement at all, and if he does, what to play. The wide experience of the teacher gives him the necessary knowledge to select what is best for the pupil to play, and the pupil who is guided by that knowledge almost invariably meets with success.

"I have even known professional violinists who counselled with critics, musical friends, and musical authorities on what to play on some important occasion."

IT'S REALLY SURPRISING HOW

Stuber's "Instrumental Music Course" has met with the warm approval of supervisors and teachers.

The coming school year will find this course forming the backbone of public school instrumental music in many of the more advanced cities. Its practicability has been proven by four years' use in public schools. Constant revision keeps it up to date in every particular.

We would appreciate the opportunity of sending complete copies on approval to supervisors and teachers.

How to Arrange a Saxophone Part

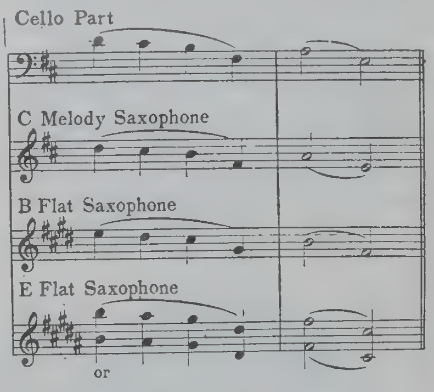
By E. H. P.

ORGANIZERS of amateur orchestras in schools, Sunday schools and elsewhere are often embarrassed these days by the oversupply of saxophone players. (Sometimes even *one* saxophone player is an oversupply!) The use of this instrument for popular dance music has given the impression that it is a regular orchestral instrument, which is by no means the case. Most composers of orchestral music have avoided it altogether, and supply no part for it. In brass-band music, however, it is more highly esteemed, and compositions for full band commonly contain parts for four saxophones.

However, we must take things as we find them. Personal reasons and sometimes the absence of sufficient other instrumental players constrain us to use a saxophone, and the question is what to do with it.

In recent dance music, parts for saxophones are now generally published. Where they are not, the C saxophone may play from the oboe part without changing a note; although the effect is not the same, as it will sound an octave lower. There is, by the way, a C *Soprano* saxophone which sounds the same pitch as the oboe, but it is not commonly in use. Lacking an oboe part, the C saxophone may double the first violin part, simplifying it somewhat, and transposing an octave upward or downward in places where the compass runs too low or too high. But, frankly, these are rough and inartistic expedients. The best effect is obtained by having the saxophone play a cello part. Although the compass of the cello runs considerably lower than the saxophone, its most common use is in a register entirely practical and most agreeable to that instrument.

A saxophone player *might* learn to read directly from the bass clef on his particular instrument, just as a bassoon or a trombone player does; but as this seems to be an exceedingly rare accomplishment, we will treat of the subject from the standpoint of transposition. We give, below, a couple of measures of a cello part, together with its proper rendering on the three different saxophones in common use. By careful examination of this, any player may see how to make the proper transposition for himself, or any leader may prepare a manuscript part for his player.



We call particular attention to the following facts:

1. In the "C Melody," the signature and all accidentals remain the same, only the note-heads are all lowered by two lines and a space.

2. With the "B-flat" saxophone, two sharps must be added to the signature, or

How to Arrange a Saxophone Part

(*Continued from page 352*)

two flats subtracted; and each note-head will be lowered two spaces or two lines, as the case may be.

3. With the "E-flat" saxophone, all notes stay in the place where they are, but three sharps must be added, or three flats subtracted from the signature. This really sounds an octave *above* the cello. To produce the exact pitch of the cello, play it an octave down, like the lowest notes in the example.

Note that these transpositions are all from the *bass* clef. They would not hold good in the (somewhat rare) cases in which the cello part runs into the tenor clef or the treble clef; but the clever musician, who has once grasped the principle of the thing, will easily puzzle out these for himself.

Accidentals are the worst stumbling blocks. In general, a sharp makes a sharp and a flat makes a flat, but if they land on some degree of the scale which is already affected (in the transposed copy) by the same sort of sign, then they make a *double* sharp or a *double* flat, respectively. In the case of a natural observe whether the effect of it, in the original, is to *raise* the note (by cancelling a flat) or to *lower* it (by cancelling a sharp), or whether it simply restores the normal notes of the scale indicated by the signature.

Another Expedient

If your orchestra already has a good cellist, or if you already have one saxophone taking the place of a cello, and wish to employ others, the best place to put them is on French horn parts. These parts are generally written in pairs, and sound much better if you have the two instruments than if you have only one. The horn parts are generally very easy on a saxophone, which is an added object with amateurs.

Although in the earlier classical music the horn appears with a great variety of transpositions, one can depend on music published at the present day (including even reprints of the classics) using the "Horn in F." We will accordingly illustrate the method of transposition for the different saxophones where horn parts "in F" are in use.

Fray Pedro de Gante

The First European Music Teacher in America

By Frederick M. Noa

El Universal, of Mexico City, calls attention to the fact that, four hundred years ago, in 1523, the Spanish missionary, Fray Pedro de Gante, destined to become the first teacher of music in America, arrived at the port of Vera Çruz. He set foot on Mexican soil on the 13th of August, and he was one of many missionaries sent over, at the request of the haughty Cortez, to convert the Mexican aborigines and to consolidate the Conquest.

The padre is thought to have been a blood relative of Emperor Charles V, but little is known about his parentage and ancestry. He appears to have received a good musical education in the University of Louvain, Belgium, and in Salamanca, Spain.

In the course of time, he forsook the solitude of his cell in a monastery called Gante, in Spain, and undertook the tedious sailing voyage westward on to America. From Vera Cruz, he went to Mexico City, intending to settle there, but the unsettled state of public affairs caused him to retire to Tezcoco and there he set about learning the language of the Indian natives.

For a lover and teacher of music, no more fit abode could be chosen than the enchanting Tezcocan Valley. In 1524, Fray Pedro de Gante had sufficiently mastered the local Indian dialect to enable him to open a school for the children of the caciques or chiefs. The coöperation of Ixtilixochitl, an ally of the Spaniards, greatly facilitated his work. The arrival, in the same year, of the first twelve Franciscan missionaries, accelerated the teaching of music and singing. Three years later, so large a number of music instructors had arrived from Spain that Father Pedro transferred his labors to Mexico City, where in the Monastery of San Francisco, he spent the rest of his life.

He developed a very comprehensive plan of instruction, including reading, writing, practical arts, singing and the technic of musical instruments. The fundamental purpose of his school was to utilize his Indian converts for church music and ceremonies. Under his instruction, his pupils attained remarkable proficiency in singing and the copying of musical notes, melodies and harmonies, beautiful specimens of their work existing today in Mexico. So effective were the labors of Father Pedro de Gante, that there was no village which did not have good, trained singers and musicians. The Indians were taught to make their own musical instruments, of excellent workmanship and quality.

The development of music in Mexico owes much to this faithful, humble Spanish Franciscan missionary. He set the national musical current flowing, the fruits of which, four centuries later, are the National Mexican Opera, which has the most beautiful edifice of its kind in Latin America, and the Mexican National Conservatory, which opens its doors free to all aspiring Mexican young people who desire to learn the true art of music.

"I cannot express either my feelings or my thoughts in verse, for I am neither a poet nor a painter. But I can do this with sounds, because I am a musician."—MOZART.

EXCEPTIONAL SUMMER STUDY ADVANTAGES
Mrs. Martha D. Willis Summer School of Music
WACO and BRYAN, TEXAS—Enrollment June 4
Children's Classes—Pianoforte Instruction—Normal Courses for Teachers

NORMAL CLASSES FOR TEACHERS OF PIANO

AND

TEACHERS' TRAINING CLASSES

FOR

PIANO STUDENTS WHO WISH TO BECOME TEACHERS

CONDUCTED BY

John M. Williams

Author of: "Child's First Music Book", "Nothing Easier" or "Adventures of Ten Little Fingers in Mother Goose Land" G. Schirmer; "First Lessons in Piano Playing" (in press), Presser; "Tunes for Tiny Tots", Presser. Mr. Williams' series of articles entitled "What to Teach at the Very First Lessons" began in the January issue of "The Etude".

ITINERARY

CHICAGO............June 16 to June 28.
NEW YORK CITY ..June 30 to July 12.
SEATTLE.............July 21 to August 2.
SAN FRANCISCO ..August 4 to August 16.
SAN DIEGO ....August 18 to August 30.
LOS ANGELES......September 1 to September 13.
SALT LAKE CITY..September 15 to September 27.
DENVER ....September 29 to October 11.
TUCSON ....October 13 to October 25.
EL PASO ....October 27 to November 8.
SAN ANTONIO......November 10 to November 22.
DALLAS ....November 24 to December 6.
HOUSTON ....December 8 to December 20.
NEW ORLEANS ....January 12 to January 26.

Each Class will be of two weeks duration (daily class lessons of two hours each). Early enrollment is urged as the size of classes will be limited.

NORMAL TRAINING

Only recently has attention been directed o the important matter of preparing nusicians for their work as teachers. The JOHN M. WILLIAMS SYSTEM OF FUNDAMENTAL TRAINING is devoted SOLELY and EXCLUSIVELY to the TRAINING of TEACHERS of PIANO PLAYING, and prepares music teachers for the work of giving fundamental training to music students through the first four years' work.

This system shows the teacher how to plan a SYSTEMATIC AND CONTINUOUS COURSE OF STUDY FOR EACH PUPIL and provides teaching material for the first four years' work and suggests methods of presenting it.

Many teachers using this system are earning from $400 to $600 monthly.

ooklet describing the Course in detail sent upon request. Address JOHN M. WILLIAMS SYSTEM OF FUNDAMENTAL TRAINING, 449 West 123d Street, Suite 32, New York City

Every Convenience for the Teacher Seeking Music Supplies Is Offered in the Mail Order Service of the Theo. Presser Co.

This service embraces liberal examination privileges, low professional prices, convenient charge accounts and prompt, accurate and helpful service. Any teacher not familiar with the "On Sale" Plan should ask for details. By this plan, which was originated by Theo. Presser Co., the teacher may order material for examination and also may carry a stock of music throughout the teaching season, all not used or sold to pupils to be returned at the end of the season.

A few of the helpful lists and catalogs issued by the Theo. Presser Co., any of which may be secured by teachers for the asking, are: *Descriptive Catalog of Piano Collections.* Gives descriptions and contents of piano solo and piano four-hand albums, all grades. *Guide to New Teachers on Teaching the Piano.* A little booklet giving practical advice upon teaching and also including a graded list of the dependable teaching material (pieces, studies, exercises, duets, books, etc.) in all grades from one to ten. *The Music Teacher's Handbook.* Lists and describes rudimentary works, bookkeeping helps, pupil rewards, diplomas, musical jewelry, novelties, leather goods, pictures, post cards, etc. *Descriptive Catalog of Organ Methods, Studies and Collections. Descriptive Catalog of Vocal Collections. Descriptive Catalog of Violin Methods, Studies and Collections. Graded Thematic Catalog of Pianoforte Compositions. Excerpts from Excellent Songs.* This last shows portions of nearly 100 songs. *Catalog of Juvenile Music Publications.* Lists and describes easy piano collections, songs, games, operettas, etc., for children. *Descriptive Catalog of Musical Literature.* Describes some of the most used books on theory, musical history, biographies, etc.

We have many other catalogs and folders—let us know the classification of music publications in which you are interested—our Catalog Dept. will serve you cheerfully.

Commencement Awards

Many schools and colleges throughout the country are now preparing for the annual graduating exercises. The valedictorian is engaged in writing her essay, the soloists are faithfully practicing their "pieces," ensemble numbers are being diligently rehearsed; everything is being made letter perfect for this gala event.

Many graduates intend to enter the musical profession; some as teachers, some upon the operatic stage, others upon the concert platform. In every case their most cherished ambition is to obtain the coveted diploma.

It is not always convenient to obtain suitable diploma and certificate forms for music graduates at the local art stores. To supply this need, the Theo. Presser Co. has designed several forms that are particularly appropriate, and we are prepared to supply them to our patrons at very reasonable prices. Certificates for grade promotions may be obtained for 6 cents and 12 cents, blank diplomas, printed on a good quality of paper, 18 cents, and parchment diplomas for 50 cents or 60 cents. The diplomas, 21 inches by 16 inches in size, have an artistic design and those at 60 cents have appropriate wording for a graduate in music.

Some schools prefer special wording and the name of the school engrossed in Old English letters on the diploma. Through an arrangement with a local artist, we can have this work done in a most satisfactory manner and at a reasonable price, using our parchment diploma form at 50 cents, but we would suggest to any patrons who desire this special work that they place their orders in ample time to avoid delay and consequent disappointment. At least two weeks should be allowed between the time the order reaches us and the day of the commencement, and, in cases where the distance is great, even more time allowance would be advisable.

As a graduation award for the honor pupils we have a very neat musical design in the form of a medal or brooch which may be obtained either in gold or silver. The price of the 10k gold medal is $6, the silver medal, $3, while the same design in a brooch may be had in 10k gold at $4, or in silver at $1.50.

The medals have space on the bar for engraving the date or the recipient's initials, and on the reverse side of both medals and brooches the recipient's name, date, etc., can be engraved at a nominal charge. We kindly ask our patrons to make the same time allowance for engraving medals as requested for engrossing diplomas. We will gladly quote prices for special lettering or engraving, but be sure to send the exact wording wanted when writing for these particulars so that additional correspondence and consequent delay may be made unnecessary.

Jolly Jingles For Little Fingers By Helen L. Cramm

Miss Helen L. Cramm has been most happy in her little sets of teaching pieces for young players. The pieces in this new set are just a little past the first grade in difficulty. Several are just out of the five-finger position. Each piece has an appropriate verse in characteristic style which may be sung if desired.

The special introductory price in advance of publication is 30 cents per copy, postpaid.

Mother's Day Children's Day Memorial Day

Music always plays an important part in the observance of these special days, an appropriate solo, quartet or chorus intermingled with the exercises lending a most fitting touch of sentiment and often one of dignity to the program.

An anthem, *Memories,* by Gertrude Martin Rohrer is a very effective number for the Mother's Day program, as are the solos *Mother,* by Stanley F. Widener, *Mother o' Mine,* by Bertha Remick, and *Little Mother o' Mine,* by Herbert Ralph Ward. A new solo, *Old Fashioned Dear,* by Cecil Osik Ellis, will be much appreciated, the charm of both verse and melody making an instantaneous appeal.

There are a number of excellent services for Children's Day with music especially written for children's voices, and verses and recitations that will delight both the youngsters and their adult auditors.

For Memorial or Decoration Day we publish a number of quartets and choruses for either mixed or men's voices that are particularly suitable for inclusion in the programs in honor of our departed heroes.

Any of this material may be obtained for examination by anyone interested in forming programs for these occasions. Tell us your needs and we will gladly make up and send a selection for your approval, allowing you the privilege of returning any copies not suitable. PRESSER SERVICE is always at your command, and you are invited to make the fullest use of its advantages.

Nocturno A Musical Romance By Carl G. Schmidt

We have come into possession of this musical novel, which will be most excellent reading for the summer months. The work will be published at once and ready for vacation time. The story treats of the development of a woman's nature through the influence of musical composition—a nocturne—and interweaves a narrative of commercial life in New York City and the West. Interest is kept to the very last page of the work, and we recommend all music lovers to procure a copy, not only for the story, but for the inspirational value of the book itself. We musical people do not read enough on musical subjects. Many of us have read Tolstoi's novel on the Kreutzer Sonata. This is a similar novel on a "Nocturne" of Chopin. A work of this kind in the book store retails for $2.00, as it is bound in cloth, while on our advance of publication offer we make a special price of 80 cents per copy, postpaid.

The Fairies' Revelry Operatic Cantata By Richard Kieserling

A short cantata or musical play suitable for the close of a program.

It is suitable for concert or stage production and is written for soprano solo and a three-part chorus of treble voices, with piano accompaniment.

Rarely do we find such charming music. "The Dance of the Fairies," which is No. 4 of the six parts of the cantata, is very lovely and most suitable for women's clubs, although it is not too difficult for children in the grades.

Our advance of publication price for one copy only is 30 cents.

Little Folks' Music Story Book By James Francis Cooke

This is the story of music told for the very smallest music pupils. The chapters are very brief, very entertaining, very simple and very direct. All of the illustrations come on separate sheets to be pasted in designated places in the book. Thus the book becomes a "play book" and induces study along those delightful lines which have made music a joy instead of a bugbear to children. The book will be a very pleasant surprise to our patrons when it is received. The advance of publication, introductory price is 50 cents, postpaid.

Etude Title Page Contest

Every month for years, THE ETUDE h endeavored to make its title pages attractive, effective and practical as po sible. It is often very difficult for to secure the right subject, done in th right manner, by one with the talent an skill to produce a good cover. Music a broad field, but the number of real good musical subjects is limited. We hav therefore, announced elsewhere in th issue a prize contest of $250 for the be cover design. The name of the artist do not count in this contest. What we wa are the actual results. Covers that not win the first prize of $250 will be co sidered for purchase. What we reque our friends to do is to advertise this co test by word of mouth so that those inte ested in making covers will become a quainted with it. Every musician h some artist friend who might be ve glad to know of the contest.

Basic Principles In Pianoforte Playing By Josef Lhévinne

Lhévinne has brought into this sho but comprehensive series of conferenc the finest traditions of the Russian scho of pianoforte playing, from which h come many of our most able virtuos of the past fifty years. To this he h added his cosmopolitan experience. Eve phase of technic, touch and interpret tion is touched upon in this book whi was secured through a series of person conferences with Mr. Lhévinne by M James Francis Cooke. A definite effo was made to bring out just those fac which the average piano student mu know in order to insure a good found tion of piano playing in modern sty An introductory price, in advance of pu lication, is offered to all who send ca now to the amount of 30 cents, postpai

Album of Scales For the Pianoforte

This is one of a series of works th we propose publishing from time to tin The *Album of Trills* is already on t market and the *Album of Scales* will a pear shortly. The numbers in these v umes are not studies but study piece that is, pieces containing technical pa sages. They are of rather an early grad from two and one-half to three. All t pieces are of an interesting charact only those are used that have made th mark in accordance with their merit. T scale volume will contain some of o most popular numbers. The price will 75 cents, but, while the special offer is force, we will send it for 30 cents p copy, postpaid. We advise the membe of the teaching profession to procure least one copy of this interesting wo

New Recital Album For the Pianoforte

Good recital pieces in grades three five are always in demand. In this n volume, printed from special large plat we have assembled a collection of r gems. These pieces are interesting study and good to listen to, and, besid all this, the practice of them will res in real musical progress. This volu will contain an unusually large numb of pieces of the right type.

The special introductory price in a vance of publication is 35 cents per co postpaid.

The Amateur Musician By Russell Snively Gilbert

A great many students require a p mary book that will take them a bit furth than the Beginner's Book, something th will provide for the development of t musical imagination and awaken enth siasm. This is just what Mr. Gilbert h accomplished in this useful little work. H has created materials that will carry t early student on to a good working know edge of the rudimentary elements notation and of execution at the keyboa We heartily recommend this book to progressive teachers and in advance publication will book all orders for intr ductory copies at the special price of cents, postpaid.

at to Play— at to Teach

Harriette Brower

ow much would you give to have ous, authoritative answers to these ions? Surely nothing is more impor- to the pianist and to the teacher than now what has proved to be the best rials. Miss Brower's method of ap- ching the subject is different and tical. She has taken the programs of als and concerts given with success ew York City and has picked out the s that have met with the highest ap- al. Then she has rearranged the e mass of material according to es of difficulty. After that nearly composition mentioned has been ibed by notes giving an idea of its tiveness. Surely a large market ts this very practical book. Send the nce of publication price, 75 cents, aid, now and be assured of receiv- copy immediately upon publication.

nciples of Expression Pianoforte Playing

Adolph F. Christiani

more important work on playing the has not come from any press in , many years. Phrasing is the very lood of music, and any book which duces one to the secrets of this art valuable to the library of either er or student. This Mr. Christiani's does by going to the very bottom e matter and giving a clearly under- dable presentation of the principles *hythmical Accents, Metrical Accents, dic Accents* and *Harmonic Accents;* one of which has a most important to play in the proper interpreta- of the true spirit of a composition. first edition of the book had such ely sale that it has been out of print some time, and, in bringing out this edition, we feel that we are doing a service to the musical profession. work is well adapted to class use, ny grade above the second, as well or a reference book to be kept on study table.

ecial advance of publication price, per copy, postpaid.

st Lessons in Bach

Walter Carroll

e are forced to publish another Bach m of easy pieces because the constant and for this material makes this ssary. The one now in preparation dited by Walter Carroll. This was inally published in England and we reprinting from this edition. There 17 numbers of the very easiest studies ach in the volume. With the constant easing popularity of Bach we feel as- d of a welcome for this new work.

ur special price in advance of publi- on is 20 cents per copy, postpaid.

um of Compositions r the Pianoforte

M. L. Preston

lbums made up of the most popular positions of certain composers have n found very successful. This has ven especially so in the case of con- porary writers. Our *Engelmann Al-* and *Spaulding Album* in particular, e given pleasure to many. M. L. Pres- , writing also under the name M. b-Evans, has many successful pieces, re than sufficient to make up a good um. From these we have selected the y best numbers. This work will soon on the market.

he special introductory price in ad- ce of publication is 30 cents per copy, tpaid.

andard Vocal pertoire

bout forty of the best secular and red songs for all voices have been col- ted for this volume. These songs are by present-day composers and repre- t their best writings. Suitable num- s for church or concert use are here one book. The advance of publica- n price is only 35 cents, and every ger should take advantage of this op- rtunity to possess so many good songs und together.

New Instruction Book

By John M. Williams

We will continue this work on special offer during the current month, which will probably be the last, as we have positively promised the author to have it ready some time in June for his Summer Normal Schools. Mr. Williams is ranked as one of the leading pedagogs of the day, having been most successful along educational lines. He will conduct a certain number of Normal classes in various cities from June to January. An advertisement of his work in the various cities will be found on another page of this issue. The training that Mr. Williams will give is most valuable. Normal training is a feature in our education that has not received the attention it should. Mr. Williams is possibly the very best equipped for giving the teachers this necessary training. He begins in Chicago, June 16th, going to New York City June 30th, back to Seattle July 21st, and so on through the Western States and ending in New Orleans January 12th; thus spending two weeks in each place. He can be addressed either through THE ETUDE or at 449 West 123rd Street, Suite 32, New York, N. Y. His work, now in process of publication, will be used as one of the text-books. Read the advertisement and see if he will hold a Normal in your city; if so, help the good work along.

Our special price in advance of publication is 40 cents per copy, postpaid.

New Theory Book

By Preston Ware Orem

This book starts out from the point where the dominant seventh chord has been reached and goes at once into the practical making of music. Such additional knowledge of harmony as is needed by the student is given as the occasion may arise and is developed out of practical usage. Everyone who studies theory at all ought to endeavor to create. It is the best and surest way of developing real musicianship. And everyone who plays ought to study some theory at least. This book aims to be as practical as it is possible to make it, and is right in line with the principles given in the same author's *Harmony Book for Beginners.*

The special introductory price in advance of publication is 60 cents per copy, postpaid.

Thirty-Six Studies or Caprices For Violin

By F. Fiorillo

If any great violinist were asked for a list of studies which every violinist should have studied to be well grounded in the art of violin playing, there would be an almost unanimous answer: Kreutzer, Fiorillo and Rode. Opinions may vary as to what should precede these studies or what should follow them, but they are recognized as the backbone of violin etude study. They give unusually fine work in double stops, stretches and smooth passage work, and are of so musical a character that many of them are played by great violinists as concert pieces. Our edition of these etudes, being now prepared by Otto Meyer, whose choice by Professor O. Sevcik as his representative in the United States shows that he is especially well qualified to edit such study works, will soon be ready; and we are offering our new edition of the Fiorillo studies at the special in advance of publication price of 35 cents a copy, postpaid.

Holberg-Suite For Piano

By E. Grieg, Op. 40

This is a new volume in the *Presser Collection* and it will be ready soon. This is an *Opus* of Grieg's that is more than holding its own. The final number, *The Rigaudon,* has been popular always. *The Prelude* is being used a great deal as a study piece, and it makes a brilliant recital number. *The Sarabande. Gavotte* and *Aria* are decidedly charming numbers. Our new edition has been prepared with the utmost care.

The special introductory price in advance of publication is 25 cents per copy, postpaid.

Rhythms for Young People

By Blanche Fox Steenman

This book has been planned especially for use in schools, but it may be used to equal advantage in private and class teaching. It contains examples in every possible style, taken from the works of the classic and modern masters. In many cases the originals are given, while in others the pieces have been simplified slightly. All of the pieces are well within the range of the average player. Explanatory texts are given with each number besides special annotations here and there. This book is a real work on musical appreciation and its use will tend to develop a real knowledge and liking for the lasting things in music.

The special introductory price in advance of publication is 50 cents per copy, postpaid.

Music-Writing Book

By Anna Heuermann Hamilton

A good writing-book is almost indispensable to a young pupil. Nothing enforces a knowledge of things so thoroughly as having to write them out, and when this is coupled with a certain amount of original work, backed up by the necessary explanations, the student cannot help but make progress. This new writing-book is based upon the foregoing principles. The author is a successful educator, and this book is the fruit of ripe experience.

The special introductory price in advance of publication is 20 cents per copy, postpaid.

The Castaways—Operetta For Women's Voices

By Fay Foster

This exceptionally clever operetta will provide a most interesting entertainment for performance by women's clubs or by school, college and academy choral organizations composed entirely of girls' voices.

Fay Foster's music is most attractive and charming, with solos of distinct worth and choruses full of lilt and rhythm. The colorful, weird chanting of the native women is in splendid contrast to the melodic flow of modern tunefulness as voiced by the *Castaways,* who are American women of today shipwrecked on a mysterious island.

The plot is interesting, the costumes are strikingly beautiful as stage pictures, the action is quick, and there is much humor in the dialog.

Our advance of publication offer for one copy only, is 40 cents, postpaid.

Reverie Album For the Piano

This is in reality a drawing-room album devoted to pieces of the quieter and more elegant type. This would include *Reveries, Nocturnes, Songs without Words* and *Meditations.* The pieces selected for this volume are all of intermediate grade. It will prove an excellent book for Sunday playing, or for use in church where a piano is employed instead of a small organ. There is really a wide field for this book.

The special introductory price in advance of publication is 35 cents per copy, postpaid.

Songs for Girls

In response to many requests we are compiling a book of our best songs suitable for girls. No song text treats of religion and no text mentions romance. Songs about birds, flowers and all aspects of nature, with a few humorous and dialect songs make up a complete book suitable for concert or home use. Only the choicest material is included in this valuable collection, which may be ordered in advance of publication at the special price of 40 cents, postpaid.

Changes Of Address

If you wish your ETUDE MUSIC MAGAZINE to follow you on your summer holiday be sure to advise us at least three weeks in advance of your change in address, giving both the old and new address to insure against possible loss of copies.

(*Publisher's Notes continued on page 362*)

World of Music

(*Continued from page 291*)

Franz Lehar, of "Merry Widow" fame, according to report, has been commissioned to write an opera for the Metropolitan Company of New York, and has chosen "Romance," by Sheldon, as the source of his libretto. "Romance," as a play, was a success in America and an even greater one in England.

"The Village Coquettes," an opera founded on a play by Charles Dickens, and the music by the late Sir Frederick Bridge, is in preparation for a London presentation.

Edward Lloyd, for many years the premiere oratorio tenor of the world, celebrated his 79th birthday March 7. He leaped to fame by his wonderful singing of the tenor narrative in the "Matthew Passion" at the Gloucester Festival of 1871, and was the favorite tenor of our own Theodore Thomas.

The Chicago Civic Opera Company management announces that, because of losses sustained on performances of German Opera during the past season, presentations of Wagner's operas will be dropped from next year's repertoire unless a sufficient fund is guaranteed to insure against a similar deficit.

A $500 Prize is offered by the American Radio Association, 50 Union Square, New York, for the best answer to the question, "Who is to pay for broadcasting?"

A Complete Cycle of the Chamber Music of Brahms is to be given by the Elshuco Trio next season, in New York, as an extension feature of the Berkshire Festival movement.

Dvořák's "From the New World" Symphony, according to recent research, was finished at Spillville, Winnesheik County, Iowa, and the Iowa Conservation Association, for the purpose of preserving historic places, has started a movement to have this spot properly marked.

"Sakahra," an opera by Simon Bucharoff, the American composer, is to have its premiere at Frankfurt-am-Main, Germany, in April. Arthur Nevin's "Poia," produced at the Royal Opera, Berlin, in 1910, is believed to be the only other American opera to have had a German presentation.

Sixty-six New Operas were presented to the Italian public during 1923. Of these, thirty-two were operettas and the remainder of a serious character.

Arthur Hartmann, the American violinist who has been concertizing in Europe, will tour America for the coming season.

Bulletin of the Presser Home for Retired Music Teachers

On Thursday evening, March 6, The Presser Home Social Club was favored with an interesting and instructive talk by Wm. H. Moore, D.D.S. Dr. Moore's lecture was illustrated with fine screen pictures of the plant and animal life of Mexico. It gave an insight into the environments and customs of the aboriginal inhabitants (some of whom are cannibals) on both sides of the Sierra Madre Mountains, as well as the characteristics of modern Mexicans and their beautiful cities.

The Home is now fully tenanted, save for one of the rooms for the men. There is already a waiting list of five who have made applications for admission.

What the Vocal Student Should Know
By Nicholas Douty

This important work will be in the hands of our patrons very shortly. Mr. Douty enjoys the unique distinction of having been the solo tenor at the famous Bach Festivals at Bethlehem since the inauguration of the famous choir. No more exacting experience has ever been had by any other American singer. Years of successful day-in-and-day-out work as an artist teacher of singing in Philadelphia, years of experience as a practical musician, qualify him to say with authority "What the Vocal Student Should Know." In telling this he goes farther. He gives the vocal student the actual practical materials to enable him to advance himself. The daily studies are all in the book. You now have only a very short time to order copies if you wish to take advantage of the special introductory price of 50 cents, postpaid.

Vocal Studies For Low Voice
By George Whelpton

The low voice demands specific material in the way of studies. Only the experienced teacher knows what these differences are. Teachers of voice will greet eagerly this book of systematic vocal exercises which will solve one of the serious problems of modern voice teaching. The advance of publication price is 30 cents, postpaid.

Advance of Publication Offers Withdrawn

Many readers of THE ETUDE fully understand the significance of the caption given this paragraph, but for the few uninformed, it might be well to review our policy upon new works. When a decision has been reached to publish a certain work we invariably announce it, accepting orders in advance of its publication at a very low price with the idea of introducing the work. These prices are below those at which we can afford regularly to sell the works, and, therefore, when they actually are on the market, the advance of publication prices are withdrawn. The works that are withdrawn this month are named below and briefly described. The retail prices are given and any responsible musician may now secure a copy of any or all of these works for examination.

We offered in advance of publication an *Album of Six-Hand Pieces by Sartorio.* This is now ready, and it is entitled *The Three Players.* It is a collection of six-hand pieces for the pianoforte composed, arranged and edited by A. Sartorio. There are eighteen excellent numbers which include several original compositions for six hands by A. Sartorio, and a fine variety of six-hand arrangements of compositions by some of the masters, and about half dozen contemporary writers. Teachers can utilize this album to excellent advantage in building up commencement programs with pupils in the medium grade. The retail price is $1.00.

There are four violin works withdrawn this month from advance of publication. Two are standard works, well known to violin teachers. They have been edited with great care by Thaddeus Rich, the well known concertmeister of the Philadelphia Symphony Orchestra. These works are *Scene de Ballet by de Beriot,* retail price 75 cents and *Concerto No. 1 in A Minor by Accolay,* retail price $1.00. Be sure to ask for the Presser edition of these works and you will get the superior editing of Mr. Rich.

Another standard work for the violin is Kayser Opus 20. We have produced a new edition of studies from Kayser Opus 20 that every violin student should know. This work is entitled *25 Selected Studies from H. E. Kayser for the Violin with Second Violin Accompaniment in Score, Opus 20, by Charles Levenson.* These are the best of the Opus 20 studies, presented in a logical arrangement, and a great feature of this work is the second violin accompaniment in score. The retail price is $1.00.

We are also withdrawing from advance of publication *Four Melodies for the Violin, by Frederick MacMurray.* The retail price of this is 75 cents. These four melodies are for the violin alone or with piano accompaniment. They will give the violinist something different, being written entirely in double stops, and proficient violinists can put new life into their repertoires with these four melodies.

Another withdrawal is *The Hymn of Praise, by Frederick Wick.* This is a cantata that can be used at practically any season of the year. There are soprano, tenor and baritone solos with choruses for mixed voices. About 40 minutes would be required for the rendition. The price is 60 cents a copy.

We have been offering in advance of publication, a short cantata for two-part treble voices entitled *In Foreign Lands, words and music by Richard Kieserling.* This is now withdrawn, and the price is 40 cents. Directors of music in college seminaries and schools for girls will be delighted with this work, which is also suitable for use by choruses of women's clubs.

The work offered in advance of publication as *Easy Opera Album* is now published, and the correct title is *Young Folks' Opera Gems.* The price of this excellent album is reasonable, being but 75 cents, retail. There are 27 excellent second and third grade arrangements of melodies from the operas in this collection and 17 different composers are represented by selections from 23 different operas.

Beware of Fraud Agents

We again remind our friends that we are in daily receipt of complaints from all over the country that good money has been paid for a year's subscription to THE ETUDE and no copies are delivered. Investigation almost invariably proves the subscriber to have been swindled. We cannot be responsible where money is paid by our ETUDE friends to strangers, no matter what their canvass may be or what plausible argument they put up. Do not pay any money to anyone unless he or she is personally known to you.

Premium Workers—Attention!

Splendid rewards are offered to our premium workers on the inside back cover of this issue. Read the announcements carefully. Hundreds of our friends have written to us expressing delight with merchandise sent in exchange for new ETUDE subscriptions. The premiums are well worth working for, are guaranteed by the manufacturers, and we also guarantee that each reward is standard merchandise sure to give satisfaction. Send post card for complete premium catalog.

nharmonic—A change in letter name, not in tone, as F sharp and G flat.
ermata—a pause over a note, indicated he sign 𝄐.
inale—the closing movement or part of mposition.
ine—the end of a composition.
orte—with much tone, Loud. Indicated f.
ortissimo—very loud.
ugue—A contrapuntal composition tten according to fixed rules, in which a ain theme is taken up by the different ts or voices in succession.
uoco—(con fuoco) with great anima- and spirit.

Letter Box

R JUNIOR ETUDE:

e have taken your musical books for three years and I wanted to write to you how much we enjoy them.

e live on a mountainous island where re is a beautiful harbor and a high ak." Looking down from the peak, one s that the harbor stretches very far and dotted with little islands. There are y tiny junks that surround the wharves I often wonder how the people can in these small junks.

e are having many typhoons, and one very severe. It damaged many things, ted up trees, sank ships, and blew up ses and also, the worst of it was, it many people up in the air, which was pitiful.

his letter is from a Chinese girl who ld very much like to receive letters. ften wonder how the American children write such good English. I am sure y will find lots of mistakes in mine.

From your friend,
NELLIE CHENALLOY,
4 Prospect Place,
Bonham Road.
Hong-Kong, China.

Maytime

MAY! And Springtime nearly over and nmer time almost here! Have you ac- nplished all the things that you intended do this season?

re you as far on in your music as you hoped to be at this time? If not, you w you have very little time left to catch

une will be a very busy month at school know, with "exams" and commence- nts and school entertainments; so, really, atever you want to do that you have done in your music must be crowded o May.

o work very hard in May while you still e an opportunity. Do not be afraid of king yourself too tired. (It is always the y people that have time to do things—the fers never attempt any thing.)

f you are getting lazy, get your battery charged" and take the grade on "high r."

hen you will have reason to feel pleased th yourself for making the effort, and for results that will not come without effort.

The Soil of Music

By Leonora Sill Ashton

HAVE any of you ever planted a seed, or a bulb, and watched it grow.

If so, you have had one of the finest lessons in the world right before your eyes.

But it is not of the seed, or the root, or the bulb, or the stem, or the leaves, or even of the flower itself, that this is about. This is about the *soil* in which the plant grows.

Now everybody knows that it is from the soil that a plant draws its life. Way down in the darkness, in some way we cannot explain, the roots are sending out their little fibers to draw in the strength and the nourishment which they need.

If the soil is dry and poor and there are stones in it, there is no food for the plant to live on; so it dies.

But if the soil is rich, and well watered, and cared for, the plant lives and blossoms, and puts forth leaves and flowers,

Now music is one of the lovely flowers that spring up and grow in the life of a girl or boy; but you know well enough it does not bloom for the asking.

Your music must have roots, and they must be deeply imbedded in something upon which they can feed.

I wonder who can guess what the soil is that the flower of music needs.

Its name is Technic.

Without this, all the love of music in the world, all the quick hearing and the fine sense of rhythm which many children possess will soon wither and die like a flower suspended in the air.

Those of you who live in the country or have been to the country in the summer have surely seen the fields and gardens and the farmers preparing the soil for the next planting.

They dig and hoe and rake and plough and harrow; or, perhaps, in a flower garden, they get down on their hands and knees, and with a trowel and their own hands pulverize the soil and rid it of stones so the roots of growing things will fit easily and well into their places.

Your soil, that is, your technic, the fitting of the muscles of the hands and fingers to hold the roots of the music as they should be held, needs care, too. And what are the implements we all own to do this work?

Here are some of our tools:
Finger gymnastics.
Five-finger exercises.
Scales.
Arpeggios.

Each one of these has a special use.

Finger gymnastics make the hands strong and flexible.

Five-finger exercises make the hands strong, too, and also independent, one of another.

Scales shape the hands over the keys, and, in time, make possible the runs like a string of pearls which everyone loves.

Arpeggios stretch the muscles between the fingers, and make the whole hand supple and agile.

What fine tools they are! We ought to love to use them, to make our soil smooth and rich and a fit spot for the flowers of our pieces to grow.

Then there is one other thing about this soil.

Of course, like every other piece of garden ground, there are things that grow very easily whether the soil is properly prepared or not—weeds.

In music, weeds are called Bad Habits.

There is scarcely any need to name them, but here are a few:
Wrong position of the elbow.
Wrong position of the hands.
Stiff wrists.
Awkward fingers.
Long fingernails.
Uncertain touch.

There would be almost no end, if we tried to remember them all.

And what do weeds do?
They crowd out the lovely flowers.
And what do the gardeners do?
They *root them out!*

Let us all be faithful gardeners. Let us watch carefully for the first sign of a bad habit and root it out before it has even a chance to grow and become strong.

Let us use the tools our teacher gives us in the way of exercises and scales to the best of our ability to make a firm, sure rich soil, and we will soon have a lovely garden spot where the sweet flowers of melody will abound.

A Good Time With the Organ

By Frances McCollin

Aunt Kathryn is the organist
In the church up on the square,
And often times she lets me go
To hear her practice there.

Of course I mustn't make a sound
Or talk to her at all;
I just sit quiet as can be
Up in a high choir stall.

And then when I am getting tired
I climb down from my perch,
And tiptoe softly round and see
The windows in the church.

Then in about an hour or so
She says, "Come, Edith dear,
And I will play you any tune
That you would like to hear."

And then I go and sit by her,
Up on the organ-seat,
And play a hymn tune with my hands
While she plays with her feet.

Then she plays lots of lovely things
From Fugues to big Tocatas,
Meditations, Nocturnes, Songs,
And beautiful Sonatas.

Aunt Kathryn is the organist
In the church up on the square;
But when I'm grown up I hope
I'll play the organ there.

Letter Box

DEAR JUNIOR ETUDE:

I am nine years old and in the fourth grade in school and in the third in music. For pets I have a cat and a dog. I get THE ETUDE every month and enjoy it very much, and I hope some little girl or boy will write to me.

From your friend,
CATHERINE MORTON (age 9),
Tozah, Ky.

DEAR JUNIOR ETUDE:

I have not been taking THE ETUDE long, but have always wanted to. I love to read the JUNIOR ETUDE and I like to study the music. I play the piano and also a mandolin. Last year my teacher gave me mandolin lessons for about five weeks and now I can play almost anything that I want to on it.

I wonder how many of you who read the JUNIOR ETUDE have ever played in church? I never have but wish I could. One Sunday I was playing one song, but the organist came while I was playing it, so I never got to play it.

Your friend,
GRACE NEALY (Age 13),
Mississippi.

N. B.—Lillian seems to think that everybody's ETUDE is mailed separately, but they are all mailed at the same time—thousands and thousands of them. Contributions for the contests keep coming into the office from all over the United States from the very first day of the month up to closing time, so it would seem that people even living at a distance, receive their ETUDE on time. Therefore, the trouble must be in your own postoffice, or some place on the way.

RECENTLY PUBLISHED TEACHING HELPS
Many Piano Teachers Already Are Using These Meritorious New Study Works With Excellent Results

ALBUM OF TRILLS
Special Study Pieces—Vol. 1 Price, 75c
The trill is a valuable technical device in piano playing and in place of coldly presented trill studies the teacher will find these pieces utilizing the trill hold the pupils' interest while effectively developing ability to handle trills in various forms. Eighteen pieces make up this album—about six different forms of the trill appearing in them. Pupils in the medium grade can be induced to accomplish much with this excellent study help.

FROM MY YOUTH
Twelve Character Pictures for Piano
By R. Krentzlin Price, 75c
Special attention is given in these pieces to the development of style, rhythm and technic, The first of these dozen pieces start in grade two with gradual progress in later numbers to grade three. One number brings out *Clinging Legato,* others *Light Velocity, Rhythm Groups, Rhythmic Accuracy, Staccato, Triplets, The Trill,* etc.

25 MELODIES FOR JUVENILES
By Mana-Zucca Price, 75c
Here one of the foremost woman composers of the day has written delightful little melodies for delighting young pianists. Starting with the most easy type of a piano piece the numbers progress in a nice, gradual manner. Clever texts that aid in holding the pupil's interest accompany many of these pieces.

FIRST GRADE BOOK
By Mathilde Bilbro Price, $1.00
A very attractive work for young beginners just above the kindergarten age. It introduces practically all necessary points, including the rudiments as far as necessary, hand position, notion, etc. The material is very attractive for little tots to study and both clefs are used from the start. Miss Bilbro's elementary teaching works are so very successful because throughout they display a practical knowledge of how to interest and instruct young pupils.

FIRST PIANO LESSONS AT HOME
By Anna Heuermann Hamilton
Book One, Price, $1.00 Book Two, Price, $1.00
This is a work for very young children and each part consists of a piano instruction book and a writing book. The writing books are fine notation and time aids and the piano books help in developing playing ability. At first the pupils have very easy one hand work with accompaniments by the teachers. The second book brings both hands playing together and introduces the bass clef. This is a sensible and practical arrangement of teaching material for little tots.

STORIES NOTES CAN TELL
By Frances Terry Price, 75c
These are charming early second grade piano pieces. They are characteristic numbers that delight young players. The key variety will interest many teachers since these six short easy pieces use the keys C, G, F, and A minor.

NEW PIANO COLLECTIONS
Useful Albums That Will Serve the Piano Student in Study or Diversion

YOUNG FOLKS' OPERA GEMS
Price, 75 cents
The aim in each of these numbers has been to present a playable piano solo in a fairly easy arrangement of an opera air, frills and variations having been avoided. There are seventeen composers and twenty-three operas represented in the twenty-seven selections in this album. Most of the numbers are in grades two and three.

CONTEMPORARY MARCH ALBUM
A Collection of Military, Parade and Grand Marches for all Occasions
Price, $1.00
Excellent material for the accompaniment of drills, marches, calisthenics and other gymnastic work. There are dignified march numbers covering other needs also included in the thirty numbers making up this album. All are effective march numbers of their individual types, yet all are within the ability of the average pianist.

ALBUM OF SIX COMPOSITIONS
In Modern Style
By Charles Huerter Price, $1.00
In this set of characteristic pieces for the piano, Mr. Huerter has handled melody, rhythm and harmony in a very original but satisfying manner. We recommend these pieces to concert pianists seeking novelties and to teachers desiring new material for pupils in about the fifth grade.

THE TWO PLAYERS
Thirty-three Four Hand Piano Pieces
Price, 75 cents
An exceptional variety of four hand entertainment material is found in this album. The pieces are in the intermediate grades and there are excellent arrangements of such favorites as *Song of India, Czardas, Don Juan Minuet* and a few others, but the major portion of the numbers are melodious numbers by well-liked contemporary composers.

TWO BOOKS EVERY MUSIC LOVER SHOULD READ
Musical Appreciation is Developed Through Pupils Reading Books Such as These

MUSICAL PROGRESS
By Henry T. Finck Price, $2.00
A series of practical discussions upon interesting matters in the "tone-world" of today, making informative and entertaining material for anyone interested in music. Beyond a doubt every student should read this book There has been no other musical literature work in recent years that has received so much favorable comment from critics and others high in the musical world.

SECRETS OF THE SUCCESS OF GREAT MUSICIANS
By Eugenio Pirani Price, $2.00
These inspirational life analyses cannot help but appeal to all who are interested in music and its makers, because the "success secrets" are surrounded with outlines of lives of the great musicians and enlivened by good stories having humorous or sentimental points which make the book readable and thoroughly enjoyable.

Junior Etude Contest

The Junior Etude will award three pretty prizes each month for the best and neatest original essay or story and for answers to puzzles.

Subject for essay or story this month, "melody." Must contain not over one hundred and fifty words. Any boy or girl may compete whether a subscriber or not.

All contributions must be received at the Junior Etude Office, 1712 Chestnut St., Philadelphia, Pa., before May 15. Names of prize winners and their contributions will be published in the July issue.

Put your name and age on upper left corner of paper, and address on upper right corner of paper. If your contribution takes more than one sheet of paper do this on each sheet.

Do not use typewriters.

Competitors who do not comply with ALL of the above conditions will not be considered.

About the Contest

Through an oversight, the closing date of the March contest was omitted, but everybody seemed to take it for granted that it would close on the tenth as usual, and most of the answers were received on time.

However, this month the contests will not close until the fifteenth, as so many, living far away, say they do not receive their Etude in time to have their answers in by the tenth. This delay, when it happens, must happen enroute, and there seems to be no reason for it, as many answers come in from the very farthest corners of the United States on time.

But for the benefit of these readers the contests will close this month on the fifteenth. The Etude, however, cannot possibly wait for these extra days, as it has to go to print on time itself, so the results of the contests cannot be announced until the third month after the contest, instead of the second month, as heretofore.

REGULAR PRACTICE
(Prize Winner)

In the study of music practice plays an important part. Those who intend to make music their profession must be very patient and not get discouraged easily, and above all they must practice regularly. Most teachers ask their pupils to practice one hour a day, but if the pupil sits down and keeps his eyes on the clock he could practice all day and it would do him no good. Pupils must learn to concentrate, in order to learn how to play correctly. Regular practice teaches one to hold the fingers correctly, and also teaches correct rhythm. Each lesson in music always relates to the one before. Therefore, if the pupil practices regularly and understands each lesson thoroughly, he will surely progress in the study of music.

Frances Tusfeld (Age 13),
South Dakota.

REGULAR PRACTICE
(Prize Winner)

My opinion as to the value of regular practice is that it is a great developer for the strengthening of the muscles of the fingers and wrists. Practice is very important in the study of music and should be made as interesting as possible. I think that one should practice at least an hour a day, and with a spirit of desire to learn something each time one sits down at the piano (or any instrument it may happen to be). Make every minute count; and learn to put "soul" into the music being practiced.

Louise Gees (Age 15)
Wisconsin.

REGULAR PRACTICE
(Prize Winner)

The saying that practice makes perfect is applied to nearly everything in life but is particularly applicable to music. Without practice there is little or no use in our taking lessons; for it is through constant practice that one becomes an accomplished musician. If we neglect the first steps toward becoming a musician we neglect all. Music is an expensive accomplishment; and, if we fail to make use of our time we have thrown away our money as well as many valuable hours. There i a time for practice, as there is for a other things, and to make the best use o this period is to put forth every effort t accomplish the assigned lesson thoroughl Therefore there should be regular prac tice hours to obtain the best results.

Polly Whitworth (Age 13),
Texas.

Honorable Mention for Compositions

Grace Levenhaupt, Virginia Dusenberr Edmund Lukaszewski, Richard Hawkin Evelyn Walmsley, Luella Rogers, Mami Pittman, Florence Sampson, Louise Hallo way, Pearl Gould, Freddie Jones, Glady Vera Northup, Lillie Mae Palmer, Gordo Reed, Verda Belle Jenson, Catherine Hen nessy, Amelia Moodie, Ida Schoepel, Ger aldine Salmon, Mary Hawkins, Meldon C Collins, Theodore Ochs, Asenath Clam Faye Wagner, Grace Allendorf, Enna Mit chell, Dorothy Ashe, Willard Dabas, Bea rice Wilson, Lou Ethel Bryant, Mary Sim son, Velma Donaldson, Ann Ellis, Bernic Gleason, Annie Lupton, Louise Mason, Inc Thompson, Vadis Gardner, Virginia Dr den, Naomi Henry, Dorothy Pearson, Mab Root.

Puzzle Corner

I am composed of sixteen letters.
My 13, 14, 8, is a close relative.
My 9, 10, 7, 6, means to consider.
My 11, 14, 12, 13, means privation.
My 16, 7, 10, 9, 3, 2, is something neede in sewing.
My 1, 4, 5, means to fasten.
My 1, 3, 2, 10, means to escape.
My 12, 15, 7, 9, a small, slight building
My whole is the name of a famo composer.

N. B. Answers must include all t words as well as the whole.

Prize Winners

Frances Jones (Age 13), Indiana; Pa Chouinard (Age 12), Illinois; Ma Frances Berghaus (Age 14), Arkansas

Honorable Mention for Puzzles

Elizabeth Vassail, Esther Meyer, Gra Levenhaupt, Louise Tachoir, Marie Wi liams, Madeleine Robinson, Alice Kalne Hilda Arnold, Kathryn Malsberger, Do othy Ashe, Theodore Ochs, Doris Masc Beatrice Wilson, Alleen Rogers, Sy via Broering, Marian Welch, Eleano Kutchka, Ann Ellis, Gladys Vera No thrup, Roy Williams, Edith McAda Marguerite Mary Kelly, Louise Nyctra

Letter Box List

Very nice letters have been received fr the following, but as they were not of s ficient general interest they will not printed.

Eleanor Morrow, Frances Bennett, Flore Watson, Emily Randolph, Dorothy Edwar Gurney Kennedy, Frank Ross, Marce Erkila, Ruth Cacek, Martha Lee, Annie E Wilson, Frances Waken, Claire McCra Roslyn Roth, Marie Sepion, Martha Andi Ruby Davis, Edith D. Lawson, Autie Whi Betty Ann Williams, Vera Southwell, Tes Ruhl, Luella Davis, Dorothy Huntsber Maurine Powell, Ruth Beckman, Elea Brophy, Inez Christianson, Henrietta Masters, Walter Schultz, Ruth a-Lee Ellst Doris A. Wilhite, Ruth Weathersby, Betti Rundio.

Dear Junior Etude:

I have grown to be so fond of The Etu that I can almost call it my best friend, a some of the things that I read in it are v helpful to me. I play about sixth gr music. Nowadays, it seems to me you do n find as many boys who play the piano as y do girls, and that makes me work all harder so I can boast for the boys!

From your friend,
Volney W. Smith (Age 14),
California

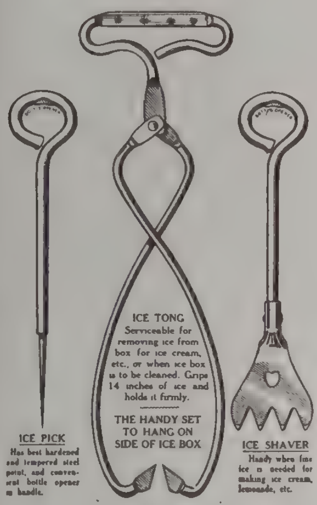
HANDY LEMONADE *and* ICE CREAM ICE SET

These three ice tools offer an exceptional value. Made of best quality steel, nickel plated.



ICE TONG
Serviceable for removing ice from box for ice cream, etc., or when ice box is to be cleaned. Gripe 14 inches of ice and holds it firmly.

THE HANDY SET TO HANG ON SIDE OF ICE BOX

ICE PICK
Has best hardened and tempered steel point, and convenient bottle opener in handle.

ICE SHAVER
Handy when fine ice is needed for making ice cream, lemonade, etc.

A Practical and Serviceable Set of Ice Tools for Every Home Need

Guaranteed to give Satisfaction

Indispensable for the housewife. **Only one new subscription.**

Any one of these splendid volumes for only ONE NEW subscription.

Music Masters—New and Old by Jas. Francis Cooke.

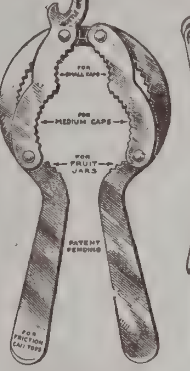
Celebrated Compositions by Famous Composers.

Celebrated Pieces in Easier Arrangements—a splendid album for pianists of average ability.

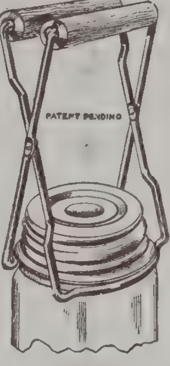
Remember only ONE NEW subscription secures ONE of these books.

The UNEEDA CANNING SET

Two New Kitchen Utensils



UNIVERSAL OPENER
For Large and Small Fruit Jars, Ketchup, Mustard or any Other Screw Top Container. Also for Friction Top Cans, Jelly Glass Tops, etc. Self-adjusting and Cannot get Out of Order.



WONDER JAR LIFTER
An Improved Device for lifting Fruit Jars from Hot Water. As Simple as it is Effective. Fits any Size Jar and Holds it Securely. The Wood Handles Prevent Burning of Hands.

Guaranteed to give Satisfaction

Only two new subscriptions.

Your choice of any one album below for TWO NEW subscriptions:

Standard Opera Album for Piano—melodies from the great operas. Intermediate grade.

Popular Recital Repertoire (31 pieces).

Program Pieces—a new recital album for the piano. A collection of real gems in grades 3 and 5.

TWO NEW subscriptions earns ONE of the albums.

UTILITY HOME FIVE PIECE KITCHEN SET

The Set Consists of:

Chopper—Useful for chopping vegetables and meat. Has ground cutting edge

Four-in-One Tool—This useful device may be used for removing the cap from milk bottles, as an ice pick, a crown bottle opener and for opening friction covers on cans.

Cake Turner—The pointed heart shape gets under griddle, potato or meat cake, without disturbing the one next to it. As an egg turner it has no equal. The curve in handle allows the blade to lie flat in the pan without raising the handle vertically. The handle may be used as a bottle opener

Handy Spoon—May be used for mixing spoon, vegetable spoon, egg separator, lifting eggs from boiling water, cream whip, strainer, cracked ice spoon, and for many other uses.

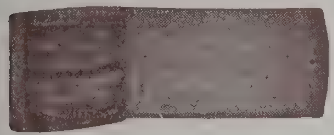
Fork—This every day necessity may be used for vegetables, meats, as a cream whip, for toast, etc

A PRACTICAL AND SERVICEABLE SET OF KITCHEN UTENSILS

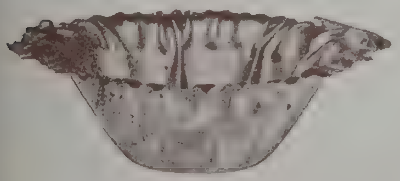
Guaranteed to give Satisfaction

A necessity in every household. **Only one new subscription.**

O'CEDAR MOP
Cleans and polishes. Your opportunity to secure a brand new outfit for **only two new subscriptions.**

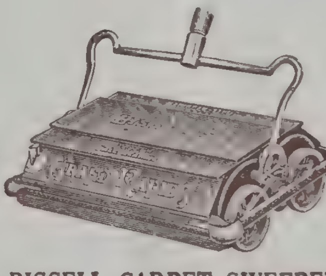


MILITARY HAIR BRUSHES
Prophylactic penetrator, size 4¾x2⅝ in black shark sheep skin case, **only four new subscriptions.**

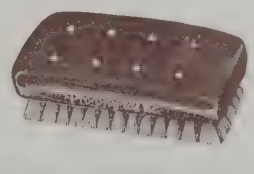


BONBON DISH
French grey silver finish, gold lined, **only two new subscriptions.**

A Camera for Boys and Girls
which takes and finishes a pictures in one minute. No films—no plates—no dark room. Image taken direct on sensitized card, size 3 1-2x2. This is a practical toy and will give great pleasure to the young folks, **only three new subscriptions.**



BISSELL CARPET SWEEPER
Ball Bearing, finest bristle brush, **only ten new subscriptions.**



PROPHYLACTIC HAND BRUSH
Solid black walnut, size 4½x2, **only one new subscription.**

HANDY NEEDLE OUTFIT
Contains everything in the way of needles; everyone's friend, bachelor or maid, **only one new subscription.**

BRUNSWICK brings to music-lovers a new conception of world's music. Now, in your home have the great singers of the day, the finest symphonies, the greatest instrumentalists. And artists of the vaudeville stage, with the popular modern music—dances, songs and syncopations.

Brunswick plays them all with a fidelity which only a musician can truly judge. The tonal quality of the notes, the exquisite definition of instruments, the shadings and color of voices—all expressed supremely.

The Brunswick Method of Reproduction is today conceded the premier place in phonographic music. It has removed Brunswick from the "talking machine" class and elevated it to the plane of higher music.

Ask your Brunswick dealer to play new Brunswick records for you. Hear selections of the New Hall of Fame. Hear the popular artists of Brunswick, the finest modern orchestras. They will give you a new appreciation of what Brunswick is doing constructively for greater musical knowledge, for the spread of the influence of good music everywhere.

The World of Music

A National Memorial Carillon is to be erected in Washington, at an expense of $3,000,000. It will contain the largest Carillon in the world, beginning with its heaviest bell of more than ten tons, tuned to E-flat and designated the "Bell of the Allies" in honor of the nations with which America was associated in the World War, and ascending the chromatic scale four and one-half octaves to an A-flat produced by its smallest bell, weighing less than twenty pounds. The bells will hang in a marble tower three hundred and fifty feet high and designed by Paul P. Cret, creator of the Pan-American Building and of the granite arch at Valley Forge.

"Kaddara," an Opera of the Esquimaux, by Borresen, recently had its first presentation in French, as a novelty of the season at the Théâtre de la Monnaie of Brussels. It is full of the folk-lore of Greenland, introducing dances, cries and songs of the primitive people. Borresen is a pupil of Svendsen; and his music, somewhat in the "Tannhäuser" style, is said to have much individuality.

The "Unfinished" Symphony of Schubert won by a large majority in a recent compilation of the lists suggested for a "Request" program of the Cincinnati Symphony Orchestra, which closed its season at Music Hall on Easter Sunday.

Twenty-two Thousand and Seven Hundred Dollars have been distributed in the last ten years by the National Federation of Music Clubs, as prizes to American composers; and this is but one of their activities in the encouragement and advancement of American music.

Giacomo Puccini, famous for his "La Boheme" and "Madama Butterfly," has been voted an honorary membership in the Facisti organization of Viareggio, Italy, near which his villa is situated.

Willem van Hoogstraten and Willem Mengelberg are again to be the conductors of the Philharmonic Society of New York. Henry Hadley is reappointed as assistant conductor; and Richard Aldrich will act in consultation on the selection of programs and the performance of new works.

The Army Band of Washington has been brought up to the full strength authorized by Congress. Its instrumentation, according to Captain Lewis, follows that of Le Garde Republicaine Band of France and makes The Army Band the only professional concert band in this country employing the entire family of brasses and woodwinds—including such rare instruments as the Fleugel Horns, English Horns (Cor. Anglaise), French Clarions and the Sarrussaphones.

Boston Music Week, May 4-10, was planned with the special objective of celebrating Boston's musical prestige and its claim as the "Cradle of Music in America." Many of the most significant events in American Musical History have occurred in Boston; and it was there that many of America's most beautiful hymns had their birth.

H. Konoye, a Japanese conductor, recently directed a successful concert of Western music, in Berlin. He has been asked to carry this project into his native land.

Madame Alice Vogrich, wife of Max Vogrich, so long active in New York musical life, and in her earlier years a leading opera and oratorio soprano of Australia, died in January at Melbourne where, since Mr. Vogrich's death, she had returned for residence and was a leading member of the teaching staff of the University Conservatorium.

W. J. Henderson, for many years music critic on the staff of the New York *Herald*, has been transferred to a similar position on the *Sun*, since the latter publication has come under the same management as the *Herald*.

The Francis Scott Key Memorial Bridge across the Potomac at Washington is to have a marble tablet placed at the Washington approach, by the Daughters of 1812, on which will appear the insignia of the society as well as the last stanza of "The Star-Spangled Banner." Special permission for this has been granted by Congress.

The Music Supervisors' National Conference held its annual convention in Cincinnati, April 7-11, with representatives from all parts of the country.

The Annual Messiah Festival of Lindsborg, Kansas, was held this year, April 13-20. Interspersed with other programs were three performances of the "Messiah," bringing the record up to one hundred and twenty-seven presentations of Handel's masterpiece by this enterprising college community.

"Der Freischütz" had a brilliant revival at the Metropolitan Opera in March, where it had not been given for fourteen years. For this occasion the conductor, Bodansky, had composed new recitatives to displace the spoken dialogue which had been used at former presentations.

Walter Damrosch is conducting a Beethoven Cycle at the Théâtre des Champs-Elysées of Paris, with the orchestra from the Paris Conservatoire.

London Radio Enthusiasts report that they heard clearly the farewell recital which Marcel Dupré gave on the Wanamaker Auditorium Organ of New York, on April 1st.

Gounod's "Faust" and Rossini's "Barber of Seville" are the two works most popular with Parisian audiences, according to box office reports of the Opéra and Opéra-Comique.

Harry T. Burleigh's Thirtieth Anniversary as baritone soloist of historic St. George's Church, of New York, was celebrated at a special service on the last Sunday of March. The service was largely musical, in which Mr. Burleigh's songs and settings of the "Negro Spirituals" had a prominent place.

Sir Henry Heyman, violinist, conductor, composer and teacher, died at Paso Robles, California, March 28. A native of Oakland, California, he was educated in the Conservatory of Leipsig where he won the Mendelssohn Prize and was afterwards for a number of years a first violinist of the Gewandhaus Orchestra.

A Pittsburgh Symphony Orchestra seems about to appear above the musical horizon. A campaign is now under way in "The Smoky City" for a two million dollar endowment fund to insure its permanency.

England's Musical Losses in the last days of March are irreparable. Sir Frederick Bridge, so long organist of Westminster Abbey, and one of the world's greatest authorities on the music of the ancients; and Sir Charles Villiers Stanford, eminent composer and teacher, received our tribute last month. To these was added Sir Walter Parratt, organist of St. George's Chapel Royal, Windsor, on the thirtieth of the month. Sir Walter Parratt was the dean of English organists, and had done much towards the establishment of British pre-eminence in this type of music. Famous as a Bach interpreter, he is said to have been able to play any one of the master's great organ compositions and to carry on a conversation or dictate the moves in a game of chess at the same time. Also, he was the favorite musician of Queen Victoria; and his passing might almost be said to close the Victorian Period of Music.

The Fourth Centenary of the Birth of Giovanni Pierluigi da Palestrina will be celebrated during the first six months of 1925 by the Royal Academy of Saint Cecilia of Rome.

Cesar Franck's "Symphony in D Minor" recently won for the third consecutive season the distinction of being the favorite "request" symphony number of the patrons of the Philadelphia Orchestra. Tchaikowski's Fifth and Sixth Symphonies won second and third place, with Beethoven's "Fifth" coming fourth. Beethoven's "Leonore," No. 3, won first place among overtures, over the "Tannhäuser," by four votes. Rimsky-Korsakoff's "Scheherazade" has for three seasons held first place among miscellaneous works.

Igor Stravinsky is considering a visit to America some time of the next season: so Dame Rumor whispers.

Mai Davis Smith, for two decades a leader in the Buffalo musical life, passed away on March 1st. She was perhaps the first woman in America to undertake the career of an impresaria.

The Leeds Choral Union, under the leadership of Dr. Henry Coward, recently gave a series of three performances at the Théâtre Champs-Elysées of Paris, by the invitation of the French Government. The Leeds Symphony Orchestra accompanied them; and Sir Edward Elgar's "Dream of Gerontius," with the composer conducting, was a leading feature.

Sleepy Hollow Tune (Vocal).. *R. Kountz* 410
My Old Home of Yesteryear (Vocal) *C. Smith* 412
Where Drowsy Waters Steal (Vocal) *Th. Lieurance* 413
A Summer Idyl (Organ) ... *R. M. Stults* 414

A Great Four Manual Organ is to be a feature of the Palace of the Legion of Honor presented by Adolph B. Spreckels to San Francisco to the memory of the California soldiers who enlisted in the World War. The organ is the gift of John D. Spreckels.

Twenty-Six Estey Organ Employees have been with the company forty years, while seven have been with the same firm for more than a half centry. A most remarkable record!

A Los Angeles Opera Company is reported to be in the process of organization. The plan under consideration is to work in collaboration with the organization at San Francisco, the two cities engaging the same roster of artists and arranging their seasons of performances accordingly.

William J. Stannard, ranking band leader of the American Army, has been awarded the baton of "Pershing's Own" band, in one of the most trying competitive tests ever conducted in the army. It is the ambition of the General and his staff to make this one of the finest organizations of its kind in the world.

Mary Garden, on April eighth, made application in New York for naturalization as an American citizen. The great singing-actress has become such an American "institution" that many will read this news with gentle surprise; but she was born in Aberdeen, Scotland, and brought to America when about five years of age.

Richard Strauss has had his contract as conductor of the Vienna Opera renewed for a period of five years.

Henry B. Roney celebrated in April the thirty-seventh year of his activities in Chicago musical circles. Coming into prominence by the wonderful boys' choir which he developed in Grace Episcopal Church his fame was enhanced by the discovery and training of Blatchford Kavanagh, probably the most sensational boy soprano which America has produced—Patti declaring, "He sings like an angel."

Emile S. Enoch has lately passed away in London. Born in France, he went to London in 1869 and founded the house of Enoch and Sons, which was the first in Great Britain to publish the classic works at popular prices. It also introduced into England many French compositions, especially those of Chaminade.

"Giovanni Gallurese," by Montemezzi; "Falstaff," by Verdi; "Pelléas et Mélisande," by Debussy; "Jenufa," by Preiss; "Rheingold" and "Götterdämmerung," by Wagner; are among the novelties and revivals for next season at the Metropolitan Opera of New York.

The Society of American Symphonic Conductors was organized in New York, late in March, with Walter Damrosch as chairman. The conductors of practically all our leading orchestras were in attendance.

Frances Densmore, so widely known for her expert knowledge of the American Indian music, has been added to the staff of the National Museum at Washington.

The Oldest Radio Enthusiast has been discovered in Connecticut. Mrs. Maria Horton Chappel, living in Seehonk, lately removed her headpiece long enough to celebrate her 109th birthday. She declares that radio has rejuvenated her.

Carl Edouarde has celebrated his tenth anniversary as conductor of the symphony orchestra of the Mark Strand Theater in New York. American by birth, he was educated at the Royal Conservatory of Leipsig. His first success was with the Carl Edouarde Band; and with the opening of the Mark Strand Theater ten years ago Mr. Edouarde introduced the idea of having in a moving picture theater an orchestra capable of doing symphonic works, and also of having special orchestral scores for the films. From this beginning have resulted many orchestras of symphonic proportions throughout the country, and a great improvement in American musical taste.

(*Continued on page 431*)

SUMMER MASTER SCHOOL

For Artists, Directors, Teachers and Advanced Students *June 30 to August 9 (Six Weeks)*

SUMMER FACULTY

Prof. Leopold Auer
Master Violin Instructor of the World

Herbert Witherspoon
Famous Singer and Teacher

William S. Brady
Celebrated Vocal Instructor

Richard Hageman
Noted Coach and Accompanist

Sergei Klibansky
Internationally Famous Vocal Teacher

Prof. Xaver Scharwenka
World's Greatest Piano Instructor

Percy Rector Stephens
Notable Teacher of Teachers

Graham Reed
Authority on Voice Production

Florence Hinkle
America's Foremost Soprano

Leon Sametini
Renowned Violinist and Teacher

Clarence Eddy
Dean of American Organists

Dr. Georg Schumann
Illustrious Composer and Theorist

And the Regular Faculty of Over 100 Artist-teachers

Remarkable Courses in—Public School Music, Lyceum and Chautauqua, Movie Picture Organ, Languages

Unexcelled Normal Courses in—Piano, Violin, Vocal, Expression and Dramatic Art

Remarkable Courses in—Expression and Dramatic Art, Musical Theory and Composition, Opera Coaching, Accompanying

FREE SCHOLARSHIPS Professor Auer, Professor Scharwenka, Mr. Witherspoon, Mr. Brady, Mr. Hageman, Mr. Klibansky, Mr. Stephens, Mme. Hinkle, Mr. Sametini and Mr. Eddy have each consented to award a Free Scholarship to the student who, after an open competitive examination, is found to *possess the greatest gift for playing or singing*. Free Scholarship Application Blank on Request.

TEACHERS' CERTIFICATES AND DEGREES

Teachers' Certificates and the Degrees of Bachelor of Music, Master of Music, Doctor of Music, Bachelor of Oratory and Master of Oratory will be conferred at the end of the summer session upon candidates who show sufficient knowledge and who take the required studies.

Full details in Summer Catalog. Complete summer catalog on request. Lesson periods should be engaged now.

Dormitory Accommodations *Fall Session Opens September 15* *Complete Catalog on Request*

CHICAGO MUSICAL COLLEGE

620 S. Michigan Ave., Chicago, Ill.

The Leading and Largest College of Music and Dramatic Art in America

FELIX BOROWSKI, President
CARL D. KINSEY, Manager

THE GLENN DILLARD GUNN

SCHOOL OF MUSIC AND DRAMATIC ART

INCORPORATED

Artists', Normal and Opera Classes

Summer Term

Nine, Six or Five Weeks—June 2 to August 2, 1924

LEE PATTISON
Famous American Pianist, associate of Guy Maier in two-piano recitals. Artists' classes.

ADOLF MUHLMANN
Distinguished Russian Baritone. Muhlmann Opera School, a department that prepares for the stage.

ERIC DE LAMARTER
Foremost American Organist; assistant conductor Chicago Symphony Orchestra.

GLENN DILLARD GUNN
Described by the late James Gibbon Huneker as "A Master Pedagogue of Chicago." Normal classes.

GUY HERBERT WOODARD
Celebrated American Violinist and Teacher.

SOPHIA SWANSTROM YOUNG
Eminent Teacher of Dramatic Art. Normal Classes.

Faculty of Forty Distinguished Teachers

Catalog upon request BERTHA PERRIGO, Registrar

LYCEUM ARTS CONSERVATORY

(INCORPORATED)

SUMMER SCHOOL

June 16-July 26 (Six Weeks)

ELIAS DAY, Director
Theodore Harrison, Director of Music

A superior faculty, teaching every branch of Music and Dramatic Art.

Classes of special interest to teachers, during summer session.

Principles of Dramatic Art and their proper use, including Story Telling, Art of the Monologue and Teaching Methods.

Play production with practical demonstrations on a stage completely equipped for actual working conditions.

Work taken during the summer will be credited on regular courses. Diplomas and Degrees.

Studios, Theatre and Dormitories in our own Building, ideally located in the heart of the North Side Art Center.

LYCEUM ARTS CONSERVATORY
Dept. R. S. 1160 No. Dearborn St., Chicago

SUMMER SESSION

For Professional Singers Who Wish To Get New Ideas.
For Beginners In Vocal Art Who Desire To Start Right.
For Teachers Of Voice Who Aim To Keep In Advance.

For Aspirants To The Stage Or Lyceum.
For Little Theatre Organizers and Directors.
For Amateurs Who Can Spend Summers Only In Study.
For Students Desiring Teachers Courses In Above Arts.

Our Own Miniature Theatre For Recitals And Productions.

Address, stating course of study desired.
MACLEAN COLLEGE OF MUSIC, DRAMATIC AND SPEECH ARTS
2835 South Michigan Boulevard, CHICAGO, Illinois

MACLEAN, DR. JUAN C. VOICE DEVELOPMENT TEACHER OF SINGING

NORMAL SUMMER COURSE—June 23rd-August 1st at Maclean College

AUTHOR OF THE AMERICAN METHOD OF VOICE DEVELOPMENT

INTERNATIONAL MUSICAL AND EDUCATIONAL AGENCY

MRS. BABCOCK

OFFERS Teaching Positions, Colleges, Conservatories, Schools. Also Church and Concert Engagements

CARNEGIE HALL, NEW YORK

Finest Conservatory in the West

SUMMER MASTER SCHOOL—

June 23 to August 2—Six Weeks

DETROIT CONSERVATORY OF MUSIC

50th Year

FRANCIS L. YORK, M. A., *Pres.* ELIZABETH JOHNSON, *Vice-Pres.*

OFFERS courses in **Piano, Voice, Violin, Cello, Organ, Theory, Public School Music and Drawing, Oral Interpretation, etc.** Work based on best modern and educational principles. Numerous Lectures, Concerts and Recitals throughout the year. Excellent Board Accommodations. Teachers' certificates, diplomas and degrees conferred. Many free advantages. We own our own building, located in the center of most cultural environment. Students may enter at any time.

For particulars of summer session and detailed information address

JAMES H. BELL, *Sec.*, Box 7, 5035 Woodward Ave., DETROIT, MICH.

THE ETUDE

JUNE, 1924 Single Copies 25 Cents VOL. XLII, No. 6

Securing Summer Musical Employment

Young musicians write us from all parts of the country, asking how they may get positions to play in the summer. They know that hundreds of summer hotels do have "music with meals" and otherwise; and they do know that countless students expect to piece out their study funds by playing in this manner. Good music played under such conditions is in no sense compromising to the player. Many of the world's finest performers have, in their youth, played in restaurants, hotels and small theaters.

We do not, however, have an agency or bureau or list to help these friends! Our only advice to them is to secure a list of resort hotels from a travel bureau or from a metropolitan newspaper and write to the hotels individually. It is perhaps a waste of time to try to get positions in the very big hotels, for the reason that these positions are often supplied by men such as Whiteman, Lopez, Davis and others, who make a specialty of introducing their own orchestras. In many of the smaller hotels the music is obtained by the management. It is needless to tell young women that great care should be taken to ascertain the nature of the hotel to which they apply for employment. Very few hotels are not thoroughly legitimate business enterprises.

Thousands of young musicians add to their incomes during the summer season by securing subscriptions for magazines. Subscription getting, if done with tact and courtesy, is never offensive and can become very profitable. We know of one man who, traveling alone, secured over forty thousand subscriptions to The Etude. Those who play acceptably can often do exceedingly well in selling a musical magazine. The Etude never makes any fabulous promises in this direction, as the success of the subscription getter depends entirely upon his ability, his personality, his smartness in finding out the musical folks in a town who ought to have The Etude, and his business ability in general. There is no reason why the summer should not bring you a very nice income in this way if you need the money, are really ambitious, become an *accredited* representative and are not afraid to hustle.

Unaccompanied Song

Herbert Bedford, painter, composer, critic, husband of that remarkably gifted genius, the late Liza Lehmann, has just issued from the Oxford University Press an "Essay upon Unaccompanied Song." He says:

"Let us realize at the outset that modern unaccompanied song is not merely the voice part of any accompanied song, robbed of its natural accompaniment—set to shiver on the concert platform stripped of its accustomed garment. It is, in fact, something musically different; it is composed with the deliberate intention in the mind of the composer of its single vocal line being complete in itself without the harmonic assistance or the commentary of an accompaniment—imagined, indeed, complete in the composer's mind, without one."

Mr. Bedford insists that unaccompanied song has no intimate connection with what we understand as "folk-songs." It is something quite different—an attempt to re-incarnate the monodia of the sixteenth century, or to transport the unaccompanied song of the Far East to the modern concert stage.

We like to feel that we are invariably in sympathy with beautiful iconoclasms, especially when sponsored by men of reknown and experience. To us, however, after a careful perusal of Mr. Bedford's delightfully written essay, we cannot but feel that unaccompanied song in this day and age is not unlike unaccompanied members of the human body. Why amputate the melody from the accompaniment?

To Jazz or Not to Jazz

Every now and then we read of some serious composer who announces that his forthcoming symphonic work will introduce some tricks he has learned from Jazz.

Meanwhile Jazz has flooded over the world like lava from the American volcano of popular music.

The Jazz problem has reached such dimensions that in August we shall let The Etude be a forum for the discussion of the pros and cons of Jazz. Many noted writers on both sides will participate.

In any event, we do know that the Jazz of ten years ago is not to be compared with that of today. Jazz has grown up, gone through high school and is ready for college.

Will it, nevertheless, still conceal under a cloak of culture the iniquity which so many people ascribed to Jazz?

To Jazz or Not to Jazz? Will Jazz injure really good music—the kind of music that The Etude has stood for during its forty years of progress and for which it will continue to stand?

The "Battle of Jazz" in the August Etude will be "some fight." Don't miss it.

Music Libraries in Your Community

Someone asked us a short time ago, "Where does the money go which composes the $2,000,000 a day, reported to be America's bill for music?"

It is not difficult to answer this question if one will note, for only a very little while, the really immense musical activity in all parts of the country.

Two years ago the *Department of Interior* published a booklet prepared by a Committee of the *Music Teachers' National Association*, of which Mr. William Benbow, of Buffalo, was the chairman. This committee made a survey of music departments of libraries in various States of the Union. The report is both encouraging and discouraging. It does indicate, however, that we are investing a great deal of money in musical books. In some parts of the country the investments have been very large and in others disappointing.

The largest music libraries are by no means always in the largest cities. In Pittsburgh, for instance, the Carnegie Library has 7,000 books on music, and 1,400 bound volumes of music, 175 orchestral scores, and 400 chamber music scores. According to the report quoted, the Free Library of Philadelphia has less than half this number of works in its collection.

The report given of the Library of Congress is indefinite in totals. It is therefore impossible, from the reports quoted, to give an accurate estimate of the quantity of books and pieces it contains. There were, in 1918, 822,000 volumes, pamphlets and pieces. There are probably 10,000 orchestral scores of operas, symphonies and concertos, and 5,000 chamber works. There are 1,000 autograph manuscripts of American composers. Up to the time of the report there had been approximately $150,000 spent upon the purchase of music and books, although the works acquired through copyright are valued at an equal amount, if indeed, their value is not even greater.

The Musical Library of Congress is a monument to the musical activity of America. Let us hope that it will not become a Mausoleum of Music in the sense that only a very few of the musically interested people may catch more than a glimpse of this noble collection. When you visit Washington, make it a point to spend a little time investigating the resources of your national musical library. The report states that nine attendants give their entire time to the collection.

There are doubtless more now; and you will unquestionably be welcomed, particularly if you go with some plan of study or research well mapped out.

The worth of a library, like the worth of a watch or of an automobile, depends upon how much it is used. Every teacher, every music lover, ought to possess a good working musical library of the best books and the best music. A safe way to judge the teacher's ability and thoroughness is by the care with which he has selected his books and the size of his collection. This is an infinitely better guide than a fancy show of art furniture, fine stationery and expensive advertising. If the books show signs of use, so much the better.

We once went into a public library where there were kept on file several issues of The Etude each month. The copies were literally torn to tatters, through constant use. It was in a neighborhood where many of the residents might have found the cost of even twenty-five cents for a copy of The Etude just a little more than they could afford. But those tattered copies indicated that in that district there were doubtless more real active music students than in any other part of the great city.

We have known of many libraries where the collections are entombed and guarded with a kind of grim death watch. You enter and are greeted at the door with an expression registering, "Why did you come? Why do you want to disturb us and our books? Why don't you go away and leave us to rest in peace?" We know of one huge stone mausoleum of books, costing hundreds of thousands of dollars, which is visited by only a handful of people a week.

The value of a library depends entirely upon how much it is used. A trunk full of books traveling around among country towns, bringing new life and inspiration to thousands, is worth far more than many collections of fabulous price, buried from civilization almost as securely as the treasures of King Tut.

My Precious Hands

"My precious hands!" exclaimed the excited de Pachmann, refusing to shake hands with a friend between the parts of a piano recital. Yet the writer has seen the seventy-five-year-old virtuoso forget those same precious hands and clasp the hands of a friend with a grip of steel.

How much should the pianist's hands be protected? Surely no one has a finer, cleaner, swifter or more delicate technic than Josef Hofmann. Yet, Hofmann builds automobiles for a pastime. It would seem that the powerful hand of the virtuoso pianist can stand a great deal of strain without any danger of injury.

In the case of the growing pupil there seems to be a really great danger. The boy who uses his hands like sledges or who employs them to receive the anvil-like blows of a flying baseball—the girl who plays hockey until her wrists ache—each has been the bugbear of teachers. The hand in youth will not stand abuse without paying the penalty. In mature years Mr. Hofmann may know how to use his wonderful hands so that they will not be injured.

There is, however, a great deal of poppycock about possible injury to the hands of students. We have had many young women write us to ask whether washing dishes did not injure the hands for piano playing. A fine juvenile overture for laziness. We have had (actually) three correspondents who have asked us whether milking a cow was bad for one's piano technic.

Reasonable care of the hands always pays. Indeed, that girl who by experience knows that some of the excellent lotions on the market, when combined with a little massage, keep the hands limber and free, often has a decided advantage over her male competitors who foolishly turn up their noses at such things.

"My precious hands!" De Pachmann may well call them precious when he realizes that they have again brought him a fortune, many years after the time when most men retire.

Self-study, like self-doctoring, may be dangerous unless done rightly. A stimulating article in the July Etude tells some of the right ways.

Wonderful Musical Advance in the Antipodes

Every once in a while our vanity is punctured by the news of some of the unusual achievements of Australia and New Zealand in the field of music. With a population only a fraction of that of the United States, they have conducted a musical activity relatively far greater than our own.

Australia is very largely Anglo-Saxon in its origin and still continues as one of the outposts of the Nordic race. The people are a fine, vigorous pioneer branch of our race. Now and then we are honored by a call from some of our valued friends crossing "the States" to England. They tell us almost invariably that Australia and the Australians resemble America and the Americans more than they do England and the English.

Australia supports a large number of most excellently trained teachers of music. It has its own finely printed musical papers, representing serious and enthusiastic interest in the art. In recent years it has greeted famous artists from all over the world; and they come back with glowing accounts of their receptions. Some years ago when John Philip Sousa toured the land with his band, the photographs sent back of the public receptions looked like a king's progress.

The general public knows of the attainments of Melba, of Percy Grainger and of Ernest Hutcheson. There are doubtless many other Australian and New England musicians with equal potentialities who will be revealed to us in the future. All honor to our musical friends, geographically twelve thousand miles away but musically our very fine neighbors.

The Influence of Music in the Home

Some one has started a prize contest somewhere dealing with the subject, "Music in the Home." We know this because many of our friends have asked us to write their essays for them upon the subject or to furnish them with material dealing with it. Where The Etude suspects it is being requested to answer examination questions or prepare material which should properly result from the researches of the writer, we draw the line.

The influence of music in the home, however, is so obvious that one hardly knows where to begin to dwell upon it. Starting with the lullaby and ending with "Abide with Me," that wonderful hymn which has ushered so many of our loved ones into another world, music is as needful in the home as bread or sunlight.

There is no member of the family who is not benefited by some kind of music in the home. Let it be the frivolous dance tunes of the young folks. What could give more cheer to their lives? Let it be the favorite instrument of the student, young or old. What dearer friend than a beloved violin or a splendid piano? Let it be a rousing "around the piano" sing. What is more wholesome?

Music is beauty in the home—living, breathing beauty. There can never be too much of it, whether it is home made or whether it comes to you through the phonograph, the player piano or the radio.

Recently we lunched with Anton Lang, the Christus of the Oberammergau Passion Play. His face was a study, a lesson and an inspiration. Through years of idealization of the beauties of the life of Christ, his countenance has taken on a wonderful charm like which one rarely sees in this material world. His thought, his actions, his whole being, his whole existence, have been to personify Christ. The beauty of a Christ life shines in his countenance.

One cannot be surrounded by beautiful things and not be influenced by them. Beauty in the home brings beauty into the soul of everyone in the home.

"The wonderful Russians! They take music as an avocation and produce marvels." In the July Etude there will be some very illuminating and helpful articles which tell how the Russian student has accomplished more as an amateur than many do as professionals. If American creative energy could be turned to music in similar manner the results might be amazing.

Fundamentals That Lead to Musicianly Pianoforte Playing

By *WALTER R. SPALDING, A.M.*

Professor of Music at Harvard University

So much is being written and spoken nowadays about pianoforte technic, management of the fingers, tone color and kindred themes, that it may be of interest and assistance to consider the pianoforte and pianoforte playing from another point of view—that of the musician. We are told, for example, that the human finger and the arm no longer suffice. A "gripping" tone on the pianoforte must come from the hips and there are even professional purveyors of the so-called "loin tone!" *Qui vivra verra.* The forearm, however, has not been relegated to the limbo as it is prominent in the "forearm technic"—a kind of scrubbing up and down the keys—which is necessary in playing modern "cluster harmonies." Speaking of cults, it is amusing to know that there is one for associating colors, not only with instruments and vocal sounds, but even with specific vowels. For instance, the vowel "o" should always be associated with red, and the vowel "i" with blue. It is worthy of record that some of the great authorities in color audition disagree radically in this definite assignment of vowel sound and color, disagreement which, as Philip Hale shrewdly remarks, "makes the judicious grieve."

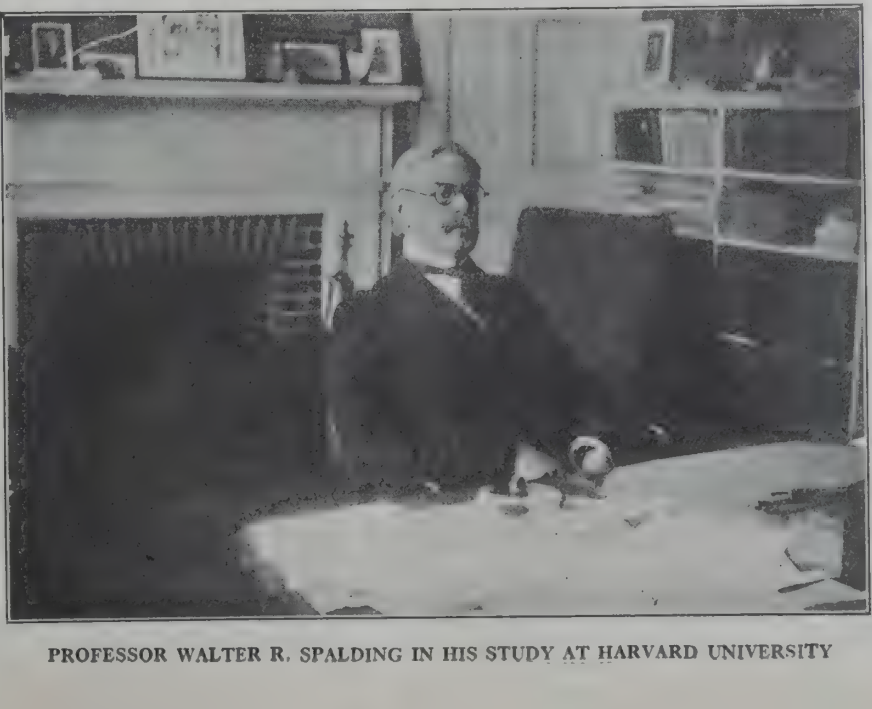
By way of general preface we may heartily acknowledge that technic and interpretation in their highest application are identical—two sides of the same shield—and it is also true that whatever tool is in consideration, be it jack-knife, a tennis racquet or a pianoforte, this tool should be employed with a realization of its possibilities and limitations and with the highest regard for good workmanship. It makes a difference, however, even with a jack-knife whether the user simply whittles shavings or carves out an interesting human figure.

We certainly today hear many young men and women play the pianoforte who yet do not play in a way which appeals to the mere musician. It is often painfully evident that they are so taken up with the management of their fingers, with carrying out some pianistic method in which they have been coached, that the broader and truly musical features in pianoforte playing go by the board—such as a beautiful singing tone a *cantábile legato,* tone color, shading and logical punctuation. Is it not time, frankly, to consider what is the real nature of the pianoforte with reference to its limitations and praiseworthy qualities, and what should be the aim in pianoforte playing? Then let us see if by making technic what it really is—a means to an end and not an end in itself—the standard of pianoforte playing cannot be raised. This point is more important than people generally realize, because the pianoforte has become the universal medium for the rendering of music—the chief domestic instrument—and anyone who plays it, be he composer, critic, singer, teacher or even potential virtuoso, should endeavor to play it in a really musical manner.

Pianists Not Forced to Listen

I should like to make certain suggestions which fall under three headings: First, an inquiry into the nature of the pianoforte; second, a consideration of the frequent confusion of means and ends in pianoforte playing; and, third, the effective relationship between the type of music played or performed in public and the musical equipment of the player. The first point which often strikes the musician is how few people in playing the pianoforte listen to themselves with reference to quality of tone, shading, color or balance of the hands. The reason is obvious—the pianoforte and the organ are the two chief instruments which can be played *without listening at all.*

With the voice, the violin, the clarinet, the horn, any of the orchestral instruments, the player is forced to listen to play in tune and to make any artistic or even acceptable effect whatsoever. But a person playing the pianoforte, if the instrument be a good one and in proper tune, can play away and make a certain amount of effect without really listening; and this is just what happens in many cases. To bring out, in fact, the possibilities of the pianoforte, the player must have ears in the ends of his fingers, not to play the instrument in tune as is the case with the violin, but to secure a warm singing tone and to take instinctive advantage of the many shades of color. All young players should strive for such a co-ordination between their brains, emotions and fingers. If they keep this standard clearly before them, a distinct gain will soon be noticed in the appeal which is made to a sensitive listener.



PROFESSOR WALTER R. SPALDING IN HIS STUDY AT HARVARD UNIVERSITY

Making the Piano Sing

The pianoforte, furthermore, is not, of itself, a singing instrument. Its legato, in comparison with the cantábile which can be produced by a voice, violin or clarinet, is only approximate. And yet the emotional appeal in any lyric melody depends on a legato style. A melody on the pianoforte must be sung so that it sounds as far as possible as it would sound on a violin. It is a well-known fact that some of the greatest pianists, Bauer, for example, have been fine violinists and apparently always play a melody with a violin legato in their minds. The mere term, pianoforte, itself contains a wealth of suggestion for those who will consider; for, although it is incapable of the sustained pianissimo of muted strings, the almost ghostly whisper of the clarinet, the fortissimo brilliance of a trumpet, or the overpowering volume of sound of the organ, the pianoforte has great dynamic range, if the relation of forte and piano can be taken into account; and there is no excuse for the dead level of dynamic effect which is so often apparent.

Furthermore, the pianoforte, with its numerous strings and with its large sounding board, is one of the most coloristic of instruments; and, except for very special effects where certain moments of dramatic austerity or intense grimness are desired, these waves of color should always be brought out by an artistic use of both pedals. The pedals, in fact, are not used nearly enough by the average performer; or it might be fairer to say that too much pedal is used, but in the wrong way. The *una corda* pedal, for example, not only has great coloristic possibilities, but also by its use the tone of the pianoforte is reduced by half; and when the instrument is played dynamically from pianissimo to fortissimo with the *una corda* pedal held down for long stretches, and then, in contrast, with the same dynamic gradations on all three strings, it is evident that from six to eight tints and demi-tints of color are at the disposal of the performer.

Beethoven's Attitude

As to the confusion between means and ends, let us attempt to answer the question, "What is the real end in playing the pianoforte?" Surely to bring out the meaning and the message of the music which the composer wishes to impress upon the listener. Also, but in a somewhat secondary way, to use the pianoforte as a beautiful tool as effectively as possible, but in no case to be so taken up with technical considerations that higher matters are lost sight of. Let us hear on this matter what Beethoven had to say, one of the greatest pianists, improvisers and composers for the instrument that the world has seen. His best pupil, Ries, records that Beethoven was "comparatively careless as to the right notes being played, but angry at once at any failure in expression or nuance, or in apprehension of the character of the piece, saying that the first might be an accident but that the other showed want of knowledge, or feeling or attention."

Ries also records that Beethoven's playing was not technically perfect, as he let many notes "fall under the table," but without marring the artistic effect of his performance. All who heard Beethoven are in agreement that in the sustained legato style his playing was unsurpassed. We also learn from Ries that Beethoven made liberal use of the pedals, much more frequently than is indicated in his compositions, and that he played the music *polyphonically,* that is, bringing out the meaning of the different voices. He insisted that the chief point in pianoforte playing was a singing tone; and all scampering over the keys without producing any depth of tone was dubbed "finger dancing" and "throwing the hands in the air." Liszt, also, the great modern virtuoso, is on record as saying that in many ways the pianoforte is a rather unmusical instrument, and if all the hearer gets is the impression of jangling wires, excited rapidity and unrelated noises, the efforts of the player do not amount to much more than keeping himself out of mischief.

Relation of Literature and Music

As to the third point—the relation between the type of literature and the technic and musicianship of the performer—I wish to make a strong plea for all young musicians, until they have a well-grounded technic and real musical insight, to play simple things and to play them well; that is, in a thoroughly musical and artistic fashion. The pianoforte literature of Schubert, Schumann, Mendelssohn, Brahms, Grieg, and even Debussy and Ravel, contains many fairly simple pieces within the reach of everyone. At present too many "musical murders" are committed in public. Let the young pianist play away in private to his heart's content on any literature which appeals to him, but let him not play in public, where others have meekly to listen, works which are far beyond him in musical content and the interpretative power to do them justice.

We must always, furthermore, bear in mind that of the reciprocal factors involved in the communication of music the player is active and the listener passive. The player is naturally having a good time; the music is perfectly clear to him and he is taken up with many considerations of technic, tone, and so on, which sustain his interest; but the poor listener out in the concert hall, waiving the few cases where he is perfectly familiar with the work being played and so makes up with his own imagination for any deficiencies, gets from the music simply what the player *presents* and *impresses upon him.* As a closing admonition, let it be said that if the player will make the message of the work being performed thoroughly his own, will listen to himself, produce a singing, well-graded and warmly-colored tone, he will always make an eloquent appeal to the expectant listener.

Self-Test Questions on Professor Spalding's Article

1. *What instruments can be played without attentive listening?*
2. *Is the piano a "singing instrument"?*
3. *What is the real end in pianoforte playing?*
4. *Was Beethoven's playing technically perfect?*
5. *How can one make an eloquent appeal in pianoforte playing?*

Misplaced Bars

By Eugene F. Marks

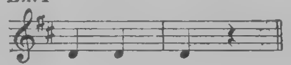
Every student knows, or should know, that in the final phrase of a period or movement, as a general rule, and especially in common time, the last tonic chord of the full cadence falls upon the first or accented beat of the last measure, and the preceding dominant or sub-dominant chord upon the last beat of the previous measure. However, in compound time (not the usual English or American acceptance of this term, which is applied to the triplet or dotted-note rhythm found in 6/8, 9/8 or 12/8 movements, but the German division by which 4/4 time is compound time, as it consists of two measures of 2/4 time thrown into one) we frequently find examples of the final tonic chord appearing upon the third beat of a measure.

The numerous instances of allowing the phrase to end upon the third beat in the measure instead of the first, found in the writings of the best composers, are usually due to the fact that the bars are put in the wrong place throughout the entire piece. No doubt this misplacement of bars arises only from inattention on the part of composers, as it makes no difference to the listener, provided the accent is correctly rendered by the performer, whether the cadence ends on the weak or on the strong beat; and the bar-division is only apparent to the eye of the performer.

Another rule (one of the strictest) as regards the interposed 6/4 chord is: When followed by another chord on the same bass note, the 6/4 chord must not be upon a weaker beat than this succeeding chord. In many cases of these misplaced bars we find that the interposed 6/4 chord is placed upon a weaker beat than the chord which follows it.

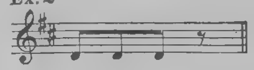
The polka. Listen how the third beat of the measure predominates over the first. As usually written, the polka is in reality 4/8 time (notwithstanding the 2/4 in the signature) which is compound common time (two measures thrown into one); therefore, the accent on the third beat is correct. This fact of the third beat of the measure in a polka being strongest proved the incentive for this article, through an endeavor to find the wherefore of this irregularity of accent. It is simply an accepted case of misplaced bars, which has been confirmed by the discovery of an old English example of a polka, which consists of sixteen measures to a period, instead of the usual eight, and which possesses throughout its entirety only two decided quarter beats to the measure instead of the usual four eighth note beats tc the measure. The ending was

Ex.1



instead of the usual

Ex.2



Besides the numerous examples of misplaced bars to be found easily by any student in the modern polka-form, a noticeable example may be discovered in Schubert's *impromptu, Op. 142, No. 3.* In the fifteenth measure, on the third beat occurs the interposed 6/4 chord to the final cadence. According to the invariable rule this chord should have a bar immediately before its appearance. The other cadences throughout the piece also fall on the third beat, instead of the first. If the piece had begun with a half measure the bars would have been placed correctly according to the demands of the true accentuation.

Likewise, in Chopin's *Nocturne, Op. 9, No. 2,* this defect is repeated. All its cadences end on the third beat instead of the first. This is so persistent that even the very last chord (which in nearly every piece falls upon the first beat, notwithstanding what has gone before) is written upon the third beat. But, what person, listening to the charms of such immortal writers as Schumann, Schubert or Chopin, would raise a raucity concerning misplaced bars? However, it is advisable that students know and appreciate the sound principles underlying the structure of our music.

"We cannot imagine a complete education of man without music."

—John Paul Richter.

"Nothing is too high for the young man of thirty to achieve, if he makes up his mind. The question is, will he pay the price?" —Lord Leverhulme.

Boston's Musical Past

In Boston:

The first music was printed in America, 1698.

The first book of Sacred Music was issued in America, *circa,* 1712.

The first Pipe Organ in New England was erected in King's Chapel, 1714.

The first Singing School in America was held, 1717.

The first Music Instruction Book in America was published, 1721.

The first Public Concert advertised in America, 1731.

The first Pipe Organ built in New England, 1745-6.

The first secular Sheet Music published in America, 1768.

The first Spinet built in America, 1769.

The first Singing Contest in America, held in Dorchester, 1790.

The first Orchestra in New England *The Philharmonic Society,* organized, 1810.

The first great Oratorio Society in America, *The Handel and Haydn Society,* organized, 1815.

The first complete performance in America of Handel's *Messiah,* 1818.

The first complete performance in America of Haydn's *Creation,* 1819.

The first singing anywhere of *My Country 'tis of Thee,* in Park Street Church, July 4, 1832.

The first large School of Music in America, *The Boston Academy of Music,* founded, 1833.

The first study of Music in the Public Schools of America, introduced by Lowell Mason, 1838.

The first performance in America of Mendelssohn's *Elijah,* 1840.

The first performance in America of Rossini's *Stabat Mater,* 1843.

The first performance in America of Handel's *Samson,* 1845.

The first performance in America of Handel's *Judas Maccabeus,* 1847.

The first American Chamber Music organization, the *Mendelssohn Quintette Club,* 1849.

The first performance in America of Beethoven's Overture *Leonore, No. 3,* 1850.

The first performance in America of Mozart's *Symphony in G minor,* 1850.

The first large Music Hall in America, 1852.

The first Music Journal of national circulation, founded by John S. Dwight, 1852 (now discontinued).

The first performance in America of Mendelssohn's *Hymn of Praise,* 1862.

The first great Concert Organ in America, opened in Music Hall, 1863.

The first great five-day Choral Festival in America, May, 1865.

The first great Music Jubilee in America, 1869.

The first large Oratorio written in America, John K. Paine's *St. Peter,* performed, 1874.

The first complete performance in America of Bach's *St. Matthew Passion,* 1879.

Walking for Teachers and Students

By Arthur G. Watson

American teachers and musicians do not seem to place proper importance upon the value of walking as a means of compensating for their long hours of sedentary labor. In Europe walking is taken as a matter of course. While I was studying with a famous European teacher of composition I found that his daily walks were as regular a part of his routine as his meals. He would no more have thought of missing that walk, which lasted not less than two hours, than he would of missing his dinner. As an active young American, accustomed to steady application to "the job," this amused me at the time. I pictured the American business or professional man taking two hours out of his day to wander around country roads. Now, however, when I compare what I have accomplished and what others who benefited by this man's training have accomplished, I realize that he was enabled to do vastly more because he kept his brains and body in better shape by walking. Perhaps we are not so smart as we think with our much-lauded application to business.

Bach, Beethoven, Wagner, the high lights in German music, were all inveterate walkers. During their lives they literally covered thousands of miles, just walking. Do they not present a great lesson to us?

Plan a daily tramp with some of your students, even though it is over hard city streets. The difference in your physical well-being in a year should be remarkable.

The Eisteddfod

By Rhodi Llewellyn

The Eisteddfod, as an institution of the song-loving Welsh, runs back into storied days purely traditional. These contests are known to have been practiced as early as the close of the Fourth Century, when Owain ap Maxen Wledig was elected to the chief sovereignty of the Britains upon the departure of the Romans. Since that time the Eisteddfod has flourished by royal edict and under distinguished patronage almost continuously.

The Eisteddfod is a national bardic congress of Wales. Its purpose is to encourage bardism, music, and the literature of the Welsh; to perpetuate the Welsh language and the customs of the country, and to cultivate a patriotic spirit among the people.

The term "Eisteddfod" itself means "a session" or "sitting," and probably was not applied to a bardic congress before the Twelfth Century. Since 1819 a National Eisteddfod has been held each year in Wales, alternating between the northern and southern parts of the country.

The first Eisteddfod of which there is a detailed account was held on the banks of the Conway in the Sixth Century. Maelgwn Gwynedd, Prince of North Wales, was the moving spirit of this event. In order to prove the superiority of song over instrumental music, he offered a reward to such bards and minstrels as should swim the Conway preparatory to the competition. On their arrival at the opposite shore the harpists found themselves unable to play because of the injury of their harpstrings by the water, while the bards were in as good tune as ever.

A provincial Eisteddfod usually lasts three or four days. It begins with a Gorsedd meeting opened with the sounding of trumpets and other ceremonies, at which candidates come forward and receive Bardic degrees. At subsequent meetings the president gives his address, bards follow with poetical addresses, and adjudications are made. Prizes and medals are given to the successful competitors for musical, poetical and prose compositions, for the best choral and solo singing, for the best playing on the harp and other stringed instruments, as well as for the best specimens of handicraft and art. The great day of the Eisteddfod is the "chair" day, the climax of which is the crowning or investiture in the "Bardic Chair" of the bard winning first place in the contest.

Through the initiative of our Welsh nationalists, Eisteddfods are now held at several points in America, at which the competitions are open to citizens of any ancestry.

How Much Do Appearances Count?

By Eleanor D. Crumbie

Probably because it is human to judge by appearances, St. John in the New Testament advises not to do so. "The dress does not make the monk," sings Rabelais; but nevertheless the world will have it that appearances do count. The musician is so dependent upon the public in so many ways that he should see that his visible impress is the very best he can possibly make it. Many musicians, conscious of their lack of physical charm, make no attempt to compensate for it by smartness of attire. They do not seem to realize that many of the most unattractive public figures of the day have deliberately sought a form of dress which makes them distinctive and "smart looking." The writer knows of at least a dozen musicians who present an utterly forlorn appearance, altogether unnecessary. Just a little intelligent tailoring, haberdashering and barbering would literally transform them.

If you feel that nature has not made you an Adonis don't imagine that the absence of physical charms can interfere with your ultimate success if your talents warrant their recognition. Remember the famous case of Joseph Haydn. The Prince Esterhazy was delighted with a symphony that Haydn wrote and forthwith employed him. When Haydn was first brought before the Prince at a court function the Magyar nobleman was shocked at first, and then was seized with a fit of violent laughter, exclaiming to the swarthy little musician:

"Is the music really by this blackamoor. Nevertheless, hence you belong to me. But I detest to see thee thus. Thy face is pathetic, thy body that of a gnome. In the name of goodness, put on a kapellmeister's costume; get thee new clothes, a new wig, a new red sash and red high heels, that thy height may correspond with thy talent."

What the Great Masters of Music Have Done for Little Folks

Famous Sets of Pieces Which Children Should Have an Opportunity to Learn

THAT the great masters realized the importance of writing good educational material is manifested in the number of excellent collections of teaching material coming from the pens of some of the very greatest men in the field of musical art. In fact, the inclination to write attractive pieces of a high type for little folks is in itself a mark of greatness.

Robert Louis Stevenson's "A Child's Garden of Verse" is regarded by many as his supreme achievement. Dickens was never clearer or more forceful than in his "Child's History of England." Charles Lamb's "Tales from Shakespeare" are among his greatest achievements. The greater part of the reputation of Joel Chandler Harris turns around his "Brer' Rabbit."

Not Easy to Write Children's Pieces

That many of the works of the masters focused upon children have been commercial successes is not surprising. The best publishers are eagerly trying to secure new and fresh material for children. The making of such compositions, so that they will be practical and yet not uninspired, is far from easy. We know of one publisher who offered a very substantial fee to a Europaen composer of the highest standing if he would attempt to reproduce in his own idiom the same ideals that Schumann had when he wrote his "Album for the Young." When the pieces arrived they were hopelessly poor. The publisher lived up to his contract and published them. They have never sold enough copies to pay for getting them out.

Kopylow's Little Masterpieces

The Russian composer, Kopylow, has in his "Musical Pictures for Children," Opus 52, come nearer to the Schumann ideal than almost any other composer. This delightful set in some ways surpasses Schumann as real pedagogical material. Gabriel Pierne also produced works of high character and real keyboard simplicity for children in his "Album for My Little Friends." A. Guilmant, the great French organist, wrote pieces for his own children, which have met with wide currency. Some of the most fascinating pieces by a highly skilled musician, E. Poldini, have been widely played. Amongst them is the delightful *General Boom-Boom.*

Debussy has written for children, as is told in the following article taken from the *London Times;* but his music is not the kind of melodies we usually associate with the child mind. Nor are they of the grade of difficulty which we associate with the little pink and white fingers of the child pupil. Nevertheless, this article is a most interesting and helpful one for the teacher in search of children's material and we quote it in full:

"Few recent piano compositions, even by professedly popular composers, can have attained the success of Debussy's 'Coin des Enfants' suite. Published only some two years ago, it has been the medium, throughout the whole musical world, of introducing Debussy to persons to whom the name was either altogether unknown or merely represented the unintelligibly vague in modern art. And yet it is highly probable that no hearers of the two finest numbers, *La Neige Danse* and *Le petit Berger* (isolated from those with specifically humorous titles), would realize that this exquisitely woven art was categorically intended first and above all for children; they would feel surprised (and, if seriously-minded, annoyed) at the discovery of the title-page, with its dedication to 'ma chère petite Charchou avec les tendres excuses de son père pour ce qui va suivre,' and its fascinating toy elephant of the purest Parisian breed.

"The children's corner in music has indeed been far too much left to the worthy second or third rate type of composer, who can turn out, with never-ceasing industry, work of which the best to be said is that it does not hamper the development of the appreciative faculty. Artistically, such influence is mainly negative, and we are thankful for slender mercies. Only a very few of the composers whose names stand for great achievements in art have consciously set themselves to form youthful ideals; and even they have not always been successful.

Where Mozart and Beethoven Failed

"Bach, Mendelssohn, Schumann, Tschaikowsky, Debussy: we can hardly add to these five any other name of similar eminence. Beethoven did indeed toss off a trifle or two for the amusement of children of friends; and the dusty corners of musical literature contain a small handful of similar totally forgetable and forgotten by-products from other august pens. Mozart and others of the older classics no doubt wrote a good deal merely for pupils; but they never seem to have had children specially in mind—all that they cared about was comparative technical easiness. The five named composers, however, produced, of set purpose, definite children's music; and it is perhaps not uninteresting to examine how they conceived the problem and with what success it was met.

"The 'Clavierbüchlein,' written by Bach for his eldest son Friedemann, contains, among its very numerous short pieces, many that were afterwards incorporated into 'Das wohltemperirte Clavier' and other familiar collections; and probably only a few of their players and hearers know that they were originally written exclusively for the benefit of a boy of nine. There is the *Prelude in C major*—far too often known now merely in bastard shape, all its delicate purity tarnished by the addition of Gounod's vulgar tune. There again is the great song-prelude in E flat minor, presumably for the cultivation of Friedemann's cantabile tone, as other preludes from the first book of the 'Forty-eight' (such as those in C minor, D major, or D minor) cultivated neatness of fingerwork. Exactness of part playing, expressiveness in various styles, rhythmical vivacity—all are represented by pieces familiar enough to us now simply as pure artistic inspirations; and yet, when once we are led to reflect on the matter, we can see how unerringly Bach achieved his special object.

"Many of his greatest organ works—the *G minor Fantasia,* the *F major Toccata,* and, indeed, most of those we know best—were written earlier, as were some of his most deeply felt cantatas, such as 'Gottes Zeit ist die allerbeste Zeit'; but of all this complexity and searching of soul there is not a trace. He succeeded indeed in doing, and doing perfectly, three very different things at once: the music is masterly in the mere pedagogic aspect, it can fascinate children (as teachers still know well enough) and can be played by them with real understanding, and yet it can still appeal, with no reservation whatever, to the mature brain and heart of the artistic veteran. This little 'Clavierbüchlein' shows, perhaps better than any other of his works, how Bach was able to see his art steadily and see it whole. Technic, emotion, intelligence—all are there; and to him the child is literally the father of the man, not a separate individual to be nourished on musical food that the grown performer will despise.

Stale Chocolate

"Mendelssohn's six 'Kinderstücke' (known in England by the apparently unauthorized title of 'Christmas Pieces') were the last works given by their composer to the world. But with all his experience as a lover of children and as a teacher, he failed to meet the problem as Bach had done. It is plain that he wishes to afford useful practice in particular problems, especially in the staccato touch in which he personally so much excelled; but there is little or nothing that makes any appeal to children now, and to the older of us the pieces, indistinguishable from the inferior specimens of the 'Lieder ohne Worte,' only suggest that Mendelssohn's genius was taking a holiday. We might confidently have hoped for some fine children's fairy or water music from the hand of the composer of the 'Midsummer Night's Dream' and the three great overtures inspired by river and sea. All that we get is, so to speak, stale chocolate.

"Schumann, again, failed in a different way. He wrote a large mass of compositions definitely for children's use, almost all with descriptive titles (often, however, concocted after the completion of the music). There are the forty-three pieces in the 'Album für die Jugend,' the thirteen 'Kinderscenen,' three complete sonatas, and several sets of duets of considerable dimensions. No one, as the perennially valuable aphorisms prefixed to the Album show, could have been more anxious about the deeper aspects of musical education; but his lack of experience and adaptability leads to strange results. He had an almost ludicrous ignorance of what a child finds technically easy or difficult. Even the section of the album specially marked 'für Kleinere' contains not a few passages that cannot sound approximately right except under the full-sized hands of a player with plenty of command over all the niceties of quickly varied touch and subtle pedaling.

"With a few familiar exceptions, not more than a dozen or so altogether, Schumann's children's music is forced and dull when really playable by children (as well as often when it is not). When it is in any degree characteristic of his genius, it is meant (whatever the title-page may say) exclusively for grown-up men and women who remember their own childhood with sympathy, but possess adult fingers and brains and hearts. What child has ever lived who could make anything but an emotional caricature of the '*Abendlied?*' We all acknowledge that the 'Kinderscenen' are among the most fascinating short piano pieces in existence, but in every way they insistently demand grown-up performance, and even *Am Springbrunnen,* where there are no difficulties of psychological expression, demands, from both fingers and feet, a skill far beyond that of any but the most exceptional children.

"The twenty-four pieces of Tschaikowsky's 'Jugendalbum' also have descriptive titles; but he again approached the problem differently. He never writes over the heads of children, either technically or emotionally; and some of the little pieces, such as *Pferdchen Spielen, Die Kranke Puppe, Wintermorgen,* are at one and the same time excellent practice and (so far as they go) daintily attractive music. But they certainly do not go very far, and no grown artist would deem them worthy of a second look. At their worst, they are feebly sentimental and useless from any point of view; at their best, they are written plainly with their composer's left hand. As with so many of his works on smaller canvas, his heart was not in his task.

Debussy's Technically too Difficult for Most Children

"Debussy, on the other hand, while writing only for technically advanced children, takes practically the same attitude as Bach, showing thus once again his distinct kinship with a far-off ancestry. The 'Coin des Enfants' suite no doubt requires adult performance to secure complete effect; but it can be played by children and still sound perfectly natural and right. There is nothing emotionally out of a child's range; the pages are full of childlike naive humor, childlike wistful imagination. And the six pieces, one and all, still appeal in fullest measure to older folks. The delicate parody of Clementi in '*Doctor Gradus ad Parnassum,*' the quaint slumberous noises of the *Berceuse des éléphants,* the gay irrelevance of the *Sérénade à la poupée* the 'grande émotion' and dainty burlesques of the *Golliwoggs' Cake Walk* (a title apparently untranslatable into French), all these are true children's music, but at the same time full to the brim with subtle details that afford perpetual delight to others. *Le Petit Berger* and *La Neige Danse* are indeed, for picturesque polished charm, unsurpassed in all modern pianoforte music; the latter, as a mere tone-picture (quite apart from its haunting melody), is an amazing *tour de force.* Except that there is no clear insistence on technical considerations, Debussy, alone of all later composers, is here a follower of Bach; he writes his music so that children can understand and interpret, but, unless we consent to be ossified by age, we need never outgrow it.

"Why should he be the only follower among the great instrumental composers? We can perhaps hardly expect that any one with all the elaborate technic of twentieth century composition at his call should be able to divert his ideas into channels of the extreme technical simplicity possible two hundred years ago; for our very easiest fine child-music we may have to keep to Bach alone. The 'great morning of the world' is gone; our ideas seem bare and thin when reduced to the naked minimum that amply sufficed for Bach. But still, even in these latter days, Debussy has shown that it is possible to write music far easier technically than his normal products, and intellectually and emotionally quite interpretable by children, without losing the least essential quality of style. What would the literature of child-art not have been, had all great composers been similarly gifted? There is no department of music that more earnestly, and now more than ever, demands enlargement."

The ability to write fascinating pieces for children which at the same time have some educational value seems to be a gift. Because a man can write a great symphony is no reason that he should be expected to write a fine "piecelet" for some eager little kiddie just testing his musical wings. On the other hand, it is also true that because the composer has not the writing technic to compose pieces in large form is no reason for assuming that he can not write delightful pieces for children.

The late Hans Englemann, as well as the late George L. Spaulding, were by no means "great" composers;

but they did write exceedingly fascinating and well turned pieces for children which have had immense sales. Practical teachers who have to do with the very practical problem of making a living from music by seeing their pupils progress and keeping them interested will probably go on indefinitely using the material from which they can get real results. For such a teacher a list like the following is invaluable.

C. Bolck, "12 Tone Pieces, Op. 58."
L. A. Bugbee, "Merry Rhymes for Childhood Times," with words; "Musical Thoughts for Little Tots," with words.
Mary Gail Clark, "On the Street."
H. L. Cramm, "New Rhymes and Tunes for Little Pianists, Op. 20," with words.
"Pleasant Pastimes for young Players, Op. 22," with words.
Easy Engelmann Album.
C. Gurlitt, Op. 101, "Album Leaves for the Young;" Album of selected Compositions (Mathews).
Geo, E. Hamer, "Juvenile Tone Stories," 6 Characteristic pieces "Old Rhymes with New Tunes."
F. F. Harker, "6 Forest Sketches, Op. 21," Easy.
C. W. Krogmann, "10 Five Note Recreations Op. 110."
Carl Reinecke, "Juvenile Album."
H. Reinhold, "24 Minatures, Op. 39."
Jas. H. Rogers, "Four Favorites after Mother Goose Miniatures," short pieces in etude form. "Toy Shop Sketches."
Geo. I. Spaulding, "Tunes and Rhymes," with words.
Newton Swift, "Story Time and Play Time."
Frances Terry, "The Little Artist."
P. Tschaikowsky, "Album for the young, Op. 39," "Album of Compositions."
Bach, "Little Fugues," "Little Preludes," "Little Preludes and Fugues."
Beethoven, "Easier Pianoforte Compositions," "Selections from Piano Works."
Handel, "12 Easy Pieces."
Mrs. Crosby Adams, "Tone Sketches."
Jessie L. Gaynor, "Miniature Melodies."
L. E. Orth, "Easy Pieces in Easy Keys."
Diller and Quayle, "Solo Books."
C. W. Krogmann, "Zephyrs from Melody Land."
M. Bilbro, "Happy Half Hours."
Frank Lynnes, "A Pleasant Beginning."

Starvation Methods for Students

By L. D. Whitney

Not so very long ago it seemed to be generally accepted that success in any branch of art was necessarily founded on a youth of tribulation and starvation. Unless the student had to fight privation in various forms he could hardly hope for ultimate success. It is true that deprivation and even starvation may prove a whip to indolent talents; but they are by no means essential.

Mr. Henry T. Finck quotes a letter from Edward Macdowell in Paris, who wrote of the students: "Most of them looked as though they had been up ever since they were born. They seem to live on cigarettes, odd carafons of wine and an occasional shave." It might be well to inquire how this deprivation resulted. Did it invariably produce Monets, Rodins, Debussys or Flauberts? If starvation produced genius in Paris, the world would have been flooded with it. The writer remembers his visits to the garret ateliers of many artists and musicians twenty or more years ago. Cheese, claret, bread and a trifle of meat were their regular diet; but in some mysterious manner none of these viands, although taken in homœopathic doses, have turned them into world-renowned artists.

In the work-a-day world of America students are properly seeking first of all the food and surroundings which lead to strong, vigorous, wholesome, good health. Richard Strauss has never known a day of privation or hunger, yet no one would dispute either his technic, his industry or his genius. Mendelssohn lived frugally amid plenty and produced enormously.

"Make pauses for breathing. What you cannot speak in one breath, you cannot play in one breath."

—Hans von Bülow.

"To my mind national music implies but imitation. A composer in one country writes a big musical hit. Straightway his form, and even his material, is copied, and hence arises the idea that the particular style is native to a certain country. The so-called Irish songs are little more than a parody of a very limited few bars of Irish jingle."

—John Philip Sousa.

Counterfeits in Musical History

There is an atmosphere of Romance in musical history that seems to breed spurious tales. Starting with St. Cecilia around whom many legends of questionable truth have arisen, there has been a tendency to create fables or fanciful stories about most of the great composers. In the present day the modern press agent has been responsible for most of these. Once started a false statement is repeated so often that it sometimes becomes almost impossible to destroy. Lt. Comm. John Philip Sousa for years has been trying to contradict the fiction that his name is really that of an Italian musician who joined a Marine Band under the name of John Philipso, adding the initials U. S. A. and later uniting them under the title of So. U. S. A. Nothing he can do seems to be able to convince some of the skeptical that his old family name of Sousa (sometimes spelled Souza) is one of the most distinguished in the land of his father, Portugal, or that he was born in Washington of a Bavarian mother.

A writer in the Chicago Record-Herald endeavored some time ago to destroy some of the musical myths which, alas, are very dear to many romantic music-hungry souls.

The main element that breeds false musical history is the attaching of spurious tales to certain compositions to enhance their interest. This narrative style has led many semi-musical auditors to crave a story with almost every musical composition. The foundation of many false tales is the descriptive names, not intended by the composer, which are attached to many important musical works. The "Moonlight Sonata," the "Sonata Apassionata," the "Emperor Concerto," the "Jupiter Symphony," and so forth, do not come from Beethoven or Mozart, however well they fit the compositions to which they are applied.

"The spurious story in regard to Beethoven's *Sonata, Op. 27, No. 2,* is something that should grieve every thinking musician. That the great composer found a piano and a blind girl in the woods near Vienna, and that he improvised a sonata is such a farrago of nonsense that it cannot be too emphatically contradicted. This particular musical work has its interesting story, but it is quite different from the silly romance above indicated. It may have been a musical love letter to the Countess Giulia Guicciardi, possibly even a farewell to her. Her name appears on the first edition, and it is dedicated to her. The mysterious and oftentimes intense love letters of Beethoven, which were found in his desk after his death, probably have reference to his passion in this regard. It is supposed that the first movement represents his yearning and the finale his passion for the beautiful Giulia. It is entirely probable that Beethoven crystallized his somewhat wandering affections into music, and in the case of Countess Guicciardi his devotion was deep and true.

Beethoven's Last

"Beethoven has suffered also from wrongfully ascribed compositions. The beautiful and tender little waltz called 'Sensuchtwalzer' was not written by Beethoven, but by Schubert. The little album leaf which has been called 'Beethoven's Farewell to the Pianoforte' is his own, but was by no neans his farewell to the instrument which he has glorified. In some editions this work is labeled 'Beethoven's Last Composition.' This is untrue, for his last (incomplete musical thought was part of a string quintet, which he hoped to finish, although very ill.

"This beautiful and expressive 'Pieta Signore' (Stradella's Prayer) is said to have saved the life of its composer. Stradella had fallen in love with an aristocratic lady in Rome and she returned his affection. The high-born brother, fearing the disgrace of his family, hired two bravos (professional murderers) to assassinate Stradella as soon as possible. The assassins proceeded to the church where Stradella was that day to sing one of his own compositions. They intended to slay him as he left the church; but they were so moved by the tenderness of the song that when he appeared on the street they not only warned him of the plot, but gave him money to escape to Rome.

"In the first place the incident never occurred; and, secondly, 'Pieta Signore' is not one of Stradella's compositions. It is supposed to have been written by Gluck, but although it bears some evidence of the characteristics of this composer, the certainty of its origin is doubtful, and 'Stradella's Prayer' will probably always remain an anonymous work.

"There is another story of a famous musical work which will serve to show how easily false history can be made when desired. Hector Berlioz, the great founder of program music, was cordially disliked by many of the musical critics in Paris. His scathing sarcasm, his boldness, and his extreme demands in orchestral matters, made him many enemies who attacked his music, root and branch.

"About this time Berlioz discovered an old musical score by an unknown composer. Berlioz transcribed it and wrote it in modern form. He announced this to all Paris. When it was publicly given, in Berlioz's transcription, the critics found traces of Berlioz in some of the numbers; they discovered medieval music in its best state, and a few even hinted that if Berlioz could write something like that he might indeed have hopes of eventually becoming a composer.

"Then came the sweet revenge. He explained that there was no medieval manuscript; there was no 'musical discovery'; he had written every note himself, and he was greatly obliged to the critics who had at last given him hearty praise.

"Many a musician has gone into ecstasies over Mozart's Twelfth Mass and the *Gloria* in this has been spoken of as an excellent example of Mozart's power. But it is highly probable according to some critics that Mozart never wrote a note of it. It is one of the most doubtful works in the music catalog, and was perhaps made up of various excerpts from unknown sources.

Schumann's "Warum"

"Perhaps the most far-fetched story that has been given to a musical composition is the one which is too frequently narrated in regard to Schumann's *Warum* (*Why*). Schumann was deeply in love with Clara Wieck, and the father of Clara vehemently opposed the marriage while Clara herself devotedly returned Schumann's affections.

"Starting with this, the story-teller states that after long separation the young lover wrote this tender question on a sheet of music paper and sent it to his Clara. She read it over and knew at once its purpose. 'Why must we suffer?' 'Why must we be apart?' She wept over the manuscript and then took it to her stern parent who was also melted to tears and sent at once for Schumann and said, 'Bless you my children!'—and they lived happily ever afterward.

"This is all very pretty, but as a matter of fact it is all false. In 1837 Schumann was much attracted by a young Scottish pianist, Robena Anna Laidlaw. They became close friends and exchanged much mutual sympathy. It is said that he suggested that 'Anna Robena,' would sound better than 'Robena Anna,' and further suggested changing the order of her name, which she did.

"There was high respect on the one side and admiration on the other in this friendship. The lady afterward married, and it was to her that the set of 'Piano Pieces,' of which 'Warum' in No. 3, was dedicated. Schumann won his Clara in 1840. He won her by a lawsuit in which he proved that he was of good reputation, had a reasonable income, that both the lovers were of legal age, and that there was no valid ground for her father to oppose the marriage.

"The beautiful story of the deep devotion of this famous pair needs no bolstering by a fictitious and tear-stained *Warum.*"

The Easiest Way

By Harlan W. Powers

Self-help students are often deceived by proverbs that have no basis in fact. In my teaching I have often met young men who have struggled along without a teacher who have listened to the dictum.

"The easiest way is the best way."

This should be corrected into, "The way that appears the easiest is the best way." The trouble with many a self-help student is that he permits his initiative to run away with his powers of controlling and concentrating his mind upon real hard work. In piano playing there are certain things that come only from keyboard work. Smoothness in arpeggios is the result of careful preparation of the thumb in passing over and under. You can think how to do it in the right way, but all the thinking in the world will not take the place of the gruelling practice necessary. Polish comes through polishing. The polish on your piano did not come from the first coat of varnish. Piano finishers gave it many coats, and between each coat they "rubbed" it down with their bare hands and pumice and water. Finally it looks like glass. If it had been left with the first coat of varnish it would have lost its lustre in a few months.

A certain amount of practice has to be accepted. It is like the torture of the olden days. The reason that torture was instituted was the mistaken idea that one's sins would be removed by it. It was done with exalted motives in the dark ages. The grind of practice is often torture, but out of that torture marvelous beauty may come.

Episodes in the Life of a Famous Conductor

Pen Pictures from the Autobiography of Walter Damrosch, Conductor of the New York Symphony Orchestra

Of the somewhat unusual number of interesting autobiographies of famous musicians that have appeared during the past few years, that of Walter Damrosch is one of the most fascinating and valuable from the standpoint of contemporary musical history. Doctor Damrosch has been so actively with us for the last half century that we have not, perhaps, realized the enormous undertakings in which he has been interested and the great work he has been able to achieve. His "My Musical Life," a handsome, illustrated volume of some 370 pages, is alive from cover to cover with pictures of things musical, as he has seen them, and who has had a better opportunity here and abroad to view the procession of musical events than this conductor—born in the very arms of music and intensely engaged with the art, literally every day of his life. We are indebted to Charles Scribner's Sons, Publishers, for permission to reprint the folloing extracts from his work, which many ETUDE *readers will surely enjoy in its entirety. Some 200 references are made to great men and women Mr. Damrosch has known in his busy life.*

Liszt's Crowd of Sycophants

I attended the audition in Liszt's rooms that afternoon and found that there was indeed a pitiful crowd of sycophants and incompetents assembled, but there were a few exceptions, notably young Eugene d'Albert who was then perhaps fifteen or sixteen years of age and who played wonderfully and to Liszt's great satisfaction. There were a few others who, however, did not play on that afternoon. But another one, who shall be nameless, sat down to play the Beethoven sonata in E flat and botched the introduction so horribly that Liszt gently pushed her off the chair and sat down himself saying, "This is the way it should be played," and then the music seemed to just drop from his fingers onto the piano keys, and such a heavenly succession of sounds ravished my ear that I did not think it possible human hands could evoke it. He then said to her: "Now, try it again." And she did, and, if anything, played even worse than before. Again Liszt played the opening phrases, and then, somewhat irritated, he said:

"So, blamieren Sie sich noch einmal." (Now, make a fool of yourself again.) By that time to our relief she felt that both she and we had had enough.

After this I met Liszt several times and he always treated me with uniform cordiality, but every once in a while the memory of our first meeting would come to him and he would make some gently malicious remark, such as "Oh, here comes our young American; like lightning he flashes through the world!"

A Wagnerian Tragedy

A tragic but rather amusing occurrence in Pittsburgh should here be recorded. The Damrosch Opera Company was playing a week there at the Alvin Theater. On the night in question we were to give "Götterdammerung" with Lilli Lehmann as *Brunhilde.* All was well. No singers had sent ominous messages of illness during the day, and I had just sat down to a quiet dinner at the Duquesne Club, previous to the performance, when a telephone summoned me. It was my wardrobe mistress, Frau Engelhardt, an excellent woman, devoted to her work, who had been at the Metropolitan in the old German Opera days and who had been with me ever since the founding of the Damrosch Opera Company.

Frau Engelhardt in greatest agitation begged me to come immediately to Madame Lehmann's dressing-room, where the "something dreadful had happened."

I knocked at her door and heard a tragic and hollow voice call "come in," and as I opened the door a sight indeed terrible met my astonished gaze. There stood Lilli Lehmann, already apparelled in her white *Brunhilde* garb, but covered from head to foot with soot, so black that she seemed more fit for a minstrel show than a Wagner music-drama. Her face was covered with black streaks, especially where her tears had made long and terrible furrows down her cheeks. I could not imagine what had happened, and only gradually and between hysterical bursts of tears, I learned that Lilli, according to her custom, had gone to the theater hours before the performance and had proceeded to dress herself, only looking into the glass at the last moment to prepare her make-up. She had then discovered the terrible condition of her face and costume. It seemed that the janitor had given the heater in the cellar a special raking which had sent tons of this dreadful Pittsburgh soft-coal soot flying through the registers and into the dressing-rooms where it settled like a pall on everything within reach.

WALTER DAMROSCH AT THE KEYBOARD

Outside the dressing-room I found my faithful Hans, son of my prompter, Goettich. I gave him some money and told him to run to a florist and buy a bunch of the whitest flowers that he could find and to bring them to Madame Lehmann with my compliments.

When I got back to the theater just before the performance, I found Lilli already on the stage, newly attired in clean white robes, but as she turned toward me I could still discern darkish streaks beneath the make-up of her cheeks, and in her sombre, dramatic voice she said: "Walter, I thank you for the lovely white flowers, but they will never, never wash me clean again." Her singing that night seemed to me more glorious than ever.

A Grewsome Tea-Party

One morning Bülow announced to me that he was going to cross the river in the afternoon to visit the widow of an old friend of his, Madame B——, who lived in a villa in Deutz. He asked me to accompany him, and we accordingly called on a rather attractive young widow, attired in the deepest mourning, who welcomed us very graciously. Her husband, a Belgian pianist of distinction, had been professor of piano at the Imperial Conservatory in St. Petersburg and had there married a young Russian pupil of his.

After chatting awhile, she proposed that we go into the garden for a cup of tea, and we followed her, accordingly, to a small stone building in the middle of the garden that looked like a chapel, but which, to my horror, I discovered, as we entered, to be a mausoleum. In the center stood a sarcophagus on the top of which reposed a coffin, with a glass top, in which lay the body of B——! A footman in livery followed us with a samovar and the teacups.

It seems that the lady had thus endeavored to demonstrate her love for her departed husband. I confess that I became almost ill and hurriedly left the mausoleum to smell the roses in the garden, but Bülow punctiliously and courageously stuck it out and had his cup of tea under these unique conditions.

Her Credentials

Marianne Brandt had a delightful sense of humor, but also a very quick temper, and I remember her telling me one day that she had received a notice from the New York Post-Office Department that a registered letter was awaiting her down in the General Post-Office at City Hall. She went there and inquired at the proper window for her letter.

"Yes," said the official, "we have it here. Have you got some document to prove that you are Marianne Brandt?—a letter, a bank-book, or a passport?"

"I have none of these things, but I am Marianne Brandt and I want that letter."

"I am sorry, madame, but the rules are strict, and you will have to bring some one to identify you."

By this time Brandt was in a state of high indignation. "You will not give me the letter? I will prove to you that I am Marianne Brandt!" And then she proceeded with full voice to sing the great cadenza from her principal aria in "Le Prophète." Her glorious voice echoed and re-echoed through the vaulted corridors of the post-office. Men came running from all sides to find out what had happened and finally the agitated official handed her the letter, saying: "Here is your letter, but for God's sake be quiet!"

Poland's Debt to Paderewski

Paderewski had always dreamed of a united and independent Poland. He knew the history of his people, their strength, and their weakness. It is said that one day he played before the Czar who, congratulating him, expressed his pleasure that a "Russian" should have achieved such eminence in his art. Paderewski answered: "I am a Pole, your Majesty," and, needless to say, was never again invited to play in Russia. His mind is one of the most extraordinary I have ever come in contact with. All the world knows what he has achieved in music—his inspired interpretations, his prodigious memory, and the subtle range of colors of his musical palette, but not so many know of his interest in literature, philosophy, and history, and it took the Great War to demonstrate that as orator and statesman he ranks as high as musician. I heard him make a speech on Poland during the Exposition in San Francisco in 1915 before an audience of ten thousand, in which he gave so eloquent a survey of Poland's history and of her needs and rights, as to rouse the people to a frenzy of enthusiasm, and I am convinced that Poland owes her national existence to-day to his statesmanship and to the sympathy which his personality created among the Allies at the Versailles Conference.

Widor and Big Bertha

When I first called on Charles Marie Widor, the famous old organist of Saint Sulpice, I found him installed, by virtue of his office as *Secrétaire Perpétuel* of the *Institut de France,* in a charming Louis XVI suite of rooms in that building. He showed me a hole in the window of his workroom and told me that a few days before he had just stooped down to pick up a musical score from the floor when a shell from the Big Bertha burst in front of his apartment and a piece of it hurtled through his window, missing him only because he was in a stooping position.

His Gallic wit and versatility make him a delightful companion, and I am grateful for the opportunity the war gave me for more intimate acquaintance and friendship with him.

Rubinstein's Champagne Supper

Rubinstein at the last rehearsal of one of his operas was so well pleased with the work of the orchestra that he turned to them and said: "Gentlemen, if my opera is a success you must all come to my hotel after the performance for a champagne supper." Unfortunately, the opera was a decided frost and the audience so undemonstrative that Rubinstein, in absolute disgust, laid down the stick after the second act, and, bidding the local conductor finish the opera, returned dejectedly to his hotel and went to bed. At eleven o'clock there was a knock at his door. "Who is it?" he shouted in great irritation. "It is I, Herr Rubinstein, the double-bass player from the opera orchestra." "What do you want?" "I have come for the champagne supper." "What nonsense!" raged Rubinstein. "The opera was a ghastly failure." "Well, Herr Rubinstein," answered the thirsty and undaunted double-bass player, "*I* liked it!"

Is Tschaikowsky Waning?

I have spoken in another chapter of Tschaikowsky's visit to America in 1891 as a guest of the Symphony Society. For twenty-five years his popularity was enormous and the mere announcement of his "Symphonie Pathétique" was sufficient to draw a crowded house. His symphonies appeared more often on our concert programs than those of any other composer. They have a rhythmic and elemental strength which appealed even to the unmusical, but to-day a distinct lessening of this popularity is noticeable. There is a lack of real symphonic development of his themes, and certain crudities of workmanship stand out more clearly as the works have become better known. Young conductors, anxious for ready and cheap applause, still choose one of his symphonies for their début, and the melodic charm of his lighter music, if not heard too often, will retain its place in the affection of our public for some time longer.

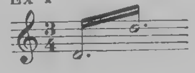
The Tremolo

By S. M. C.

The tremolo as applied to piano playing is a rapid repetition of a tone or a chord, often intended to produce the effect of the roll of drums, especially when occurring in the lower octaves of the piano. Since the notation of the tremolo is usually given in abbreviated form, pupils are often at a loss as to what to do, simply playing the note or chord once and letting it go at that. This is, however, not at all what the composer intended.

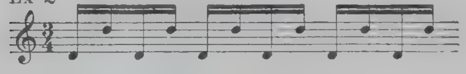
An abbreviation such as,

Ex 1



means that the performer should alternately play the low and high D for the value of a dotted half-note, at the rate of four sixteenths to one beat like this:

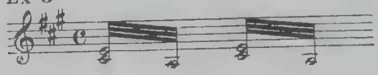
Ex 2



Skilled performers might make thirty-seconds of them, thus doubling the number of tones.

A tremolo on a chord is played by dividing the chord into two parts. This is sometimes indicated by the composer, as in the following example taken from the *Swan Song* from "Lohengrin," arranged by D. Krug,

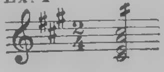
Ex 3



Here the player alternates between C♯-E and A for four beats, at the rate of eight thirty-seconds to one beat.

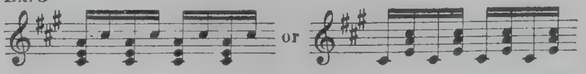
Sometimes a chord notated like the following occurs:

Ex. 4



This should be played:

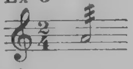
Ex. 5



The abbreviation *trem.* placed over the notes indicates a tremolo to be played as fast as possible, without regard to the number of notes played. The most ordinary way of indicating the tremolo is by two or three cross-strokes through the stem. A half note with one line through the stem would indicate that four eighth notes are to be played.

A note marked thus for stringed instruments

Ex 6



would indicate the note A repeated as rapidly as possible, alternating between up and down bow, for the time of one-half note. Such passages of ten occur in violin music, and are very effective when not overdone. This tremolo should not, however, be mistaken for the vibrato, which is produced in an entirely different manner.

The tremolo on the organ is produced by a special mechanical contrivance which causes the air before reaching the pipes to be admitted into a box containing a pallet to the end of which a thin arm of metal with a weight is attached. When the air is admitted it raises the pallet and causes the metal arm to swing up and down, thus producing the tremolo by reason of alternately increased and diminished air-pressure. The tremolo stop is frequently overworked by injudicious organists, and it then becomes a nuisance as reprehensible as the vocalist's tremolo, when badly executed.

In vocal music the term tremolo is applied to a much-abused means of striving after emotional effect by a slight departure from true intonation, which produces an undulation or waving of tones. The tremolo is supposed to have originated with the great tenor Rubini in the first half of the nineteenth century. When used at the right time and in the right way it is very effective, but when overdone it becomes positively ludicrous. Since the tremolo is frequently the result of forcing the voice, it constitutes one of the worst vocal vices.

Prepare Your Lessons, Teachers!

By Mae-Aileen Erb

No matter how wide a teacher's experience has been, it is, nevertheless, a wise plan to study constantly each individual pupil, and to spend much thought in the matter of his lesson assignments. Each child is unique and without counterpart. In the order of procedure and the amount of time consumed in the mastery of the various points of technic, there is a variation of surprising magnitude.

At the beginning of every season, the teacher should outline in a loose-leaf note book, several pages of which are devoted to each pupil, the amount of ground she wishes to cover during the year. Every few weeks notes should be added as to the actual progress made. Very often at a pupil's lesson, flashes of inspiration will pass through a teacher's mind as to certain studies and pieces which might prove of benefit to that particular child—or as to new methods of treatment for old subjects. Jot it down in that pupil's portion of your note book.

A teacher can always tell if a pupil's lesson is thoroughly prepared; and likewise the pupil can feel if the teacher has the situation well in hand. Therefore, the time devoted to planning the presentation of the different lessons in a manner conducive to holding the interest and arousing the enthusiasm of the student is well spent.

Every composition given to a pupil should first be thoroughly studied by the teacher, so that illustrations may be made at the keyboard. The serious teacher will also edit the work, revising the fingering to accommodate the size of the hand, interpolating dynamic signs which will beautify the piece, and appending brief notes as to the composer, the form, title or meaning of the composition. Do not be afraid of marring the pages; music thus marked is of far more lasting value to the pupil than the same pages, devoid of a single connotation, ever could be.

A NEW SERIES BY MARK HAMBOURG

"The Etude" is pleased to announce that it will present during the coming months a new series of articles upon piano playing of equal value to the self help student and to the student studying with a master, by the distinguished pianist Mark Hambourg. Mr. Hambourg has resided in England during the better part of his artistic life, except when upon his world tours. He has a remarkable gift of making pianistic problems exceptionally clear.

Finger Stretching and Strengthening Exercises

By Myra B. Duncan

Pupils with small hands, who find it difficult to reach octaves, will find the following finger-stretching exercises helpful.

Place your thumb and first finger on the arm of your chair and see how much space you can make them cover. Continue with the thumb and each of the other fingers. Do the same with the other hand. Try this also on the side of a table or stand near which you may be sitting.

At the piano or organ, press down two easily reached keys with first finger and thumb. Stretch the hand around the ends of the keys, pressing close against the keys for a second or two; then try to include another key in the reach, and continue until the limit of reach is found. Do the same with other fingers and the other hand.

With the fingers of the right hand bunched together, press down between the first and second fingers of the left hand, pushing them as far apart as possible. Do the same between the second and third fingers; then between the third and fourth. Stretch the right hand in the same way.

These exercises should not be continued long enough at one time to tire the fingers much; but, if persisted in for a few minutes each day, they soon will produce a marked improvement in the reach of the fingers and will also help to make the fingers more independent in action. The first part of the last exercise is especially recommended for violin students also.

Pointers for the Beginning Teacher of Music

By W. L. Clark

1. Give definite assignments of practice material. These assignments may be written in a pupil's note book or indicated on the music itself.
2. Be sympathetic. You will accomplish much by a sympathetic attitude toward the pupil. The timid pupil, in particular, will be encouraged to ask questions about portions of the work that present difficulty.
3. Be dependable. If you agree to give a lesson at a certain time make it a point to be ready at that minute.
4. Accept criticism with a smile. Some criticism urges us to do better work.
5. Be amiable toward the parents of your pupils. A parent who is pleased with your attitude as a teacher, will gain more pupils for you.
6. Study the history and literature relating to music to such an extent that you will have interesting material to present to the musical gatherings and clubs to which you may be invited.
7. Do not despair because of the pupil who learns slowly. It is often the slow learning pupil who gives the most effort to a lesson.
8. Make a study of each pupil.
9. Strive for definite results.
10. Do not take too seriously every mistake that a pupil makes. It takes time and effort to make an accurate player. Stress the pupil's good characteristics.

Away from the Half-Hour Lesson

By Ruth L. F. Barnett

The half-hour lesson once a week for beginners has always been a problem. It is usually not sufficient: and yet there are few parents who are both able and willing to pay for a full hour of an experienced teacher's time.

Here is a solution that is passed along gladly. Once a week my beginners come for a full hour of unprepared class work, and in that time we get over a good deal of theory, a keyboard drill, and some very necessary ear training. Then sometimes during the week each pupil has a half-hour private lesson at the piano. This is enough for hand-training and for the little pieces and studies prepared during the week.

The plan is good for several reasons:—

(1) The theoretical work, which is rather dull for one pupil working alone, goes much better in class, on account of the pleasant rivalry among the little folks.

(2) Each pupil feels more responsibility in the presence of others and this relieves the teacher of a part of the burden. It saves nerves.

(3) The teacher can give almost twice as many lessons in the same time it would take to give a full hour, and yet each pupil has an hour and a half with the teacher each week.

The Pianist's Sixth Sense

(The Sense of the Keyboard)

By CAMIL VAN HULSE

GIVING a correct definition of an abstract function or a mental capacity is a matter of tremendous difficulty, not to say impossible. Definitions always seem to be incomplete or altogether wrong. Some, consisting of only a few words, have taken the foremost philosophers a lifetime of thought and mental speculation before they were written down. Any real musician has been trying to find his own definition of "music," and to find out the origin of the spell it casts upon the human heart and intellect; several famous metaphysicians have written whole volumes about it (everybody should know *Combarieu's* book); yet where is the correct solution? Will it ever be found?

So we shall not try to give a definition of the subject of this article. It is a real "sense," which we may call the *sense of the keyboard,* or *the instinct of distances between keys.* It is of capital importance to all pianists, especially to public performers. It is this *sense of security, of self-reliance, that* "makes one feel at home" when at the piano; without it, there is not the slightest possibility of ever attaining more than average amateur skill.

Better than a definition, we shall give a vivid description of the effects of that capacity. Imagine an amateur lady, musically non-talented, playing for an audience of some friends. She is nervous, she "hates to show off," she "never touched a piano for the last three months!" Anybody, alas, has stood the torture of witnessing such performances! The unfortunate victim struggles and fumbles away to the bitter end; that is, to the last double bar, and then utters a sigh of relief, which is silently, but gladly, echoed by all the hearers. This is complete lack of keyboard-sense, aggravated by nervousness. Now, on the other hand, watch a blind pianist playing. He does *not* fumble. Whatever skips he may have to play, he always hits the right note. In fact, he makes less mistakes than one who sees! How is that? "Quite natural," say some people; "it is a general rule that, when a sense is lacking, the other senses become more active and accurate. And thus blind people get compensation for the loss of their sight by more effectiveness in their hearing and feeling." Yet, think it over, and you will positively find out that this blind man at his piano, *before* striking a note, neither can hear nor feel it! There is something else that makes him feel secure. He *knows* where to find every key; and he really *sees* (internally!) his keyboard! This is the "keyboard sense" at its highest possible degree.

Now, it is obvious that between these two extremes, the lady-fumbler and the blind artist, there are an infinite variety of intermediate stages. Some fumble almost continuously, others occasionally, others only exceptionally. This proves that there *must* be a way of developing that sense of security as well as we can develop *any* physical and mental capacity by training it and making a habit, or second nature, of it.

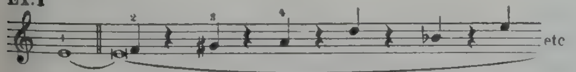
Another remarkable instance of that sense of accuracy is to be found in playing string instruments. Think of the tremendous difference in tone one-tenth of an inch means to the violinist—and yet of the astonishing accuracy the modern virtuoso possesses! Indeed, his accuracy of tone is far superior to that of the piano, as he can make a difference between C sharp and D flat.

Having explained wherein consists the sense of the keyboard, we shall now give a series of exercises especially designed to acquire and develop it.

First of all, it is of vital importance to *acquire* that *sense; that is, to "know what it feels like."* In fact, many pianists never have "felt at home" when playing in public. Therefore, the first exercises are so designed that *any* pianist, even a beginner, can play them, in order to give him a basis to start from in the further developing of his secureness.

1. Strike a key with the thumb (for instance E), then, having closed your eyes, determine mentally another key situated nearby the first one (for instance F) and strike it. In that same way strike all the different intervals from second to octave, all the time keeping the thumb on the same key. (Ex. A).

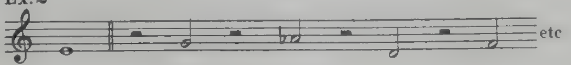
Ex.1



Then take other keys, also black ones, to start from, and do the same exercise. It matters but little what keys you choose; the main thing is to determine mentally *every* key before you strike it, so that your fingers obey to your brain. In this and all the following exercises it is impossible to "prepare" the notes; preparing is only possible when you look at the keyboard.

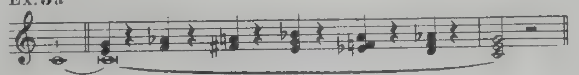
2. Do the same exercise, but lift the hand a few inches above the keyboard between each two notes. For instance: Strike E, close the eyes, determine mentally the key to strike: G, lift the hand, strike G, determine another key, A♭; lift the hand, strike A♭, and so forth.

Ex.2

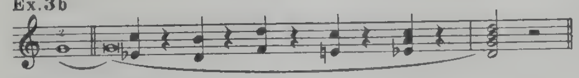


3. Departing from a given note, close the eyes and determine mentally chords consisting of 2 or 3 notes, and strike those.

Ex.3a



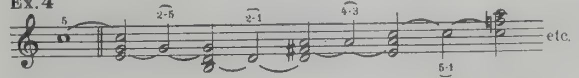
Ex.3b



To obtain greater variety in the course of the exercise, you can change fingers on the initial key and play the chords above or under it.

Another combination consists in changing the starting key after each chord, thus moving up and down the keyboard.

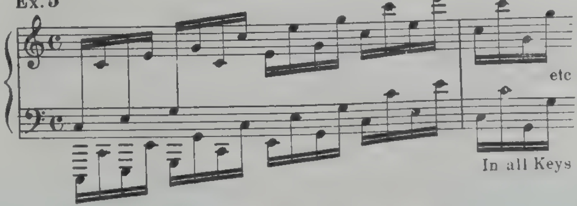
Ex.4



By and by you will get used to playing all the chords without looking at them, and you will *"feel"* in your fingertips all the different distances between keys.

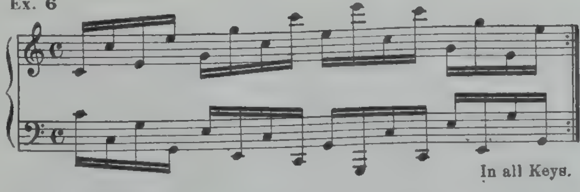
4. When you have reached this stage you should be ready to play *all* your exercises with closed eyes. If you feel it necessary to play them a little slower than you are used to, do so; it will do you good. And *every* exercise is to be practiced that way; none is to be omitted—five-finger exercises, scales, broken chords, arpeggios, octaves, double-notes, broken octaves, and so forth. A special mention is to be made of arpeggios in broken octaves. This is certainly one of the most difficult exercises to be practiced with closed eyes. Only long and patient work will master them.

Ex.5

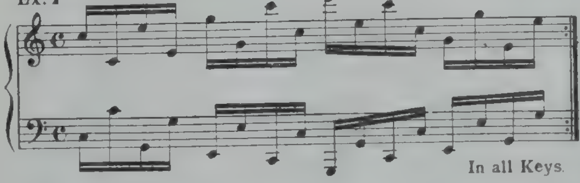


Most Difficult of All Are These

Ex. 6



Ex.7



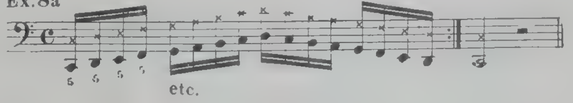
There is another invaluable advantage in playing with closed eyes; the student learns to *listen* to his own playing, and he learns gradually to make a more beautiful tone.

5. Look intently at the middle G of the keyboard. While doing so, determine in your mind a Key at a distance of more than an octave, and, without looking at it or preparing it, strike. If you have worked through the preceding exercises patiently and conscientously, you will be surprised at your success in this one. Then strike other notes, going farther away from the middle G, but without losing sight of it. This is the ideal *"sense of distances and relations at the keyboard.* Of course, you might as well keep your eye on any key, high or low, but the middle G is best adapted to the purpose. The reason of this is obvious. This G is "the true middle" of the whole keyboard. This G is one starting-point —your brain, directing your arm and hand, is the second one. Those two combined are the data for a formula of "instinctive trigonometry" the solution of which is hitting the right key. The middle G is like a "handle" by which the eyes and brain "grasp" the whole keyboard. Have you ever closely watched a great virtuoso playing? If not, do so; and you will notice that, as a rule, he never looks at the keyboard: his eyes are often gazing somewhere at a distant (or imaginary) point above the piano —or they are directed towards that middle portion of the keyboard, although he does not actually stare at the keys but rather a little higher.

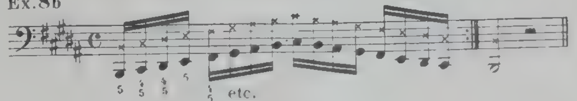
This exercise is mostly to be practiced with the left hand: it will prove of immense value for "picking" bass notes in waltz or dance music. It is necessary also, to design a special exercise for strengthening the 5th (and 4th) fingers, which has most of those notes to play. The best exercise to that purpose is the following.

6. Stretch your hand like if playing an octave. Drop your hand, striking only with the 5th finger, while you "shadow" the second note of the octave with your thumb. Play scales and arpeggios that way, and be careful to make a round and mellow tone. When playing on black keys, practice alternately both 5th and 4th fingers.

Ex.8a



Ex.8b

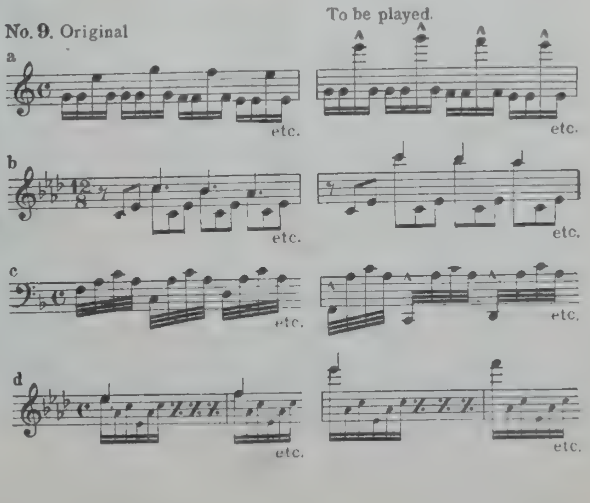


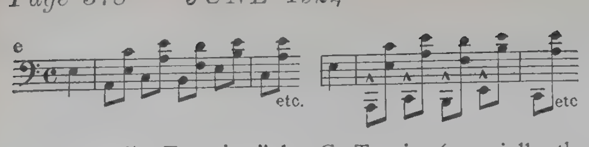
The question as to which finger to use on black keys, remains undecided. Some artists use 5th on white, and 4th on black keys; others use always 5th. Both methods have their advantages; while alternating 5th and 4th, greater speed and accuracy is possible—whereas using only 5th, there is more uniformity in tone. Each player should solve the problem for himself, according to the individual structure of his hand and fingers.

(In the case of single fortissimo notes on black keys, it is advisable to strike them with 2, 3, or even 4 fingers together, which should be held almost flat; this makes a very strong tone, without making it harsh or rude. If the tone *must* be a hard one, then hold thumb and third finger together and strike with a brisk motion of the wrist.)

Having practiced all these exercises, your sense of security ought to be fairly developed. The student who wants more material to work upon, can make himself as much as he wants. Take any studies by Czerny, Cramer, Clementi, Chopin, and others; open up the book, and you are almost sure to find a study which, with a few slight changes, can be turned into an appropriate exercise. Here are a few examples:

No. 9. Original





The "Daily Exercises" by C. Tausig (especially the Ed. vol.) and the "Virtuosenschule" by C. Czerny, furnish unequalled material for this study.

The student who will have carefully trained himself in the above described manner will be substantially rewarded for his perseverance. No matter what he plays, he will feel so much more at ease; nervousness will decrease proportionally to the increase of security; and his audience will have much more delight in hearing and watching him. Indeed, when a player is at ease, the audience enjoys his performance—on the other hand, anyone knows the sensation of uneasiness caused by watching a performer who is manifestly uncertain of himself.

Besides, the student will be delighted to see that such passages in the great master's works, which are unanimously proclaimed as requiring an unusual amount of separate practicing, will be as quickly mastered as others. To cite a few examples:

The 6th and 12th Variations of Mendelssohn's op. 54 in D minor.

The E flat passage (preceding the last repeat of the main theme) in the allegro of Schumann's "Vienna Carnival" op. 26.

The Coda in Part II of Schumann's Phantasy op. 17.

Etudes No. 2 and 8 in Moscheles' op. 70.

Etudes No. 4 and 9 in Chopin's op. 25.

The famous octavo-passages in Chopin's F minor Phantasy.

Numerous passages in Liszt's works, especially the Rhapsodies and the Etudes (Mazeppa!).

The initial bars of Tschaikowsky's B flat minor Concerto.

Numerous passages in the works of modern Russian composers, especially the studies of Liapunov (*Toime épigne! Lesghinka!!*) and those of Scriabin.

As a supreme test, we suggest etude No. 9 in E major of Czerny's *"Fingerfertigkeit."* The pianist who plays this study correctly and in the tempo indicated by Czerny (𝅗𝅥-92) may be assured that his "sense of distance" is perfect.

One more suggestion. To develop very rapidly your accuracy of touch, *play in the dark.* Closing the eyes always imposes a certain strain on the mind; therefore, play in a dark room. Begin with easy pieces which present no difficulties—then, work up gradually your whole repertoire. And here is a splendid opportunity to *listen* to your own playing, and to *criticize* yourself without mercy.

Self-Help Questions on Mr. van Hulse's Article

(1) What really is "The Pianist's Sixth Sense?"

(2) Of what practical value is this "sense" to the pianist?

(3) What expedient aids the rapid acquisition of this sense?

The Russians and Musical Pictures

By I. de Glanzovski

Since the time of Glinka there is one outstanding characteristic of Russian music which seems to distinguish it in a measure from that of other lands. That is the strong tendency to employ music to picture scenes, characters, emotions, legends. Composers of other nations have done this, but not to the extent done by the Russians.

Although no Russian would distinguish Rubinstein as a Russian, he was proud of his Muscovite birthplace, notwithstanding his all-semitic ancestry. Rubinstein's music is largely a series of musical pictures; and he delighted in nothing more than to attempt to paint a portrait in tones such as the "Kamennoi Ostrov" series, embodying his impressions of personages and events at a river summer resort near St. Petersburg, which now, under penalty of the law, must be called Leninegrad in Russia.

Tschaikowsky, partly Jewish in his ancestry, was also strongly pictorial. His "1812" Overture, with its clanging bells, is a fair example. He was always at his best in program music.

Often, however, Russian music is so vigorous and fanciful that many have assigned programs to it never intended by the composer. Rachmaninoff's *Prelude in C Sharp Minor* is perhaps the worst victim. Rachmaninoff has repeatedly denied any program in this composition; but numerous stories have been connected with it, and it is often seen on programs as "The Bells of Moscow."

What the Critics Did to Wagner

Probably no composer met with such bitter opposition in the fight to get recognition for his works as did Richard Wagner. He was considered a kind of target at which all kinds of insults might be flung. Some of the criticisms and caricatures were very witty indeed, even though they were at the expense of a struggling musician. J. Cuthbert Hadden, a well known English writer, contributed to the *Monthly Musical Record* some time ago a pertinent article upon this subject, part of which is quoted herewith.

"Take the caricaturists first. These found in Wagner a never-failing object for their pencils. From his works they drew 'delirious lovers, solemnly posing knights and ladies, extraordinary gods, half-gods, giants and dwarfs, to say nothing of an amazing menagerie including varieties of animals, from the toad to the dragon.' They pictured Wagner playing to a dancing procession of money bags and, in reference to his orchestra of 'the future,' drew a group of cats of different sizes, backed by a row of howling youngsters under uplifted maternal hands, chafing under chastisement.

"A mother wept by her cradle as she realized the kind of music (that eternal 'music of the future') reserved for her babe. For the wits had extended the phrase so as to read: 'The music of the future—of lost souls.' At a Wagner concert a 'payer of the future' suggested that the box office should wait for ten years. Wagner himself was shown in a great variety of occupations—driving the sharp ends of enormous quarter-notes into the public ear, experimenting with saucepans, entering the opera on the shoulders of his supporters while a bystander had his hat smashed over his eyes for shouting 'Vive la musique!' In heaven he advises the addition of brass and drums to the usual harps; he gives lessons to Mozart and Beethoven; he fills up his spare time by turning the spits on which Offenbach and other conventional opera composers are being roasted in the lower regions. These were among the caricaturists' humors.

"If we turn from pencil to speech and writing, we shall find still more to amuse us. Even brother contemporary composers did not receive Wagner gladly. Rossini went to hear 'Tannhäuser,' and was asked his opinion of it. 'It is too elaborate a work to be judged after a single hearing,' he said, 'but so far as I am concerned, I shall not give it a second.' Later on a friend handed him the score of 'Lohengrin,' and presently remarked that he was holding it upside down. 'Well,' replied Rossini, 'I have already tried it the other way, and now I am trying it this, as I really can make nothing of it.' Even Schumann declared that 'Tannhäuser' and 'Lohengrin' were amateurish—a criticism which Wagner repaid by saying that 'Schumann has a tendency to greatness'—only a tendency!

"After listening to 'Tristan,' Berlioz observed: 'I must confess I have not the slightest idea of what the composer wants to say.' Wagner described Marschner as 'the last and most important follower' of Spohr and Weber. But it was Marschner who said: 'If Wagner, who is a highly gifted man, had been a genuine composer, he would not have thought it necessary to make such a noise, and to employ quack methods to win musical fame and hide the poverty of his productions.' Saint-Saëns, in his 'Harmonie et Mélodie,' calls Wagner's works 'powerful but odd.' Of the 'Ring,' Tschaikowsky remarks that 'there never was such endless and tedious twaddle.' The mere bulk of the thing 'bores me to death,' he adds.

Mérimée's "Kitten on the Keys"

"If his fellow-composers could not stomach Wagner, it was hardly to be expected that the amateurs and even the general rank and file of the profession would. Some of the queerest things said about Wagner's music-dramas were said by the amateurs. When they first heard 'Tannhäuser,' they found the subject 'Distressing and harassing,' and declared that the music was formless and devoid of melody. They even asked why Tannhäuser shouldn't marry Elizabeth and all end happily! Prosper Mérimée, to whom we owe the story of 'Carmen,' said he could compose something as good after hearing his cat walk over the keys of the piano.

"When 'Lohengrin' followed, it had no better reception. It was said to be 'the apogee of hideousness, a distracting and altogether distressing noise, a mere blaring of brass, and a short method of utterly ruining the voice.' John Hullah called it 'an opera without music.' To Gustav Engel it seemed like 'blubbering baby talk.' Dr. Hanslick, Germany's leading musical critic, wrote that 'the simplest song of Mendelssohn appeals more to heart and soul than ten Wagnerian operas.' It is of 'Lohengrin' that the familiar story (an invention, of course) is told about a man being cured of deafness after a hearing. The patient had gone to the theatre with his doctor. Suddenly, when the orchestra was at its loudest, he exclaimed: 'Doctor, I can hear!' The medico took no notice. 'I tell you, Doctor,' repeated the man, 'you have saved me: I have recovered my hearing.' Still the doctor remained silent. He had become deaf himself!

"After 'Lohengrin' came 'Tristan,' which was everywhere declined as being 'impossible.' When it was at length heard in London, the critics complimented the solo artists on getting through 'a terribly trying task.' One surprised critic wrote: 'We are at a loss to imagine how the artists contrived to get their respective parts into their heads, and our wonder is that their physical resources endured the strain of reproducing them. A very little of such work must tell upon the most robust performers.' Schröder-Devrient, one of Wagner's heroines, frankly told him: 'Herr Wagner, you are a genius, but you write us such queer stuff. One can hardly sing it.' Tolstoy once dropped in to hear the 'Ring' on the third evening, and condemned it as bad art. Max Nordau found it, and Wagner generally, 'a bleating echo from the far away past.' And so on, and so on. Verily, the whirligig of Time does bring strange revenges!"

The Motionless Hand Tradition

By Raymond Thiberge

(The following article has been translated from the Paris *Le Monde Musical* by Edward Ellsworth Hipsher.)

Here is that which has been written on this subject: "There is a disagreement between the manner of playing of artists and that which most methods teach. These teach still the technic which we have from the time of the clavichord and spinet." In effect, whilst intellectual teaching was undergoing a profound transformation, till the methods were rejuvenated and modernized, musical instruction moved but slowly to get rid of the experimental processes. To convince ourselves if there are not some exaggerations, we take a point that we encounter in all the methods which it is possible for us to use with the child: the motionless hand. All the methods recommend, in effect, not to move the hand in playing on the piano. Zealous professors have themselves practiced the placing of a piece of money on the hands of their pupils, requiring of them that it stay there. How many children have been martyred by this proceeding! And how regrettable it is that the pupils have not had the good idea to ask their teacher to make this trial of skill in executing, for example, a sonata of Beethoven. They would be much amused by the embarrassment of their instructor; for not a pianist is capable of playing a piece with absolute immobility of the hand.

A bright door-keeper of Paris, by his simple good sense, settled it thus: Exasperated to see his little girl crying at each lesson by reason of this "cursed sou" which was obstinate in falling, he imagined an original enough expedient. From each merchant of his quarter he asked for a pierced sou.

"You think that this will bring you good luck?" they said to him.

"No," he responded. "The piano teacher of my little daughter holds absolutely to her playing with a sou on her hand. At each lesson the sou tumbles, and, notwithstanding that, the mistress persists. As you think, it is the cause of fits of tears. This has continued too long. I have enough of it. With a pierced sou, I would be able to pass through it a thread and to fix it on the hand which makes it always to tumble. Since the sou will stay, the mistress will be satisfied and my little girl also."

This smart man had surely found the only solution; and this story is authentic.

Our illustrious master, M. Camille Saint-Saëns, was in accord with this door-keeper. "Most of the pieces which Liszt has published seem unexecutable for all others than himself; and they were so, in fact, with the processes of the old method prescribing immobility, the elbows at the body, and action limited to the fingers and the fore-arm."

Simplified Fingering for Beginners

By Sylvia Weinstein

Beginners who use faulty fingering may be set on the right track with the following simple method:

Take one line at a time and have them point to each note and name the number of the finger used. Where the printed numbers occur, this is very simple but between the numbers they have to do a little reasoning. One finger is required for each consecutive note; skip as many fingers as notes are skipped.

With a little practice this will overcome the most stubborn case of bad fingering. At the same time the close observation of intervals which is made necessary assists in sight reading.

A New Way of Reading the Same Old Notes

By CONSTANTIN VON STERNBERG

THE ETUDE herewith presents one of the last articles of Constantin (Ivanovitch edler von) Sternberg, who died in Philadelphia, March 31, 1924. Mr. von Sternberg was born in Petrograd, July 9, 1852. He was a pupil of Moscheles, Coccius, Reinecke, Brendel, Richter, Hauptmann, David, Kullak, Wuerst, Dorn and Liszt. He acted as a conductor at various European opera houses and became Court Pianist at Mecklenburg-Schwerin. After concert tours in Europe, Russia and Asia he settled in the United States, devoting most of his time to composition and teaching, founding the Sternberg School of Music in Philadelphia. Mr. von Sternberg contributed numerous brilliant educational articles to THE ETUDE and other journals.

In presenting the following suggestion I feel like beginning by saying, "Don't be alarmed; it is nothing new—only a new angle from which to look at the same old matter." The new angle, however, may make as much of a difference to a pupil as to the two dream-interpreters made to the sultan who had dreamed that he had lost all his teeth. His first dream-interpreter made a sad face and said, "Woe unto thee, Brother of the Sun, for thou wilt see all thy relatives die." Upon which he was promptly beheaded and the second interpreter sent for. This one, noticing the débris of the first one still on the floor, bethought himself of a better way of saying the selfsame thing and addressed the sultan with a joyful voice, "Hail to thee, O Sultan, long life will be thine, for thou wilt *outlive* all thy relatives!"—for which he was richly rewarded. He had looked only from a different angle at the same thing—and that is all that the following suggestion purposes to do.

The Boy's Question

Some years ago I was teaching a boy the musical notation and told him that on the upper staff the first line is "E," while on the lower staff it is called "G." The boy at once asked me, "Why?" and I well remember how that question baffled me for the moment, until I thought of the clefs and explained that "clef" is the French for "key" and that the two clefs furnished the key to the naming of the lines. The boy's face showed no signs of understanding; he looked as if he thought, "It may be so, but I don't see it;" and I did not wonder at it because I, suddenly, did not "see" it myself. His question had unexpectedly brought me face to face with a matter which, from long habit, I had accepted as "settled once for all." In these days, however, of Roentgen, Einstein, Steinach, anti-Darwinism, wireless telephones, radio and motorless aviation, I felt that a reexamining of piously accepted old theories and methods was not altogether uncalled for, especially when they concerned fundamental pedagogic matters.

I might, however, have forgotten the boy's question if, soon afterwards, a similar query from another pupil had not brought it back to my mind and this time caused me to ponder over the question, "Why are the bass lines named different from the treble lines?"

An Apparent Discrepancy

I found that they are *not* differently named; that they appear to be so only because we were not taught to regard the bass staff as a mere continuation of the treble staff—but I am running ahead of myself. As I said, I was at a loss for an answer which after a while, strange to say, occurred to my mind during a piano lesson. The pupil was playing something that contained scale runs in contrary and in parallel motion, and I noticed that, as usual, the parallel motion caused him much more difficulty than the contrary motion. In searching for the reason of the difficulty it occurred to me that the natural, instinctive motions of the two arms were in opposite directions, and that in parallel motion one arm had to *stretch out* in the direction *away from* the body while the other arm had to *bend in* and move *toward* the body, which requires that one arm move different from the other. This observation led me to the next one that, when applied to the motions of our arms, the terms "parallel" and "contrary" are somewhat confusing; for in making the same motion with both arms the "natural" tendency is to move them either both away from or both toward the body, not one arm toward and the other away from the body. The simplest dumbbell exercise will confirm this statement. Ask any person to "move the arms" and the result will be that the right arm stretches to the right while the left arm does it to the left. Place before a piano a person that knows nothing about playing; ask him to move the fingertips over the keyboard so that both arms make the *same* motion and he will instinctively move the right arm to the right and the left arm to the left. These two motions could, of course, not be called "parallel" but they should undoubtedly be "analogous"—and what is an analogy if not a mental parallel?

These reflections associated themselves in my mind with the questions that were asked by the pupils already mentioned and also by many others afterwards. Putting myself in the mental attitude of a young pupil, I found it quite natural that he should be confused by reading the lower staff *upward* when his arm, in conformity with the other arm, wants to move *downward;* in other words, his eye must move up and the arm move down. Thus there arises a divergence between eye and arm, a disagreement which, mark well, is not caused by the notation itself but by the manner or method in which the reading of it is taught.

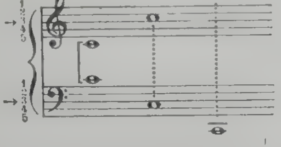
CONSTANTIN VON STERNBERG
A Photograph taken Expressly for "The Etude"

A Quicker Method

Since that time I have experimented with quite a number of pupils and I have found that they learn to read music much quicker if the bass lines are counted downward.

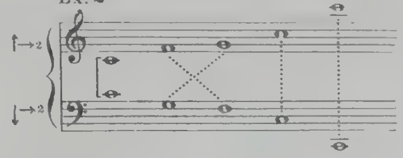
Let me illustrate: Beginning at middle "C," as we always do, let us count the upper lines upward and the lower lines downward. We shall then find that the next "C's" both above and below middle C, are both on the third space—and not the one on the third and the other on the second space as hitherto. Looking now for the next "C's," above and below, we find them both on the second added line beyond the staff, in the natural directions.

Ex. 1



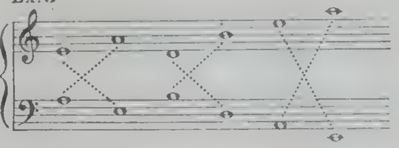
If we now let the pupil place both thumbs upon middle C, and tell him to play his fingers out, one on each succeeding key, he finds that the little finger of the right hand arrives on G while the corresponding finger of the left arrives on F. In other words, the two last fingers of the right played F-G while the two last fingers of the left played G-F, which is quite in conformity with the anatomy of the hands. Applying this to his reading he finds—reading the lower staff downward—that both notes occupy the *first* space and *second* line, of course in that reversed order in which the hands are built. He finds, furthermore, the reason why both clefs are placed on the second line: the upper clef on the second line upward, the lower clef on the second line downward.

Ex. 2



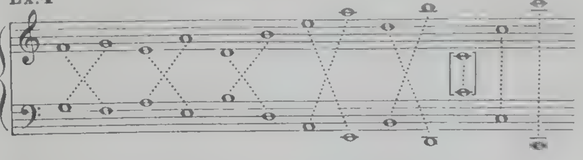
The analogies we find in reading the lower staff downward—besides conforming to the natural tendency of arm and fingers—go much further. We have in the upper staff "E" and "A" on precisely the same lines and spaces as we have "A" and "E" in the lower. It is the same with "D and B" or "B and D" respectively.

Ex. 3



If the reader will turn the following illustration upside down and hold it before a looking glass he will obtain precisely the same picture as he sees now

Ex. 4



and the clefs should be altogether superfluous were it not for those cases where left hand notes are placed in the upper staff, or *vice versa.*

Now in suggesting the foregoing manner of teaching notation I do not join the ranks of those shallow-brained fellows who mean to change the notation, itself. Every few years ever since Rousseau—some foolish musicaster invents a "new musical notation." I have nothing more in mind than a little different way of *looking* at our old and wonderful notation. And, in view of the anatomy of the two hands, it seems as if nature, itself, supports the suggestion here presented; for, the two thumbs are not on the same side of the two hands but on opposite sides; and, as we count the fingers of the right hand 1-2-3-4-5, rightward, so do we give the same numerals to the left hand *leftward,* because counting rightward we should have to say 5-4-3-2-1.

Having presented the foregoing plan as a mere "suggestion" I showed that I do not mean to be in the least dogmatic but that I hold my mind perfectly open to any and all justifiable objections—inviting them, in fact—but it seems to me, for the present at least, that the way of reading the bass lines downward tends to make our reading conform, better than heretofore, to the instinctive, natural motions of the arms and hands, thus turning the accustomed "parallel" between the eyes and hands into an "analogy."

Self-Test Questions on Mr. Sternberg's Article

(1) How shall the pupil be made to understand the difference of location of the same letter on the treble and bass staffs?

(2) What are the "instinctive motions" of the arms in piano-playing?

(3) Need we invent a "new musical notation" in order to simplify reading?

(4) Who were the famous teachers with whom Mr. von Sternberg studied?

Over-Taxing the Hands

By Charles S. Smith

During a visit to a friend who was an unusually fine pianist despite the minor defects which mark the uncompleted musical training, he asked me to hear him play a few pieces.

After finishing an etude with some difficulty, he said, "My hands seem to be stiff by nature. The muscles of my fingers do not act freely although they are not tired. They were not that way a month ago." A pause; and then he added laughingly, "I often apply liniment to my hands and fingers in order to loosen them up a bit and make their muscles more flexible. My teacher is on her annual vacation and I have been trying to master some of the difficult things we had begun."

I then asked the amount of his practice, receiving as answer, "I practice off and on, whenever I fall into the mood."

To which his mother remarked, "He's forever at that piano, continuously bang-banging over that new piece. It's a wonder that neither he nor the piano gives out—at the rate they work."

His mother spoke truly; and it usually happens that the player's hand is exhausted before the instrument collapses. My friend had simply overworked his hands at the piano, causing the perplexing stiffness which he said usually came at the end of the day.

Now an excessive amount of strain was being thrust upon his hands. The good will of a pupil is always gratifying to a teacher; but in this case the gratification would surely be less at finding a pupil ruining his fine ability by over-practice.

Four hours a day of practice is a plenty. A student unable to master his work in four hours will not do so in eight. It is unusual for a person practicing seven or eight hours a day to become a greater artist than the one who ordinarily practices four; for the hand will not stand the additional strain.

This particular pupil was advised to discontinue the application of liniment, a temporary stimulant, for lessening stiffness. If the hands are unusually stiff when starting to play, as when caused by coldness, it does little harm to dip the hands in warm water for a minute or two.

The best remedy for stiff hands is never to allow them to get into this condition. It often happens that after several hours of steady practice the hands begin to tire and lag. Scattering the practice in shorter periods throughout the day will avert this.

Personality Counts

By Will Cowan

There is an indefinable inspiration exuding from the active, healthful spirit of an individual, which is more or less infectious. The one coming in contact with such a nature instinctively absorbs a part of its mood. The law of attraction is as active among souls as with material objects.

The musician, of all people, should cultivate a buoyant, responsive, enthusiastic disposition. Not only will this carry him over many a rough place, but also it will draw to him those who are most earnest and responsive in their ambitions to achieve. Along with this his attainments and personality may fan the spark of aspiration in many another and perhaps hearten some of these to strive onward to unsuspected heights.

The Operatic "Failure"

Some of the operas which now enjoy the greatest public favor were most vilely treated at their premieres. "Carmen," "Faust," "Tannhauser," and "La Traviata" each had to win its way with the public after a dreary infancy.

Nor are composers immune from similar vagaries of fate. Mascagni's early compositions were so coldly received that he had decided he was a failure. Then he noticed the prize offered by Sonsogno for a one act opera. Deciding to make the trial, the result was his immortal "Cavalleria Rusticana" which created a new operatic model. Having been awarded the prize, the work was given its premiere at the Teatro Costanzi of Rome, May 20, 1890. The morning papers of the twenty-first announced the "arrival of Verdi's successor." Subsequently, Leghorn, Mascagni's birthplace, has struck a medal in his honor and he has been made a "Cavalier of the Crown" by the King of Italy.

Do You Know?

That the Jig (also spelled Gigue, Gique, Gigua, Giga, Chique, Gig, Gigg, Gigge, Jigg, Higge, Jeg) is of English rather than Irish origin.

Then and Now

John Orth, Noted Boston Pedagog, Traces Fifty Years of Musical Progress

JOHN ORTH AT 21

JOHN ORTH NOW

To the Editor, "Etude":

Then and now—what a fine idea! Let me say that my "Then" began in 1866—the year that I came to Boston from Taunton, Mass., my boyhood home; the season that Ernst Perabo and Carlyle Petersilea returned from studies in Leipzig, creating a very large stir in Boston musical circles. B. J. Lang, Otto Dresel, J. C. D. Parker, and Emil Leonhard, were monarchs of all they surveyed in the musical world in general, as well as in the realm of the piano in particular.

'Twas not many years before these four dominating personages had to divide honors with newcomers. There were the redoubtable Sherwood, the ultra-conservative Baermann, the massive Maas, the able Faelten, the hypersensitive Otto Bendix, the brilliant MacDowell, the literary Amy Fay, and the fascinating Mme. Madeleine Schiller. Now we have, besides Buonamici, who recently passed away, and Heinrich Gebhard, a number of young fellows like Lee Pattison, Guy Meier, Raymond Havens and others, who are bubbling over with talent, and promise to be worthy successors to those who have come before.

Carl Zerrahn was the mighty one as conductor of the Handel and Haydn Society (Oratorio) and the Symphony Concerts of the Harvard Musical Association. Since Zerrahn, we have had Bernard Listemann and the Boston Philharmonic Orchestra, then the wonderful Boston Symphony Orchestra, founded by Henry L. Higginson, the Boston banker, with Henschel, Pauer, Gericke, Nikisch, Muck, Fiedler and now Monteux, as conductors. In the field of choral work Emil Mollenhauer has succeeded Carl Zerrahn. Then we had, speaking of composers, John K. Paine, with his "Spring Symphony" ("Œdipus Tyrannus"), and other compositions, who stood practically alone at that time.

We now have George W. Chadwick, Arthur Foote, F. S. Converse, Henry F. Gilbert, Arthur Whiting, Charles M. Loeffler, Mrs. Beach, Margaret R. Lang; also Ethelbert Nevin and Horatio W. Parker, who have passed on.

It was in the 60's and 70's that the Mendelssohn Quintette Club reached its zenith, the personnel at that time being William Schultze, Carl Meisel, Thomas Ryan, Edward Heindl, Wulf Fries. Later on we had the Euterpe Quartette, with C. N. Allen, Wulf Fries, and others, which was succeeded by the renowned Kneisel Quartette. We now have the Hoffman Quartette, and the regular visits of the Flonzaleys from New York.

In the vocal world we had Mme. Rudersdorff, Charles R. Adams, George L. Osgood, Max Heinrich, Myron W. Whitney, George J. Parker. We now have Charles Hackett, Roland W. Hays, Stephen S. Townsend and others.

During all this time we had some brilliant critics, including dear, old, conservative John S. Dwight, to whom Wagner was nothing but noise. I think Mr. Dwight would have sympathized with the Berlin critic who said, "If all the cats and all the hand-organs in Berlin were brought together under one roof and set-a-going, one would get a good idea of what Wagner put forth as music." Julia Ward Howe once called it multi-muddle. We also had the splendid but rather caustic B. E. Woolf, the aristocratic W. F. Apthorp, the self-made Louis C. Elson, who said "Music is the most expensive of all noises as well as the most expressive"; and now, the erudite, scintillating Philip Hale, and clever, whole-souled Olin W. Downs.

One of our musical thinkers has said that Boston is not as musical as it was thirty years ago. This took me aback when I heard it; but do you know, the more I think of it, the more I feel that way myself.

—John Orth.

Insist Upon a Good Piano For the Recital

By Nicholas J. Elsenheimer

"I could not do myself justice, since I had to play on a strange piano," has a familiar ring to the ears of every piano teacher, when students answer an inquiry into shortcomings relative to the rendition of pieces assigned to them for a public recital. While this is a ready excuse there is, nevertheless, one feature that deserves serious attention. The pupils are almost always compelled to perform on an instrument that is absolutely strange to them.

No virtuoso will risk playing a recital without having tested the quality of the instrument he is advertised to use. One might say, "this is true, but is he not a professional who charges admission and compelled to be extremely careful?" Indeed, he is. Because he is looked upon as an exponent of a noble, refined art, he realizes the importance of an instrument that fulfills every demand made by his talent and interpretative powers. He is in a fortunate position to command respect of his wishes by the firm which in turn reaps a harvest of legitimate advertising.

No such consideration is shown in the selection of instruments for students' recitals, which even with a charge for moving expenses often prove a big disappointment to all parties concerned. While no fairminded teacher of experience expects the best instruments for use in recitals, there is no reason for the display of a mediocre or an inadequate instrument. The first of all requirements spells—purity of intonation. The piano should be in good tune. Its action should be not too heavy nor too light. The pedals must be in working order and obey the slightest pressure of the feet and bar squeaky noises. The fulfillment of these demands guarantees genuine satisfaction.

It certainly is of real benefit to the inexperienced performer when unexpected difficulties in the nature of such conditions as enumerated before are not confronting him. The existing lack of familiarity with the instrument on the platform does not prevent a fair account of the player's ability when complaints about the piano are not justified. From a business point of view, the policy of inferior instruments in students' public performances is, mildly expressed, a great risk. It is a reflection on the name and reputation of the firm when valid reasons exist for severe criticism on the part of the teacher and his clientele.

Dissatisfaction will exercise a certain influence on the attitude of prospective buyers who are not influenced by a name but prefer to listen to expert advice. In many cases they will rely on their experience; or they may place confidence in the judgment of trusted friends, when the question arises as to selecting a piano for home use. It is certainly not advisable to feature the slogan: "Advertisement covers a mutitude of deficiencies or carelessness." Indifference is the first and quite often the surest step towards retrogression. The clientele of conscientious and experienced serious teachers, of students and their circle of friends and interested well-wishers is not so unimportant as to justify a slight or a blemish on the good name of a respectable piano firm and its appeal to refined taste and judgment of all lovers of the most useful instrument during the last two hundred years.

A Uniform Fingering For Major and Minor Scales

By E. S. Church

Much trouble in the playing of Minor scales may be avoided by using the following rules for fingering both Major and corresponding Minor scales.

First group—C, G, D, A and E—fingered: 1,2,3; 1,2,3,4; 1,2,3; 1,2,3,4,5. Right Hand ascending. Left Hand descending.

Second group B♭, E♭, A♭, D♭, (C♯), G♭, (F♯), fingered with fourth finger in the Right Hand on B♭, (A♯), fourth finger in the Left Hand on G or G♭ (F♯).

The odd group B (C♭) and F are fingered with a combination of the first and second groups: viz: B or C♭ Right Hand fingering—1;2,3; 1,2,3,4; 1,2,3; 1,2,3,4,5. Left Hand descending—1,2,3,4; 1,2,3; 1,2,3,4; 1,2,3,4. F—fingering for Right Hand—1,2,3,4; 1,2,3; 1,2,3,4; 1,2,3.4. For Left Hand—1,2,3; 1,2,3,4; 1,2,3; 1,2,3,4,5.

This plan necessitates a complete change in the Left Hand fingering of the second group of scales, but with care is easily acquired. With the beginning student there is naturally no difficulty.

Every man should bring himself to the realization that delay and procrastination are the pastime of those who cultivate failure.

Music History For Music Lovers

By *CLARENCE CHANDLER*

Students of music, except the genius who occasionally appears as a meteor in the musical firmament, do not reveal much eagerness to study the history of esthetics or of their art. The piano student wishes to learn to play the piano; the vocal student sees nothing in his art beyond a few songs and vocal gymnastics. "They (the music students) never know anything at all about the history of music," says Herbert Witherspoon. "Only the most elementary notions of the drama and the shadiest possible idea of the literature of their own nation, let alone that of any other. Two or three hours a day of scales, a few songs, and that is all."

"When do you think that I can graduate?" asked the ambitious piano student of the professor, who had been allowed only a few weeks in which to acquaint himself with the student's capabilities.

Professor. "Have you studied the compositions of Chopin, Liszt, Beethoven?"

Student. "Yes."

P. (Pointing to a passage in the composition just played by the student). "To what key does this music modulate?"

S. "I don't know."

P. "Have you studied Harmony?"

S. "Yes; I went through the whole book, but I don't remember any of it now."

P. "What is the meaning of this musical term?"

S. "I don't know; I used to have a musical dictionary—it's somewhere about the house—guess I can find it if you want it."

P. "Have you studied the History of Music?"

S. "No."

P. "Do you read the biographies of the musicians, critical or technical works?"

S. "No."

P. "Are you acquainted with the musical magazines, such as The Etude, Musical America, Musical Courier, Musical Leader, Musical Observer or The Musician?"

S. "I—I—I had three or four copies of The Etude several years ago, but I haven't read them since."

This seeming lack of interest of the music student for those subjects necessary to qualify one as being well educated in the art may be traced to two general causes: Ignorance of the value of the literary and technical studies—nay, the necessity for them in a musical education—and the student's desire for speed, believing that the waving of the magical certificate will open all doors of opportunity for him.

The New Patent Roll

The musical press, some time ago, stated that a prominent manufacturer of music rolls for automatic pianos had paid a handsome sum for a new patent. This patent is a contrivance which gives a brief description of the character of the roll, the music, the composer, and other material which will assist the listener to an enjoyment and appreciation of the composition. Comment is hardly necessary. The item is brought to the attention to illustrate to the skeptical that the manufacturers believe, from a business standpoint, such an innovation will be financially successful. They are certain that the great army of musical amateurs are anxious to acquire a knowledge of musical history, biography and analysis, and will pay for it at one time or another. Significant and valuable for the listener as such a help can be made, we should not allow it to blind us as to its true significance. A drop of water will never quench the thirst of the exhausted wayfarer; neither can a ray of light disclose all of the beauties of nature, and whatever knowledge is conveyed to the listener through the above-mentioned means is only a crumb of the vast amount of intellectual and esthetic food available for the music lover's appetite.

In the first place, music cannot be separated from the larger life of mankind. While it is the most difficult to comprehend, it is also the most sociable of the arts. It is a product of the times. It reflects the influence of social conditions. National characteristics of temperament are probably as clearly defined through music as through literature. Profound national sorrow has left its indelible tracings on the musical life of a people as prominently as on its literary life. Social conditions affecting the individual composer have been the means of directing the course of his genius. The possible musical equipment, technic of the art of the writers of a definite period, or the development of musical instruments, has been a controlling influence over the composer's mode of expression as well as the contents of his message.

So the history of music, viewed broadly, is not, specifically, a record of dates of local events nor the rise and fall of dynasties. The historian sees through and beyond the record of surface situations or phenomenon chronicled by ordinary history into the deep wells of universal motives, aspirations, beliefs, hope, defeats, victories. He sees as it were into the subconscious mind of the nations, the great primal struggles, not with foes without, but with conditions within, the sources and directions of national progress, and reads the history of the centuries as we read the history of the day. But music is closely bound up with movements of literature, religion and ethics, so that the life of the individual composer must be closely scrutinized. Environment, experience, outlook on life, play so prominent a part in the composer's product that every element which combines to produce his personality must be weighed and judged in the light of historical events.

Beethoven's Persistent Methods

For example, in studying the music in Beethoven, does it not help to know some of the circumstances of his life and the conditions of musical development of his time? That Beethoven brought to perfection the sonata form, the form in which most of his compositions were cast? That where composers of to-day use scores of titles to suggest the direction of their thought and the character of the composition, Beethoven limits himself to almost one, and his ideas covering the whole gamut of human emotions is expressed therein? Do we not often find in his music a fuller expression of his inmost feelings than is conveyed by his letters? And would his music make the same appeal to us if we did not know some of his personal traits of character and the conditions under which it was produced? Is it not a source of inspiration and enthusiasm to know that Beethoven, who reached the pinnacle of the art, and whose name in music is synonymous with Shakespere in literature, worked weeks and months in his quest for perfection, as is shown by his notebooks, over what appears to us a simple and spontaneous melodic passage? This man of loftiest ideals worked year after year under the most disheartening circumstances.

Is it impossible for present-day musicians to draw a profitable lesson from the life of Beethoven? To be sure there are critics who repudiate the idea that music has any concern with the subconscious. Yet to hold to this belief would be to assert that music stands isolated from the other arts and is merely a progression of superficial sounds unrelated to the mind which produced them. To such as might withstand the force of disillusion, read the literary works of Schumann, Wagner, Liszt or Tschaikowsky.

History gives us the romance of music. It shows the composers as real men and women and the times in which they lived, their failures and successes, their sorrows and their joys. The subject stirs the imagination as no other can, and after acquiring a satisfactory technic, there is no element entering into a musician's equipment in which he is so deficient.

With this thought in mind let us turn to the compositions of Edward MacDowell, a modern composer whose piano music every student knows, at least superficially, and answer as best we may in a limited space why the study of the history of music will benefit the player and the listener. If we take a list of the titles of his pieces our attention will at once be attracted by the fanciful and suggestive names which designate a majority of them. *From an Indian Lodge, A. D. 1620, To a Wandering Iceberg, Shadow Dance, The Shepherd Boy, From Uncle Remus, Silver Clouds, An Old Garden, Starlight, To an Old White Pine, Sunset, Across the Fields.* Even the larger piano works, the sonatas, have not escaped. One is called *The Norse*, another *The Keltic*, another *The Tragic*. At the outset, then, one is impressed with MacDowell's status as a romantic composer, an impressionist, a writer of program music.

Music History must live to be vital, interesting.

The human struggles of its masters traced in music history are ever an inspiration to youth fired with musical ambition.

The Romantic Spirit

If we are to obtain more than a superficial idea of romanticism in music, we must go back in the history of the art a hundred or two hundred years. Every composer since the classical Beethoven (and he was not immune from it) has been infected at times with the romantic idea and has used the piano as a medium for its expression. Romanticism in music is not far removed from being the alpha and omega of musical expression.

To what extent, if any, does a composer hold to a definite program when composing music? Can he successfully imitate sounds of nature and animal life, such as the roar of the storm, sighing of the wind, purling of the brook, the song of birds? Composers have tried to do so. Is it a legitimate use for the art of music? To what extent is it possible and is it a legitimate use of music to attempt to tell a story or illustrate a story? Here again composers have tried to do so, notably Schumann in his *Carnival* and *Scenes from Childhood*. Is it possible with the assistance of a program for music to express thoughts, emotions, sensations, relaxation, pleasure, pain? Do composers without the use of a program ever attempt natural, intellectual or emotional states? If so, by what means, and how may the music lover be sure of his belief? Such questions as these, and others which arise in the minds of the thoughtful listener, the history of music considers. And it is nearly superfluous to add that the student, whether an executant or a listener, must have some well-balanced opinions on such phases of music, to appreciate it or express an intelligent opinion about it.

MacDowell, the Poet

In the study of MacDowell's life, we learn that he was a poet as well as a musician and that the titles of his verses are often as odd and characteristic of his mental attitude as are the titles of his piano compositions. Can you imagine such compositions as noted above being composed in the heart of a great city, or within the sound of the roar, the din, the clang of a city's activities? It is hardly possible; and they were not. They were written close to nature, under the shadow of mighty, primeval oaks on New Hampshire's hills, accompanied by the song of birds, the odor of flowers and growing vegetation, the cry of the eagle, the play of sunlight and shadow over hill and dale. His is music interpreting in tones the message that the blue bells gave him. It is the spirit of the wild rose, the water lily, the glen, the forest, the old log camp, the poem from another land and language, the memories of a well-nigh forgotten race. Is the meaning clear? Every composer brings to us a new world, the world of his own imagination, which is the result of nationality, environment, training, philosophy, religion. And it is the object of the history of music to re-create this world in written language that it may become the property of the student.

History gives us little definite information about individual compositions. That would be an endless task; for no two compositions make exactly similar demands upon the analytical powers of the listeners. Rather, as stated above, it trains the imagination and judgment to follow the flights of the composer into whatever realms appear legitimate to him. In order to enter into the full benefit of the study of the history of music, parallel historical reading should be required. An intimate study of the composer's personality, combined with a re-creation of the peculiar character of his period based on historical knowledge, can be fused into a glowing background for the appreciation and interpretation of his works.

Piano Lessons For the Vocal Student

By Russell Snively Gilbert

Most vocal students hear their music melodically. A few also hear it rhythmically. Only the artist hears it harmonically. The serious vocal student should work to hear it all three ways. Knowledge of the piano is the key to this work. Almost all of the great artists have a working knowledge of the piano.

Let the vocal student choose carefully a piano teacher who has worked with singers and understands their needs. The vocal student will need very little technic work at the piano as she will never play difficult accompaniments for herself in public and it would be time wasted to work up a fine piano technic. What she does need is a soft but clear tone that every voice may sound perfectly clean in her ear. This will require time and the closest concentration upon the way of producing the tone and the quality of the tone secured. She must also train her hand to become familiar with the different chord positions so that she can grasp them quickly without looking at the keyboard. She does not need to strengthen her fingers, but she must do enough technic to be able to control them.

A strong sense of rhythm must be developed. The student must realize that time and rhythm are two different things. In the old-fashioned waltz they stepped the time while in the modern waltz they glide the rhythm. The time is one, two three, but the rhythmic swing falls only on the one. The simple folk dances are the best material for this development. They can easily be read and the rhythm is strongly marked. The student should step the time and then walk the rhythm. At the piano the right hand should play the melody while the left hand swings the rhythm. Then the left hand should play the bass while the right swings the rhythm and the student sings the melody. To the advanced vocal student, working perhaps on Wagnerian arias, this may seem like going back to the kindergarten. It is, but when they actually get on the stage, they will be lucky if their pride receives no worse jolt than that. It is the willingness to give anything a trial and to go to any limit in music study that makes the great artist.

The student must understand the fundamental chords and be able to play them on the piano in all keys and in all inversions. She must be able to modulate at the piano in all major and minor keys. She must be able to play every scale one octave. She must be able to hear everything she does and to hear the roots of the chords she plays especially in inverted chords. Having played the dominant seventh chord she must be able to sing the root of the tonic chord that it will lead to. In singing this is often the only way in which she is able to get a new entrance especially when singing on the stage behind an orchestra in the pit.

The simple folk songs make excellent practice in this work at the piano. Take the simple "Folk Songs for Ten Fingers," arranged by Mr. Cady. After the student can play them in rhythm in their original key, she must take the melody and transpose it into a new key. Then she can add fundamental chords to it with the left hand getting in the chords by ear at first. After she has found them by ear, she must mentally find out just what they are. Then she must look at the accompaniment in the left hand and figure out how to transpose it to the new key. When she can play both hands together as they are written in any key, she has laid the foundation that will let her work out her vocal work in the key best suited to her voice without much mental effort on her part. When doing vocal practice or learning a new song or rôle, the student must keep her mind on her voice. As a result, unless she has learned and trained her mind and fingers to do the piano part without any mental effort, she often plays so many wrong notes and chords that it does her far more harm than she ever realizes. It is true that this piano work can be done by a paid accompanist, but often none can be found just at the time the singer needs him. Besides what the singer does for herself is a part of her. What is done for her by another is never really clear in her own mind. In the first study of a new rôle or program, the singer must do all the work herself that she may know every little detail. Then when she calls in her accompanist for the polishing, she will be absolutely sure of every move and her assurance will be felt by her audience when she finally appears before them.

Then the description of many of the orchestral instruments may be given. The learning of the first arpeggio offers the opportunity to explain the formation of the harp and the intervals played upon it. A beautiful left-hand melody suggests the 'cello, which may be described so that not even the childish eye or ear could mistake its identity when seen and heard on the stage. A hunting song of course would open the topic of the different horns. With a *cantabile* melody always impress upon the pupil that the hand must sing as much as possible like the voice. Certain bass notes echo the drum, and other notes a bell or a chime of bells.

Little by little trace the history of sound down through the ages, something in the following manner. One of the surest ways of making known our thoughts is by the human voice. Early in the history of mankind it was discovered that the voice was not enough to express our emotions. Man needed to make other sounds when he was angry, glad, or triumphant. So he pounded on metal; he strung rough cords across a piece of hollow wood; he made whistles of the reeds he found in the woods and piped upon them; and from all these, in course of time, evolved our drums and trumpets and violins and flutes and harps. Then, as man progressed in civilization, he trained his voice more and more to express his emotions, and for many years all instruments were used as an accompaniment to the voice. After this, as the instruments had greater care and skill bestowed upon their making, music began to be written for them alone. A short history of the evolution of the piano would be of vast interest to your pupils, as that is the instrument they are learning to play.

Keep these suggestions in mind during the lesson hour. They not only will serve to freshen the pupil's mind, if the actual piano work becomes irksome, but also will store it with qualities of true musicianship. And lastly, never, yourself, cease to read and study. Then you will always have a well of information from which to draw for your scholars.

Noiseless Practice Periods

By Grace May Stutzman

Many pianists constantly face the problem of how to accomplish the maximum amount of practice with the minimum annoyance to those about them. "The baby was asleep and I couldn't practice." "Grandma is ill. Please excuse Jane from her lessons for two weeks as we cannot have the necessary practicing done." Excuses of this character and import are altogether too familiar to the teacher of piano.

A practical remedy lies in the possession of a practice pad of medium weight felt, that can easily be made for any piano. The felt comes seventy-two inches in width at an average cost of two dollars per yard. Six inches is ample. Slits should be cut to allow it to slip over the braces that support the action of the upright piano, and small safety pins will assist at holding it in place.

The busy mother who seems to find no time to practice during the waking hours of her children and who dares not tempt Providence during nap-time, may keep her fingers in excellent trim by making use of this device. Finger gymnastics, memorizing of difficult passages which require many monotonous repetitions, technical studies, in fact, anything that comes to hand, may be done first with the practice pad, if necessary, until a certain amount of proficiency has been attained. This applies to the work of children as well as grown-ups.

Owing to the thickness of the felt which drops between the hammers and the strings, the action occasionally appears to have been tightened. This is really an asset rather than a liability, since it tends to develop a stronger technic.

During my student days I practiced at all hours, both day and night. In the next room a chum studied at the same time, and, although her lessons embraced the most intricate problems connected with a medical course, not once was she annoyed or disturbed by my practice. The hours she spent in her room I planned to use upon what might be termed "routine work," which left the remainder of the time for the polishing process upon the open strings. Countless situations will instantly present themselves to the teacher or student, wherein the use of the practice pad will greatly facilitate the preparation of programs or lessons.

The Small Town Choral Club

By Sidné Taiz

Mr. Arthur Bliss, the distinguished young English musician, who has been spending some months in America and is much interested in musical coöperation between the two leading Anglo-Saxon nations, has said some very pertinent things worthy of attention. Commenting on the prevalent choral singing of England, he says:

"Every town has one or more societies which meet every week for rehearsal, and prepare for three or four public concerts a year, which are attended by all the notables.

"Every village has its embryo Madrigal Society.

"Why should they worry about the capricious visits of virtuosi, when, with an able conductor, they can tackle a Bach Cantata? One can learn more and enjoy more by taking part in some such performance than by attending a whole year of concerts where others are doing the work—the fun is to be in the fight, not looking on!"

Hundreds of the smaller American communities could profit by falling in line with their English cousins in this particular endeavor.

The Dotted Note Problem

By F. Clark Perry

The dotted-note problem results from two causes. First, the dotted note represents a division of time of uneven length; and second, its manner of treatment in books and by teachers.

The usual definition runs about as follows: "A dot placed after a note adds to it one-half its original rhythmical value; that is, a dotted-quarter-note equals a quarter and an eighth (♩. = ♩♪), and so on. A second dot adds one-half as much time as the value of the first dot."

This seems to be a very obscure and unsystematic way of presenting the matter, in fact, entirely the wrong view of it. There is no good reason why the dot should not be considered in the same light as the hook. If the dot is to be treated as a character of addition, why should not the hook be considered as a sign of subtraction? Then we would have, "A hook attached to the stem of a note subtracts one-half the value of the note. A second hook subtracts one-half as much as the first, and so on."

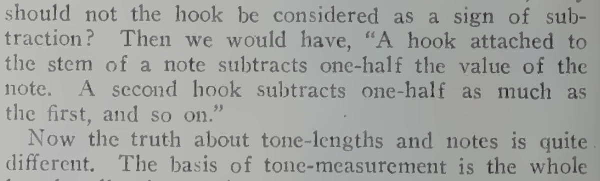
Now the truth about tone-lengths and notes is quite different. The basis of tone-measurement is the whole length, all others being reckoned from it and, therefore, should be named in accordance with their value as related to it. This plan is followed when considering the even lengths; so, when we come to the uneven lengths, why should we "fly the track."

A quarter note is so called because it is one-fourth (a quarter) the length of the whole. On the same basis, a tone-length which is three-fourths of the whole should be called a three-quarter note, and not a "dotted half." There is no such thing as a dotted-half, which is to say a long-half, the whole idea being unscientific. Then, too, the system leads to the inference that tone-lengths are named from the notes, whereas the exact reverse is true.

It is true that the three-eighth length is usually represented by a note with a dot (♩.); but that is no more a reason for naming a tone-length "dotted-quarter" than that an eighth-length should be called a "hooked-quarter."

The name of the tone-length should, in every case, signify its value relative to the whole; and, if this method were pursued by all, the "dotted note" problem would soon be solved.

A table of dotted notes and their names is here given.



To tell a child that a double-dotted-quarter note, for example, is almost as long as a half just enough shortened to allow crowding in a sixteenth at the end—may be a helpful expedient; but just as soon as the pupil is capable of comprehending arithmetical values, it should be taught the scientific names of notes.

Silence and Music

By FULLERTON WALDO

Fullerton Waldo has been since 1908 Musical Critic of the "Philadelphia Public Ledger." His theoretical training in music was obtained under Paine and Spalding at Harvard, where he performed in the symphony orchestra. He plays the violin and the viola, and, as a boy, was alto soloist in a vested choir. On many occasions he has addressed large audiences on musical themes. During the war Mr. Waldo was correspondent from several points between the English Channel and Constantinople. In 1920 he journeyed from Finland to the Persian frontier as a Near East Relief Commissioner, and in 1922 he crossed northwestern Canada to the Arctic Zone. He has also visited the Labrador coast and has cruised with Dr. Grenfell and has paid two visits to Panama, which were followed by articles in technical periodicals. His articles have appeared in several magazines, and he is the author of four books. A fifth is to appear in September. In 1920 he was given the degree of Doctor of Letters by Ursinus College, and he is a Fellow of the Royal Geographical Society.

"Show not forth words where there is a musician," says the Apocrypha, and the proper enveloping atmosphere of music is a sympathetic silence. But silence is not merely the necessary precedent condition; there must be soundless intervals now and then in the midst of the composition, when the instruments and voices cease, their scores marked "tacet." At the back of the orchestra the double-bass players stand with their arms folded, or draped gracefully over the looming instruments. Perhaps it is the drums or the harps that have nothing to do, or the horns secure a welcome breathing interval to rest the embouchure. All cannot perform the whole of the time; each must in turn be idle. In a chorus of singers, if every division was incessantly occupied the music would be breathless and restless. There would be a want of those dramatic contrasts due to the incisive impact of a note after a lull. In the almost impossible staccatos of the choral part of Beethoven's Ninth Symphony, no doubt the long and tedious wait for the singers enhances the appeal when at last they participate.

Silence Enhances Emotion

Silence, in the form of a rest or pause in the performance of music, is in the full meaning of the word an interlude. It is a positive contribution to the effect of the sound—an enhancement of emotion which the music is intended to convey. Again and again Bach, in the "B Minor Mass" or the "Passion Music of St. Matthew" or "St. John," works up to an enormous climax and then at the crest of the rise gives us a thrilled, supernal instant of stillness—intense, impassioned and exalting—as though to say (in Sir Edwin Arnold's phrase) that climbing thought can go no higher, and is now standing in the ineffable presence of the divine. Beethoven again and again resorts to a silence of this sort; in his symphonies, in his quartets, in his songs—among which "Adelaide" offers a salient example. Robert Franz, Schumann, Schubert and lesser figures in the world of song repeatedly leave in the melody or in the supporting chords that hiatus which is not an emptiness but a prolongation in the mind of the beauty and the meaning of the sound. Wordsworth's lines in "The Solitary Reaper" give expression to this idea:

> "The music in my heart I bore
> Long after it was heard no more."

White Spaces in Art

The cognate arts offer parallels to the emotional effect of the silences in music. Take, for example, an etching of Zorn. The white spaces in the picture are comparable with the "rests." Where the lines appear, there are the very tint and accent of life; and by the magic of the etcher's art where the lines do not appear, in the sentient "blank spaces," the surface seems likewise to have taken the impress of the artist's mind and hand. The unstroked surface has a certain soft, radiant glow as significant as the effect of the lines. But it is necessary to a contrast, in the art of the etcher, that there should be the blank areas in order that where the lines are made these darker regions may stand out in relief. White is pianissimo; black is fortissimo; and there are infinite gradations between. As there could be no sound, unless there were silence out of which it started, so there could be no darkness without light for its background. The artist, with brush, or pen, or etcher's needle, or graver's tool must know how much not to do—how much to let alone.

Silence in the Drama

To take a parallel from another art—who has not realized the significant effect of a "speaking silence" in a play? In John Drinkwater's "Abraham Lincoln" there is no more impressive moment than when Mr. McGlynn, impersonating Lincoln, stands in silent yet eloquent contemplation of the map of the United States. That silence has four dimensions—and in those dimensions there are included the length and breadth of the country. The suspense does not long endure. It does not need to be protracted to gain its effect. Its power is in the intensive thrill of a brief interval. By what Lincoln does not say, as he considers the immensity of his problem, and his duty to all of the people of the time, the impression of his utterances is enhanced.

John Barrymore's "Hamlet" is illuminated by brilliant flashes of silence—as Shakespeare meant his play and the psychology of its central impersonator should be. What are Hamlet's last words? "The rest is silence." All that could not be entrusted to the relative futility and impotence of words may be safely committed to the understanding, which, because it is inexpressible, abstains from speech.

FULLERTON WALDO

The actor lowers his voice, or is entirely quiet, because he knows his dynamic climaxes gain thereby. If he talked all the time at the top of his voice, he would be as the musician who plays loudly all the time. There would be no accent, no proper emphasis, no "tone-color." There would be nothing to choose between a foreground and a background; the waves of emotion would be without a crest.

Sans Jazz

I recently ate my dinner in a restaurant in New York which had dispensed with the noise of "jazz" as played by unholy combinations of instruments. There was no syncopated cacophony against which the voice must strain to hold its own in conversation. Instead, the sole music was that of a canary blithely singing. It is too bad to put a song-bird in a cage at all. If one waived that displeasing feature, there would be pure joy in the sound of the gentle, tender, pellucid song of the bird, instead of the crash of gongs, the klop of drumsticks, the clank of cow-bells, the squawking saxophone, the unearthly din of all the apparatus which the modern dance orchestra employs. The lights were dim as the tones of the bird were subdued. The diner ate his meal in peace, and gave thanks for the absence of the usual noisy concomitants of dinner in a city restaurant. Those who love music most are those who care least to have it profaned by extraneous sounds that are at war with music. They love the silence—as Matthew Arnold in "The New Age" loves the hush that follows a braying and bawling activity. They are fond of silence, not for its own sake merely, but because from the silence there comes the "beauty born of murmuring sound" which makes our earth man's purer, dearer dwelling-place.

The trouble with some of to-day's most advanced composers is that, obsessed by "the dominion of din," they do not realize the power of reticence, the majesty of silence. They seem to suppose that they must be making all the noise they can, all the time, with all the means at their command. In the words of the English humorist Graves, in his burlesque translation of Horace, they "worship the strenuous splendor of absolute noise." So that the poet breathes a fervent aspiration for a surcease of sound:

> "From trumpets that pierce like an arrow,
> And freeze all the brains in my skull,
> From cymbals that curdle my marrow
> I long for a merciful lull."

If the hearer is within his right in demanding an occasional respite lest the ear be surfeited, still more essential to the executant of music is it that there should be within the auditorium no vibrations that are at war with the tones he elicits and the emotional atmosphere he must evoke by the power of his art. I recall a concert of the Kneisel Quartet in Sanders Theatre, at Cambridge, a hall that like the Academy of Music in Philadelphia is almost miraculously perfect in its acoustical adjustments, so that the lightest whisper tells and the most delicate and evanescent filament of musical sound counts for its fullest value. The players were about to begin the slow movement of a Beethoven quartet, but Mr. Kneisel, with an infinitesimal shake of the head, signaled to the rest for silence. They waited until the audience wondered and became slightly restive. Just then the great bell of the clock-tower overhead, with a voice as great as that of Big Ben above the House of Parliament, in solemn reverberation began to proclaim the hour of nine, taking nearly half a minute to complete its annunciation. If Mr. Kneisel had not been forethoughtful, the effect of the first phrase of the music would have been ruined beyond repair by the jarring intrusion.

Paderewski's Rebuke

Often one is tempted to believe the listening ear the better half of music, and every musician does his best work for the audience that is in the happy state press agents delight to describe as "spellbound." It was at such an instant of enthralled and transcendental suspense that the famous and historic cry of the Boston woman rang out in the old Music Hall: "We fry ours in butter!" She has gone down to fame as the typical musical Philistine, but she has many sisters. Belonging to her unblest clan are those who bring a devastating cough into the concert room, those who make audible comment, those who enter a box after the music has begun and greet affably everybody in it, those who rise up egregiously to catch a train or meet a friend and slam the door as they go out. It was one such who led Paderewski despairingly to cry, as the chill wind streamed to the platform: "I am not an out-of-door pianist!" Of all important places for silence, the musical auditorium is foremost. It seems fair to say that he who holds a ticket to a concert has accepted a contract or made a compact to keep still. He becomes a fellow conspirator to produce such a soundlessness as that of Thomas Hood's sonnet on silence:

> "There is a silence where hath been no sound,
> There is a silence where no sound may be."

That description surely conveys the ultimatum as to stillness!

von Bulow's Advice

Charles Villiers Stanford in his little book "Musical Composition" emphasizes the value of rests to the composer, the performer and the listener. He cites Hans von Bülow's advice to players and writers to "let the air in," and as far as the hearer is concerned, his own words are worth quoting: "It has been truly said that some of the most thrilling moments in music have been the result of a dead silence (for example, the entry of the Dutchman in the second act of Wagner's opera, the silences after 'Hear and Answer' in the familiar Baal chorus of the 'Elijah,' and, perhaps the most impressive of all, the silence which succeeds the Trumpet Call in the second act of 'Fidelio'). To hit upon the right moment for this effect is no easy matter; it must never miss fire, and never sound like a complete finish. To do it successfully requires a dramatic mind; but all composers must be endowed with that gift if their music is to possess any measure of vitality."

The Radio in Music Teaching

By Robert Price

When the fad for reproducing machines and piano players swept the country, Miss C., contrary to many of her fellow teachers who believed that initiative in music study for many boys and girls would be discouraged by these mechanical contrivances, at once saw an opportunity for motivation. She secured records of many compositions which she could teach, installed her own reproducing machine in her studio and, whenever possible, made these master interpretations a part of her lessons. When she learned that a piano player had been purchased for the home of a pupil, she immediately found an opportunity for conferring with the parents and advising the selection of certain rolls likely to be of use in future lessons.

Miss C. is now finding new and even more interesting uses for the radio. To her other data, she has now added a list of the pupils in whose homes receiving sets have been installed. Each day, as a part of her preparation for the day's work, she scans the radio announcements in the morning paper for any composition which she may assign to advantage during the day.

For instance, she sees that Station XYZ will broadcast in their concert this evening, a piano group consisting of MacDowell's *To a Water Lily*, Godard's *Valse Chromatique* and a Chopin *Etude*. Here is just the chance to begin William B's study of MacDowell. He has acquired a sufficient technic, but tone pictures have always been more or less difficult for him to appreciate. *To a Water Lily* will be worked out in today's lesson and this shall be followed up by a radio interpretation, tonight. Mary S. is finding chromatics tiresome; Godard's beautiful work will be an inspiration. Robert R. will be ready for the Chopin *Etude* next week. Part of his assignment, today, will be to listen in tonight, as a preparation for taking up this master work. Down in Miss C's notebook go these suggestions, the name of the station and the hour of broadcasting. Nearly every week, there is some radio idea to be employed to advantage.

Miss C. also stimulates her music study by requesting her pupils to listen in for piano numbers which please them and which they wish to work out themselves in their lessons with her. The reports give her an idea of the type of music which appeals most to the different individuals, and aid in choosing proper study material.

An example of Miss C's alertness occurred the other day when she telephoned in at our home. "Please tell George, that the Tschaikowsky *Etude* which he is working on, will be broadcasted this evening at 8:30 from Station—. I am personally acquainted with the pianist on the program and am certain that George will get some valuable suggestions from hearing this interpretation." George listened in and went to work with an interest that we had not known for days.

Miss C. carries her radio idea even farther, utilizing it at the meetings of her Junior Music Club. The radio reports from programs heard since the last meeting, are an established feature. She tells me that this is one of the best aids she has in developing an appreciation of good music.

Piano Art and the Pianist's Age

Several of our pianistic heroes are nearing, or have even passed, the scriptural limit as to years. Opinions from inside the charmed circle are always interesting, and so it is refreshing to have Moritz Rosenthal's estimate of the elder artist's powers.

"A man of sixty should be able to play better than a younger man, provided he has lived wisely. It is considered nothing strange to expect the best thought from a writer or thinker at the age of sixty, and with as much right it can be expected of a musician. After all, a man at sixty is through with small points and technicalities and only heart and mind are needed."

"What is important is that the music be played in the right way, with the proper spirit, style, life, emotion and enthusiasm, whether it is with the notes or without."

—Ernest Bloch.

Stories For the Lesson Hour

By Leonora Sill Ashton

One hour a week, which is the generally allotted period for a piano lesson, is a very limited time in which to compress all we wish to impart to our pupils. Notwithstanding this fact, we must try to bring some outline of theory and history into each lesson.

At the earliest opportunity, when the first little pieces from Schumann's "Album for the Young" are given, put a note on the lesson slip, "Find out something about Schumann."

Carry out this idea with each composer as a work of his is given; and, when a scholar is old enough to do so, have him to write all these little histories in a note book and to keep them for reference. "The Child's Own Book of Great Musicians," by Mr. Thomas Tabber, is excellent to use as prizes and serves this branch of teaching in a very satisfactory manner.

In this connection try to fix the different schools of music in the scholar's mind, the classic, the romantic, and the modern or impressionistic, giving as few details as possible, but trying to make the matter clear. Perhaps the simplest way to present the subject of these different schools is to associate certain great names with each. Then, as the course of study pregresses, show the characteristics of these schools as expressed in the works of the composers. Out of this will grow naturally a slight acquaintance with form, and, if not an analytic and pedagogic knowledge, still a comprehensive and intelligent understanding of music.

To almost every form can be attached a story which will appeal to the child's imagination. A description of the minuet may be amplified by a picture of Washington and the stately ladies of his time. The history of the polonaise is full of suggestive anecdotes. The tarantella, with its strange connections, all of the dances, the cradle song, the barcarolle,—these have a mist of story atmosphere around them that cannot help but awaken interest.

Keeping the Child's Interest Alive

By Mary Alice Smith

Upon what do you depend to keep the very young pupil's interest alive? Do you sometimes let her put words to her little piece? Any little study with a name is to the childish mind "a piece."

Louise's "Course" contains a study called "Contentment." It has only sixteen measures, eight in the first part, and eight in the second, but it has form and character; it suggests a song, a quiet song like its name. Louise is not a musical child, but her interest has never lagged, and in order that it shall not, her teacher must keep wide awake.

"Did you ever attempt to put words to music?" I asked her one day.

"Oh no, Miss S——!" she answered, startled at the mere mention of such undertaking.

Quietly I opened the way by putting words impromptu to her little study, and explaining in a few sentences the *how* of it. A bright girl, her interest was immediately caught, and at her next lesson, with modest pride she handed over her first attempt at verse-making. It was surprisingly good, and pleased her greatly.

Minnie and Alice live in the same house and report together for their lessons. Timid little Minnie had in her Standard Graded Course a little study—or *piece*, (for it had a name!)—that almost sang itself. "Suppose," I suggested, "you write words to this beautiful little piece, and bring them to me?" Her color deepened as she assented, but with such evident doubt of herself that I felt almost sorry to have mentioned it. What was my surprise then, when on Friday the two quiet little maids came again and laid before me words so good that they really did them credit.

"Alice and I wrote them together," said Minnie,—and I could but smile as I pictured the two little heads bent together in their earnestness to make the lines fall right,—the meter, the phrasing, the rhyme; for more musical perception was called for than in Louise's effort. But in both "songs" the sentiment was refined and lovely, and the unconcealed pride of the three attested to the interest taken.

Pleasing the Little Folks

When little Margaret first arrived at the realization that C and E produce harmony, she felt the world of music opening to her. "Listen," she called rapturously to her mother, "to *this chord!*" And when her father came in, in the evening, she ran to show him. Fitting her baby fingers to the keys she pressed them gently, and bent her ear. *"Isn't this chord beautiful?"* she said. And amused as her parents were they took her as seriously as does her teacher, and respected her point of understanding, and appreciation.

Children must think they are doing something, and that their little work has real meaning and dignity. Too many elders regard the first months of study as only so much drudgery, and speak of it in the presence of the children in a way that is almost belittling. In some instances what a fortunate thing for a child if she could begin away from parental interference and so-called "help." Since this can seldom be, the teacher's skill is needed even more to awaken and preserve interest, and the surest way to accomplish this is by realizing and estimating the child's comprehension. Her simple work, treated with quiet and respect unfolds to her its beauties, whereas being rushed along into work beyond her grasp she comes in a short time to confusion and careless habits, and realizing that she is not doing well, to discouragement.

A mistake the teacher is apt to make is playing the little piece in a tempo and with a dash the child cannot hope to attain. To play to the childish understanding, quietly and not too rapidly, is far safer and certainly kinder, for only by this means can the very young mind grasp with clearness and comprehension, the meaning of the composer.

Creating Atmosphere

By M. E. Keating

The mere studying of notes, fingering, counting time, rests, and so forth, becomes for young students a drudgery, unless the imagination is awakened. After mastering the necessary details of playing correctly, then a picture should be painted, with particular attention to the finishing touches. With many talented pupils excellent results are obtained when mounted pictures of hunting scenes, meditations, boat scenes, folk dances, and so forth, are exhibited, of course an appropriate one, for illustration of the selection in hand.

Perry pictures, also art pictures that can be obtained at any art store, would be useful. The effect of concentration obtained in this manner is wonderful, and work takes on new life.

This leaves an impression of hidden beauty on the young mind, that is sometimes where we least expect to find it.

Schumann, the great musician, glorified little scenes in every-day life, by making the pictures in music, thereby writing classic gems that are imperishable. He must have concentrated on some picture or scene; why not young folks of to-day? Who knows but that there may be a great musician in some student class, who may become famous with the aid of music-dream pictures.

Rosenthal—Prodigy and Artist

Rosenthal's unusual musical precocity, as a mere child, attracted so much attention that throughout maturity he has had to combat the current impression that the prodigy exhausts his talent by developing certain powers beyond what the child physique can support. He tells thus how he avoided this misfortune:

"I have been wise for my own needs. When I was sixteen I gave up concerts, and studied hard for four years. As a mature man, I knew that if I was to keep my place as a foremost pianist, I must color my playing with new experiences and nuances all the time. In fifty years I grew, and the pianos I play on grew to be more orchestral, and so what I give to my playing today is a half century riper and richer than when as an infant prodigy I played before the Czar of Russia and as court pianist to the Queen of Roumania."

Rossini's Inevitable Sarcasm

By P. R. Fromiconi

No Sicilian ever sheathed a sharper stiletto than Rossini's sarcasm. He cared little how hard or how deep he struck. He had no patience with mediocrity; and when he was bored he retaliated with his bitter wit.

Once a presumptuous pianist-composer insisted upon playing one of his compositions for Rossini. The pianist shook his leonine locks and pounded the keyboard until he was bathed in sweat. It was a fearful piece and Rossini was both mad and flabbergasted.

"There," smiled the composer-pianist; "What do you think of that?"

Rossini retorted quickly, "Marvelous,—wonderful—you are greater than the Almighty Himself. The Almighty created the earth—but you—you created chaos."

The Teachers' Round Table

Conducted by PROF. CLARENCE G. HAMILTON, M.A.

This department is designed to help the teacher upon questions pertaining to "How to Teach," "What to Teach," etc., and not technical problems pertaining to Musical Theory, History, etc., all of which properly belong to the Musical Questions Answered department. Full name and address must accompany all inquiries

Popular Music

> A young woman of about twenty-five has come to me for lessons, who has had little previous musical experience. She cares only in a very superficial way for music—wants to learn to read readily at sight and play popular music. I'm not teaching this class of music, but am not in a position to refuse pupils. What would you advise?
>
> MRS. L. F. M.

Here is an opportunity for you to show your tact in arousing a genuine interest in music and in elevating the young woman's taste.

To accomplish these things, you must first of all give her interesting and attractive work to do. She will doubtless agree, if you explain the matter to her carefully, that a certain amount of technical drill is inevitable, in the way of scales, arpeggios and finger exercises. So give her small and varied doses of these, not allowing them to become a bugbear. Then, choose studies of a genuinely musical style, such as Burgmüller Op. 100 or Heller's Op. 47, showing her how each phrase may be given significance by the proper accent and melodic expression. Under the guise of studies, too, you may introduce pieces of an even higher type, such as those in Schumann's Op. 68, or the easier sonatas of Haydn and Mozart.

Meanwhile, for "pieces," let her have her light music—even ragtime, if necessary. A book of easy pieces may be used for sight-reading by assigning a certain amount for each lesson.

She will thus have a chance continually to compare "trashy" music with music of real worth; and in the end, if she is not utterly hopeless, the latter should win out. If you can only accomplish this result, you may congratulate yourself on having done the work of a real musical missionary!

Reasons for Summer Music Studies

> Would you give me a list of reasons why piano pupils should continue their lessons during the summer term? There isn't the slightest doubt in my mind about the value of such work, but I need definite, practical, persuasive arguments to convince some of my patrons.—M. C.

I heartily endorse your stand in this matter, and will cite the following reasons as especially cogent:

1. A long period of idleness, such as the summer vacation often stands for, is demoralizing and unnatural for children and grown-ups alike. How better may it be avoided than by the study of music, which combines exercise, recreation and pleasant mental effort?

2. The growth of summer schools and camps shows that parents and teachers realize the importance of organizing the vacation time to some useful purpose. "Satan finds some mischief still, for idle hands to do!" Regular lesson and practice hours will mightily aid toward defeating his satanic majesty's machinations.

3. During the winter, music is crowded into close quarters by the press of school studies. On the contrary, the long summer days offer unlimited time for practice, if only one has the good sense and proper guidance to turn them to profit.

4. There is less liability of interruption during the summer from severe storms, coughs and colds, measles and other such winter diversions.

5. The "soft summer breezes" and penetrating warmth of July and August are just the things to limber and relax the muscles, so that fingers and arms are in better condition for piano practice than at any other time of the year, and can consequently be more readily trained in the way they should go.

6. Inasmuch as teachers, as a rule, are not so driven with work in the summer, they are able to give more individual attention to their pupils.

7. The summer, with its outdoor life and brilliant natural coloring, is the period *par excellence* for inspiration in all matters pertaining to art.

8. Music, like all the arts, should be founded on the "play" impulse, which is at its height in the "good old summer time."

9. From the above considerations it follows that a pupil should forge ahead more rapidly in the summer than is possible at any other period of the year. I have proved this fact to my own satisfaction, at least, through many seasons of summer teaching. Indeed, I have often found that a pupil will accomplish more by five or six weeks of concentrated summer practice than the same pupil will accomplish in all the rest of the year put together.

If your patrons are not convinced by these arguments, I'm sure I can think up some more, for the woods are full of them!

Courses of Study

> What is your opinion of the *Mathews Graded Course of Piano Study*? I have a class and have been very successful, but have been criticized for using it straight through, instead of miscellaneous work. I use sheet music in connection with it.—B. V. S.

It is a fact recognized by all educators that the teaching of any subject is facilitated by the use of a well-compiled text-book. No teacher of mathematics, spelling, history and the like in our schools, for instance, would scorn the use of such a guide.

One reason, indeed, for the aimless and slovenly teaching of music, of which there has been (and, I am afraid, still is) an alarming amount in circulation, is the hit-or-miss, unorganized presentation of all branches of practical music.

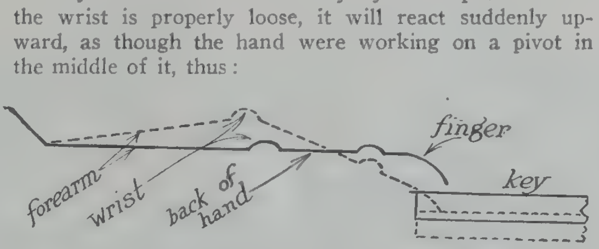
Fortunately there are now available a number of reliable text-book courses for the use of piano teachers, prepared by teachers of wide experience, who have devoted years to the best possible arrangement of the fundamental teaching materials. Since the Mathews course represents an excellent example of such a text-book, I certainly can commend you for using it; and I should not be disturbed by such unintelligent criticism as you mention. Naturally a clever teacher will introduce other material into such a course, and will vary it in some of its details to meet individual needs. But it will nevertheless fill an all-important office in serving as a basis for logical and well-balanced instruction.

The Hand Touch

> One of my pupils, an exceptionally talented young woman of twenty-two, came to me two years ago with no technic whatsoever. I taught her relaxation, at first with apparent success. This year, somehow or other, her hands and wrists seem more stiff, especially when she is practicing technic. Is her age against her? Or is it that she has arrived at the interpretative stage and age, but cannot accomplish what she wishes on account of defective technic?
>
> L. I.

Certainly at the age you mention the young woman's muscles should be at the acme of suppleness. Evidently something is the matter with her technic if it does not aid, as it should, rather than hinder her powers of interpretation.

She needs to cultivate with all her might the *hand touch*, which involves a throwing of the hand over and into the keys, with perfect relaxation of the wrist muscles. To develop this touch, first place the hand on the keys with the wrist loose, but the fingers curved and firm. Raise the second finger about a half-inch above the key and then sound the key by a sharp stroke. If the wrist is properly loose, it will react suddenly upward, as though the hand were working on a pivot in the middle of it, thus:



The unbroken line represents the original position, and the dotted line the position when the key is sounded.

Continue this exercise by striking eight times with each finger, taking care that the wrist invariably reacts upward with each stroke. Immediately after the tone is produced, arm, hand and fingers should resume their original positions.

In nearly all kinds of scale and arpeggio practice this hand touch should be used. The upward reaction on the wrist need not be so evident in quick playing; but it should always be present because, to prevent it, one is obliged to stiffen the wrist, which is the very thing we are trying to prevent. Stiff wrists are the cause of more trouble in piano technic than anything else of which I know.

Chopin's Études

> Will you kindly suggest the best progressive order in which to study the Chopin Études, Op. 10, Op. 25, and the three separate ones?
>
> K. McG.

Any such grading must be a more or less personal one, since what is difficult for some pupils is easy for others, and *vice versa*. The following order, however, will at least furnish a basis on which one can work. The grades will more or less overlap.

Grade 7

The three separate studies, in the given order.

Grade 8

Op. 25, No. 2; Op. 25, No. 9 (Butterfly); Op. 10, No. 6; Op. 10, No. 9; Op. 10, No. 3; Op. 10, No. 2; Op. 25, No. 4; (Inquietude); Op. No. 1.

Grade 9

Op. 25, No. 1 (Aeolian Harp); Op. 10, No. 12 (Revolutionary); Op. 25, No. 5; Op. 10; No. 5 (On black keys) Op. 25, No. 7 (Nocturne); Op. 25, No. 3; Op. 10, No. 7 (Toccata); Op. 10, No. 11.

Grade 10

Op. 25, No. 11 (Winter Wind); Op. 10, No. 8; Op. 25, No. 6; Op. 10, No. 4; Op. 25, No. 10; Op. 25, No. 12; Op. 25, No. 8; Op. 10, No. 10.

I may cite von Bülow as authority for considering Op. 10, No. 10 the most difficult of all. Another tough nut to crack, Op. 25, No. 8 he called "the most useful exercise in the whole range of Etude literature"

The Minor Scales

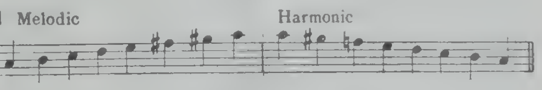
> Which form of the scales do you advise me to teach my pupils?—E. B.

Since we are after practical results, is it not wise to seek the answer by asking another question:

"What form of minor scales is most frequent in piano compositions?"

Careful research reveals the fact that in the great majority of cases the forms used are the *melodic* minor in ascending and the *harmonic* minor in descending. Hence the scale most thoroughly practical is the *mixed* minor. For example, here is the natural scale in its mixed form:

Ex.1

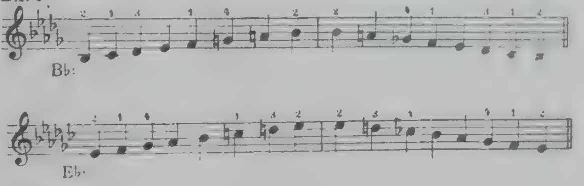


For the sake of simplicity, however, it is well to begin the minors with young pupils by a few scales, such as *a*, *e*, *b*, *d* and *g*, in the strict harmonic form. When the pupil has become thoroughly familiar with these, the mixed form may be substituted for permanent use.

While the mixed minors may seem somewhat puzzling at first sight, I have found no great difficulty in teaching them, if they are carefully explained to the pupil and are not administered in too large doses. Generally speaking, each scale uses the same fingering as the major scale which begins on the same key. This is the case with all those that begin on white keys. Exceptions in the case of those that begin on black keys are as follows:

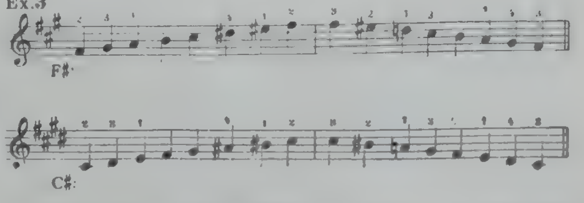
Left-hand fingering of B and E:

Ex.2



Right-hand fingering of F♯ and C♯:

Ex.3



The last two are most difficult of all, since the fingering of the ascending scale differs widely from that of the descending one.

The Musical Scrap Book

Anything and Everything, as Long as it is Instructive and Interesting

Conducted by A. S. GARBETT

SLENDER BUT LOVELY

Young musicians who want to play only "modern" pieces may read with profit the words of H. C. Banister, a once-distinguished English teacher. They are taken from his book, *Interludes*, compiled from seven lectures delivered between the years 1891 and 1897. "Beware of thinking that a century or two ago, the art (of music) was in its infancy," he writes, "or that those who then produced music were mere babes, or even—by a paradoxical perversity—estimating them as 'old fogies.' You see, or hear, or try to play, a modern piece of music, with many notes in a bar; perhaps very fine, but not because of its many notes. And then you turn to an older work with very few notes and think it slender, and almost imagine that the composer did not put down more notes because he could not think of any; the few expressed his clearly defined strong ideas.

"Did you ever observe, or think, how much there is, in small compass, and with small show, in one of Bach's two-part *Inventions*, which you may have almost set aside as dry little exercises, and would have been ready to join some one that I once heard say concerning the children who were *condemned*—mark you, not *privileged*—to play them, "Poor little things!"

GAY MUSIC MEANS HARD LABOR

The popular notion of a composer feverishly pounding at the piano in search of "inspiration" is not borne out by the following statement of Sir Arthur Sullivan of "Pinafore" fame, in a biography of him written by Arthur Lawrence. Sullivan may have lacked depth, but he did not lack spontaneity, gaiety and even tender pathos; not to mention sound musicianship.

"Of course the use of the piano," Sir Arthur remarks, "would limit me terribly, and as to the inspirational theory, although I admit that sometimes a happy phrase will occur to one quite unexpectedly rather than the result of any definite reasoning process, musical composition, like everything else, is the result of hard work and there is really nothing speculative or spasmodic about it. Moreover, the happy thoughts which seem to come to one only occur after hard work and steady persistence. It will always happen that one is better ready for work needing inventiveness at one time than another. One day work is hard and another day it is easy; but if I had waited for inspiration I am afraid I should have done nothing. The miner does not sit at the top of the shaft waiting for the coal to come bubbling up to the surface. One must go deep down and work out every vein carefully."

BEETHOVEN AND THE GRAVY

Thayer, in his Life of Ludwig van Beethoven, quotes Ries in the following incident, which shows Beethoven's irascible temper:

"Beethoven was often extremely violent. One day we were eating our noonday meal at the Swan Inn; the waiter brought him the wrong dish. Scarcely had Beethoven spoken a few words about the matter, which the waiter answered in a manner not altogether modest, when Beethoven seized the dish (it was a mess of lungs with plenty of gravy) and threw it at the waiter's head. The poor fellow had an arm full of other dishes (an adeptness which Viennese waiters possess in a high degree) and could not help himself. The gravy ran down his face. He and Beethoven screamed and vituperated, while all the other guests roared with laughter. Finally, Beethoven, himself, was overcome with the comicalness of the situation, as the waiter who wanted to scold could not, because he was kept busy licking from his chops the gravy that ran down his face, making the most ridiculous grimaces the while. It was a picture worthy of Hogarth."

CLARA SCHUMANN ON WAGNER'S MASTERPIECE

Clara Schumann, the devoted wife of Robert Schumann, was a great artist, but nothing if partisan in her predilections. In the following extract from her diary (dated Klosters, August, 1875, and quoted by Berthold Litzmann) we learn what she thought of Wagner's "Tristan und Isolde" when she first heard it. One should remember that the musical world of Germany was at that time divided between the Brahmsites and the Wagnerites. Brahms was a lifelong friend of the Schumanns, and owed his discovery to Robert's critical discernment. Brahms and Wagner themselves never approved of the partisanship displayed by their admirers.

"We went to 'Tristan und Isolde' this evening," she writes. "It is the most repulsive thing I ever saw or heard in my life. To have to sit through a whole evening, watching and listening to such love-lunacy till every feeling of decency was outraged, and to see not only the audience but the musicians delighted with it was—I may well say—the saddest experience of my whole artistic career. I held out to the end, as I wished to have heard it all. Neither of them does anything but sleep and sing during the second act, and the whole of Act 3—quite forty minutes—*Tristan* occupies in dying—and they call that dramatic! Levi says that Wagner is a better musician than Gluck! . . . Are they all fools or am I a fool? The subject seems to me so wretched; a love-madness brought about by a potion—how is it possible to take the slightest interest in the lovers? It is not emotion, it is a disease, and they tear their hearts out of their bodies while the music expresses it all in the most repulsive manner. I could go on lamenting over it forever, and exclaiming against it." . . .

Notwithstanding Mme. Schuman's violence, many musicians will say with the present writer, "Oh, to be eighteen again and hear 'Tristan' for the first time!"

THE BROTHERS RUBINSTEIN

In her *Memories and Adventures*, Louise Heritte-Viardot, daughter of Pauline Viardot, writes interestingly about Anton Rubinstein and his brother Nicolas.

"I first became acquainted with Anton Rubinstein when I was a child," she tells us. "It was not till some years later, when we were living in Baden-Baden, that I became intimate with him and was able to admire this divinely gifted musician. He had injured his knee at that time and was obliged to lie on a *chaise-longue* all day, a victim to *ennui*. Every afternoon I went to play chess with him, but sometimes I asked for music instead. His piano was just behind the *chaise-longue* so he had only to turn around and stretch out his arms. In this exceedingly awkward position he would play for hours at a time, always by heart and more exquisitely than he ever played in public. He was always a little nervous in public. But truly his playing was inspired."

Concerning Anton's brother, we learn: "Rubinstein's brother Nicolas played as well as he did, but he was not so well known, partly because his work as Director of the Moscow Conservatory kept him in that city, and also because he was generally in the condition known to the French as *between two wines*. No one who ever heard the two brothers play an orchestral score at sight as a duet could ever forget it. I believe they would have played with the same ease and intelligence if the music had been placed before them upside down.

"Trouble had driven Nicolas to drink, for his wife had deserted him. I was once at a party in St. Petersburg when a young lady asked him if he had any children. 'No,' he answered, 'but my wife has.' In spite of his lucrative appointment he never had a penny in his pocket. He gave all he had to poor pupils, his money, his watch, his clothes. But it was impossible to keep him from drink, and he died from delirium tremens."

REMORSELESS EFFICIENCY IN MUSIC

"Do you people in the metropolis have Sousa and his band?" asks Howard Mumford Jones, in *The New Republic*; and—answering his own question—"If you do, I don't believe you know anything about it." Mr. Jones knows the American small town and how it feels about Sousa. He is wrong, however, in supposing we of the metropolitan centers fail to appreciate Sousa, and for the same reasons. As he says: "We don't want any nonsense about our music. It isn't American to put on airs. Sousa knows that. He knows just how we feel."

To this he adds: "What we secretly admire about Sousa is his remorseless efficiency. His program just clicks like a great shining machine. One bow to the audience—and none of your foreign bows either, but a stiff American bow as if he were just as uncomfortable about bowing as we are—and then he turns around and without any foolishness about getting ready, the band begins. And when the soloist comes, he (or she) steps forward and plays or sings, and bows, once to the audience, once to Sousa, and retires. Right at the edge of the platform Sousa calls her back with a glance, and then there is an encore—Beethoven's "Minuet" or "Dixie." Sousa watches her all the time. Sometimes we can even see Sousa telling her to go back. Sousa is boss. We like that.

". . . And those white gloves of his. We like them, too. They're not obtrusive—like a dress suit—but they show that he's the conductor and has put them on for our benefit. There is subtle flattery in that. Besides, they keep the music clean.

". . . How long has that man been writing marches? Forever? We hope so. We don't think he will ever die because he is ourselves. He is an institution with us like Ford cars and the school reader and the Fourth of July. He is living proof that America is all right."

COULD YOU DO THIS?

George Henschel, in his book, *Recollections of Johannes Brahms*, gives the following incident which shows how quick was the ear of the great composer and how swift his musical intuitions.

"Last evening we sat downstairs in the coffee-room, having supper, when suddenly someone in the adjoining dining-hall began to play Chopin's *Study in A flat* on the piano. I sprang up, intending to put a stop to it, and exclaiming, '*Oh, these women!*' when Brahms said, 'No, my dear, this is no woman.' I went to the hall to look, and found he was right. 'Yes,' he said, 'in this respect I am hardly ever mistaken; and it is by no means an easy thing to distinguish by the sense of hearing alone, a feminine man from a masculine woman!'"

THE HELPLESS BEETHOVEN

A vivid picture of Beethoven's home surroundings is presented by Ferdinand Ries, as quoted by Thayer in the latter's famous biography of the noble-minded but ill-kept master:

"In his behavior Beethoven was awkward and helpless; his uncouth movements were often destitute of all grace. He seldom took anything into his hands without dropping and breaking it. Thus he frequently knocked his ink-well into the pianoforte, which stood near by the side of his writing-table. No piece of furniture was safe from him, least of all a costly piece. Everything was overturned, soiled and destroyed. It is hard to comprehend how he accomplished so much as to shave himself even, leaving out of consideration the number of cuts on his cheeks. He could never learn to dance in time.

"Beethoven attached no value to his manuscripts; after they were printed they lay for the greater part in an anteroom or on the floor among other pieces of music. I often put his music to rights, but whenever he hunted something, everything was thrown into confusion again. I might at that time have carried away the original manuscripts of all his printed pieces, and if I had asked him for them he would unquestionably have given them to me without a thought."

If Beethoven was careless of his manuscripts after they had been engraved, however, it is fair to him to remember that he was very meticulous in his actual writing of them. No detail escaped him, and he was most careful in reading the engravers' proofs, as his letters show. Very few errors have crept into Beethoven's works, for which he himself was responsible.

The artist strives to perfect his work; the artisan strives to get through it.
—W. G. Gannett.

SUPERSTITIONS OF ROSSINI

King Louis Philippe of France had given Rossini a beautiful repeating watch. Rossini, proud of this gift, carried it in his waistcoat pocket for many years One day, while he was showing it to some friends, a man who was passing by accosted him and said, "Rossini, you do not know the secret of your watch although you have carried it for so many years. Will you permit me to disclose it to you?" Rossini, with a knowing smile, handed it to him. The unknown man touched a spring and the bottom of the case opened. The startled Maestro saw his own portrait in miniature surrounded by an enameled inscription, in arabic characters The unknown, who was the maker of the watch refused to tell Rossini the meaning of the inscription although Rossini pleaded with him to do so. From that time Rossini conceived such an invincible dislike for the watch that he put it away in a box where his heirs lately discovered it, covered with dust.

WATER LILIES

A graceful movement in modern vein. Play in rhythmic style without hurrying the pace. Grade 4

RUDOLF FRIML

The Singer's Etude

Edited for June by

ALEXANDER HENNEMAN

Noted Vocal Expert of Washington, D. C.

It is the Ambition of THE ETUDE to Make This Voice Department "A Vocalist's Magazine Complete in Itself"

Action in Vocalization

By Alexander Henneman

ONE fact stands out as the most important in the study of vocal action, and that is, that all action of the voluntary muscles is the result of a psychological cause. Bearing this in mind, and the fact that action in the organ of speech is instinctive, we must conclude that the causes that bring about singing are primarily psychological. Psychology is, therefore, first in importance. However, when entering the interesting field of psychology we must not overlook the physical, for, like the poor, it is always with us. Though the speculative domain of psychology is one of deep interest, none the less it is well to remember Pat's statement when he was asked, would he like to fly into the air: "Sure," said Pat, "I care not how high you take me into the heavens in an aeroplane, so long as I can keep one foot firm on the ground." So with us. Let us keep one foot firm on the ground of the physical part of the voice and view from there the more attenuated psychological manifestations expressing themselves in voice action.

The Sense Organs

The sense organs employed in singing are not only sight, hearing and touch, but also muscle-sense is involved. By the impressions coming in through these organs and by the sensations resulting within them, perception results and thus the brain is stimulated into forming varied associations of sense and motor activities. Concepts are formed and messages are sent over the nerves to the muscles, which, thereupon, perform the act.

The progress from impression to expression and the judgment by the mind on the sound that is produced is shown in a general way by the accompanying illustration. The illustration shows at A, the picture of the notation and syllable. The eye (B) perceives the impression of the note and the word: and, the vibrations set up in the organ are transmitted over the nerves to the visual center in the brain (see C). Along with the picture of the notation there springs up in the aural center a mental impression of the desired tone and word. (A *recollection* of these sounds might better designate the act, for only in the memory is stored the knowledge of what the tone C sounds like, and how the word expressed by the letters, *a* and *h*, sounds).

After the picture entered the visual center, and the aural center was brought into action, the association areas also became active. The different impressions of word, tone, pitch, and quality, and the immediate sensations as well as the impress left by former sensations, are welded in the association areas into a unit. That is, all of these things are unified by the mind into a concept. Flashing through the motor region the "thought-force" is sent over the motor nerves along the spinal column to the muscles that control breath and speech, and the voice sings the "ah". (See C and D).

Vocal Organs Without Volition

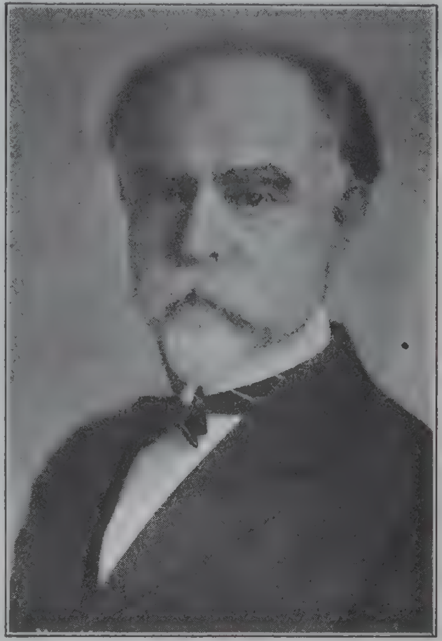
Before we go farther let us apply these findings to vocal study. First and foremost, we must realize fully an important fact, and that is, that the organs have no volition of their own. They accept anything and everything and send it on as it is presented to them. They make no corrections or alterations. They improve nothing. They mirror what the mind conceives the thing to be, not what the thing might actually be. The syllable is "ah" but if through carelessness I *think* it is "oh," the eye so accepts it and *sees* "oh." The pitch of the C is 517 3/10 vibrations. But if I am thoughtless and conceive the pitch at 500 vibrations, the aural sense accepts my incorrect pitch, and so sends it on over the nerves to the association areas. These build up the concept with this pitch and transmit it over the motor nerves to the vocal chords. These adjust at this pitch and—my tone is off key.

Only what the mind conceives can the organs reproduce; only what occurs within the brain, passes over the nerves and finds expression through the action of the muscles.

Muscle Sense

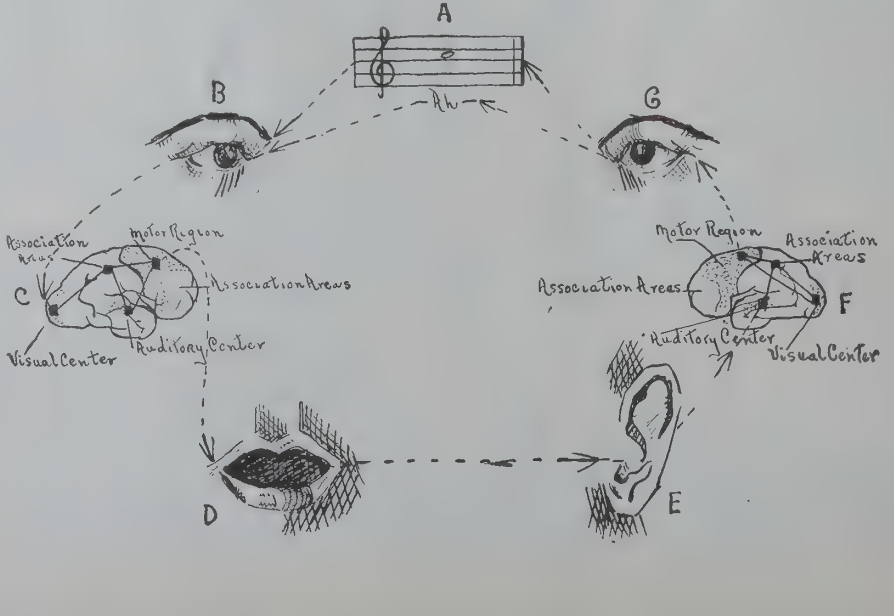
The question might be asked, "If the concept of the tone and quality is correct and distinct, will this suffice to induce a proper rendition?" No. The "thought-force" must travel from the brain to the muscle and on the way it may have to overcome interference in the form of poor poise or rigid muscular condition in one or more organs or in some parts of the body. Here *muscle-sense* comes into play. The singer must develop his muscle-sense until he is able to feel the slighest rigidity in any muscle in the body. The muscles are all connected. Therefore, a tight muscle in the back of the neck may create imperfect action within the larynx, though the latter be properly poised and would function correctly if the extraneous muscle did not create an interference. But even in this, concept plays a role. If I conceive within myself ease of poise and ease of action I create at once a condition that will induce ease in all the parts. If I conceive a fine adjustment of all parts, that concept will so act on the body that a better adjustment between members results. If I conceive the tone as being easy to sing, I create within the body conditions that will make an easy tone possible. But if I do the reverse, and, with a frown on my face, a clenched fist and a rigid body, I expect the tone to be hard to produce, then the condition I have set up through this unfortunate mental attitude, will so react on the body that the latter will be able to produce the tone only with effort and strain. "As a man thinketh in his heart, so is he!" As I conceive the tone so it is.

We have traced the progress of the *impression* in the organ of sight, to the *expression* by the organ of speech. Cause and effect, therefore, have taken place. But we are only half way on our tour. We have produced the tone; but was it right? was it correct? did it reproduce the intended effect? These are the questions that now must be asked if our study is to have value.



ALEXANDER HENNEMAN

Let us look again at the diagram, at E. The process is much the same, now, that the "ah" is *heard*, as at first, when the note and word were *seen*. The tone enters the ear (E) and from there is transmitted to the aural center in the brain (F). In the brain the aural, visual, motor and association centers again function and recreate the original image for inspection and judgment. The motor center acts on the nerves and these readjust the eye (G) so that it sees again the picture at A. Thus the circle is completed, and we are back again at the originating source.



That in a general way describes the mental and physical action. But, for the vocal student, a more detailed tracing of the process and the lessons to be learned therefrom is desirable. For this, a return is in order to the point when phonation took place. When "ah" was sung by the voice the vibrations of the sound traversed the singer's ear and entered the aural center in the brain. The same center that at first mentally *conceived* the effect, now actually *hears* the sound. At once the mind sits in judgment on the deed. Is the tone which now strikes the ear as *actual* sound, the same as was the *imagined* tone that sprung up in the mind, when the effect was first conceived? Is the vowel I hear "ah" or is it "awe"? Is the tone true to the pitch? Has muscle-sense warned me of incorrect action at some point? Has improvement taken place? These are some of the questions that should arise in the mind of the student.

Good Tone Devoid of Muscle Sensation

At this point attention to muscle-sense is in order. A correctly produced tone is devoid of muscle-sensation. Just as the knowledge of having a heart does not enter the consciousness of the individual if the heart functions properly, nor proper digestion bring to his notice the fact that he has a stomach, though both heart and stomach are acting healthily and vigorously; so too, a correctly produced tone is in effect a spontaneous, unconscious muscular act that in no way leaves an impress on the muscle-sense. If, then, in emitting the tone, pressure is felt, let us say, about the left lower ribs, or, if the root of the tongue obtrudes itself into the consciousness of the singer, then breathing, in the first case, and articulation or placement, in the second, were faulty. Had they been correct the action would have been so smooth and natural that no sensation would have been experienced in the acting muscles.

The Accomplished Deed

We note, then, that the first part of the deed, that of *seeing and doing* is the active element (see illustration A to D); the second part, that of *listening and judging,* is the critical element in the singer's equipment. (See E to A). When phonation took place, that is, when *cause* became *effect,* the critical faculties came into play. On them and on their acuteness depend advancement or retrogression, success or failure. In the second half of the circle is the pitfall for most vocal students. Their interest is keen and endures from impression to expression, but the criticism that should follow is lacking. They have produced the thing demanded, and, as far as they are concerned, the deed is accomplished. After that their *gray matter* no longer functions. But this part is as vital as the first. By it the concept is improved and the memory enriched with various shades and qualities of tones and vowels. Discrimination is developed and hearing is improved. All of which means progress in the art of singing.

In view of these findings the vocal student who is serious in his study must bear in mind the following:

1. He must know what he wants to sing, and this knowledge as to key, pitch word, time, quality, all tonal features must be definite and clear in his mind.
2. He must be receptive and at ease so that the impressions may enter, in all clarity and distinctness, by way of the sense organs.
3. He must attend solely to singing to the exclusion of all other matter so that the association areas find no extraneous matter cluttering up the brain that must first be eliminated or be taken up by them and incorporated into the concept; thus destroying, or at least corrupting, the origi-

al impression and creating faulty action n the voice members.

4. His poise must be correct and the ody at ease. All the members must be lert to receive and carry out the messages coming to them from the brain.

5. His mental attitude must be expectnt, confident and assured, so that no egative influence warps the enthusiasm and thus constricts the easy and direct co-ordination between mind and muscle.

We realize then, that the mental is primary; the physical secondary. Attention to the physical is useless if the fundamental cause is faulty. But, as stated in the first part of the essay, the physical must be considered, but always as a correlative and subsequent to the primary cause that sets it in motion.

Hearing Your Voice From Without

By Alexander Henneman

Beginning at the *tympanum* (the technical term for the ear-drum), a tube extends from each ear into the pharynx. These two tubes are called the Eustachian tubes. Their function is to counteract the atmospheric pressure from without on the ear-drum, by supplying an equal pressure from within and thus stabilizing the drum-head. Unless a catarrhal condition has clogged them, these tubes are always open. They act as conductors to the inner-ear of all sounds made by the individual's voice. This fact can be readily proved by the following simple experiment. Hold a vibrating tuning-fork about ten inches from one ear and then place the finger lightly into the other ear-hole thus closing it. If, now, the finger is alternately withdrawn and reintroduced, the increase and the decrease of even so faint a sound is readily observable. The phenomenon occurs as follows. The vibrations produced by the fork enter the near ear and striking the drum are conducted to the brain. These sound-waves progress along the Eustachian tubes and also by bone-conduction to the other ear and are then reflected by the closing finger tip.

No One Really Hears His Own Voice

If the quality of so faint a sound is markedly altered by the mere closing and opening of one ear-hole, how strong must be the effect of a tone that is produced in the throat, the sound-waves of which set the whole bony frame of the head into vibration, and freely entering both tubes, strike unobstructed against the ear-drums? No one, therefore, really hears his own voice as it actually sounds, for his own voice is heard both from within and without, while the voices of our fellow-men reach us solely through the outer ear. Consequently, the quality heard by the individual in his own voice differs from that heard by the listener.

This rather startling fact is demonstrated by the slow-returning echo such as is found, for instance, in the Pantheon at Rome. The return of the echo is slow enough to allow the sounding of a few syllables. Invariably the subject is surprised when the echo sends back his voice. "I did not think my voice sounded like that," is invariably the comment. But the echo of the voice of one's companion, whose voice-quality is known, causes no surprise. One expects the echo to return the other's voice in the quality one knows it, and so it actually does come back. But one's own voice seems different. The explanation is that we get the sound through the inner and outer ear, while our companion's voice comes to us only through the outer ear.

A singer or speaker, therefore, never knows exactly how his voice sounds to others; and yet he is to judge his tone as it affects others. It is quite a problem. The art of hearing his own voice as it sounds to others, can be developed to a high point by the singer or speaker if he strives at all times to hear the tone, not as it resounds within his head but as it sounds out in the studio or auditorium.

Suggestion plays an important rôle in this development. The student while singing should not listen to himself, but should listen to the voice that comes to him from the auditorium. In other words, the act is a purely impersonal one. I do not listen at all to my voice; I listen to the effect my voice is producing in space. I suggest to my student that he listen, not to his own voice, but "to listen to the effect produced by the singing of that voice sounding in the auditorium."

This suggestion, I am sure, counteracts considerably the effect of inner vibrations. To stop fully the inner-hearing is not possible. But, since we can close our ears to disturbing sounds, so too can we shut off to a great extent the consciousness of inner-sounds and thus intensify the hearing of the outer ear. I am sure much of the disappointment the teacher experiences in not being able to get his pupil to recognize the correct quality of a tone, lies in the fact that the student hears the model solely from without, while he hears his own tone from within, where contact is direct and immediate.

Keen Attention Necessary

Trying to hear one's voice from without has a salutary effect on tone-production. The attempt to hear the effect produced out in the auditorium brings the tone itself more keenly into the consciousness of the singer. Not only that, but, since the tone must have carrying quality, or it will not return to the singer, he will unconsciously supply vitality to the tone, for instinctively he feels that a lifeless tone cannot travel far out and also return. The suggestion, therefore, of tone that must be heard by the singer himself, so clearly and distinctly that it obliterates all other sounds within the head, induces conditions that make so desirable a tone possible.

The good results are many. The ear is trained to hear the tone vibrate in space unimpaired by vibrations in the head. The keen attention necessary to hear this rebounding tone makes for tonal-discrimination and a finer concept of vocal tone. The improved concept induces a more perfect adjustment, and a finer tone of greater carrying quality results.

SECULAR DUETS
For all Voices
A New and Worth-While Volume for Singers

SINGERS possessing this volume are well prepared for duet concert singing or for pleasurable moments of recreation at the keyboard with other singers. Practically all combinations of two voices are covered and in this one hundred and two page volume there is a wealth of carefully selected, good duets.

Price $1.25

THEODORE PRESSER CO., PHILADELPHIA, PA.

"L'heure exquise!"...that exquisite hour before you sink to sleep!

. . . that time which truly belongs to yourself! . . . you go quietly about, thinking pleasantly of what has happened this day . . . and, dreamily you plan for tomorrow. You want, now, to do soothing things . . . to fold away a few trifles . . . to read a page or two of your favorite author . . . to brush your hair lazily before the mirror . . . and,—"oh yes, . . . this is my night for the skinfood . . . how I love these Valaze things!" you think. So, you do the most soothing thing of all . . . overlay, caressingly, your face and throat with Valaze Beautifying Skinfood . . . and slip into sleep . . . while the silvery "skinfood" weaves into your skin a silken feel,—and conjures away any roughness of texture,—discoloring blemish or freckle,—and takes care of your skin generally so that your face may hold its own with the best.

A dollar, two-fifty or four-fifty, according to size of jar, and to be had at leading stores or direct. Nor should you be without my booklet, "Beauty for Every Woman," which my secretary will be glad to send you.

What the Frank Piano Tuner told Mrs. Johnson

"Mrs. Johnson, I've worked on all kinds of pianos, but I never saw a cheap one that gave any real satisfaction. There's always something wrong with them. The quality's not there. Satisfaction requires quality, and quality costs money. But it's worth it. You never save a thing by buying a piano because it costs less."

To be a fine piano, the quality must be there. That's why in building Weaver Pianos, we have devoted our every effort not to quantity production, not to price reduction, but to giving the Weaver Piano quality through and through.

Own a good piano—buy a Weaver. Convenient terms are easily arranged, and a liberal allowance made on your former piano. Write us for the name of the Weaver dealer nearest you and ask for the Weaver Catalog. Weaver Piano Co., Factory and General Offices: York, Pa. Weaver, York and Livingston Pianos and Player Pianos.

Songs for the Beginner

By Alexander Henneman

When to give the first song? That is a question often asked by the young teacher. As in other subjects, so in the study of singing, there are a number of opinions about the advisability of giving songs. Some teachers drill for a long period on exercises and tone-production before permitting the student to take a song. I believe in the early use of songs; but they must be chosen with the greatest care, for they can become a source of great help, and also can do immeasurable harm. My reasons for the early use of songs follow.

A song with its story rouses the interest of the pupil in his studies. He has an outlet for expression hitherto denied. And we all know that unless interest exists little progress can be made. Not only that, but the student's "interests" will soon be outside of the teacher's studio; if no interest is supplied within.

Completed Vocal Art

Song is the completed vocal art-work. It embraces everything and therefore makes demands on musicianship as does no other form of student-activity. Rhythm, melody, harmony, form and speech are all united in this complete art-work. In it the student sees assembled all his previous efforts in tone-forming, in technic, in rhythm, in complete technical delivery. Teacher and pupil more readily become aware of weaknesses in this form of vocal work than in any other.

Singing is multiplied, intensified and idealized speech. A song, therefore, is speech of a higher type, but it is not a strange or unnatural thing for the individual to carry speech on to that higher plane, and to sing. In songs he develops his imagination, without which no real progress is possible. For imagination is necessary not merely for the general outline, but also for the minute qualities of vowel sounds and for their coloring. A vowel in a sad word will have a different coloring than the same vowel-sound in a cheerful word. These differentiations are the result of the imagination, which supplies a picture or an effect to the individual word, that gives a distinct color to the vowel sound.

The things that must be considered, in the first easy songs for the beginner, are: (1) breath, (2) range, (3) articulation, (4) intonation and (5) accompaniment support.

Breath. The beginner has only a short breath and no perfected control of that. The songs, therefore, must have short phrases. Points for breath must be many and close together. It is also advisable to find songs that have phrases for the piano alone, enabling the singer to get his breath restored to normal life-breathing and to quiet any irregularities that may have arisen.

Range

Range. No song should touch the highest nor the lowest tone of the singer's range. If his exercises and drills have developed the range from D flat to high A flat, then the song must not have a tone lower than E flat nor higher than F. To give a song that touches one, or both extremes of the beginner's acquired range, means, without fail the destruction of that range because placement is lost. The separate phrases should be transposed one tone higher and one lower than the range in which they occur. The singing of the phrase four or five times in half-tone transpositions and carrying it above and below the actual range in the song not only perfects the placement, but also gives confidence and assurance. "Well," says the singer, "here comes F, but I have sung the phrase transposed to G, so this will make no trouble." And it makes no trouble, with such preparation.

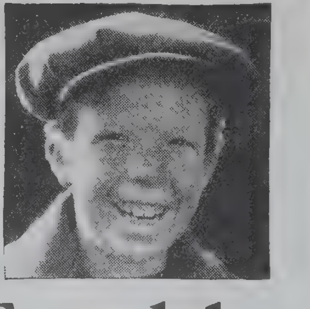
Articulation. Articulation of certain sound-combinations is not easy in the lower and middle ranges. On high tones all articulation is difficult. Furthermore, the pupil is not a finished artist and must be guarded against strain and undue effort. It is imperative, therefore, that the words be changed if they cause the least trouble. If, for instance, on a certain tone, the word "love" is difficult to sing and "heart" is easy, then, for the time being, "My love art thou" should be changed to "My heart is thine." It will be found that when once placement is attained on the substituted word, the proper word will often slip in at the first attempt, without loss of quality, and in a fine placement. The seemingly insurmountable difficulty is overcome without actually working directly with it. Should, however, the poor word "love" have been forcibly used, wrong habits are established and teacher and pupil may discover that the word, that once made trouble only on a high tone, is now difficult in all parts of the voice.

Intonation

Intonation. No difficult intervals, nor harsh dissonances must occur in these first songs. These songs are not sight-reading and ear-training problems, they are intended solely for voice-development; and all serious demands on musicianship, on intonation, and the like, must be foresworn. These things come later when a certain mastery is achieved and the production of vocal-tone has become more or less instinctive. Then problems of this kind are in order, but not in beginner's songs.

Support. The piano part must support the voice and support it well and fully. By support, in easy songs, I mean that voice and accompaniment go hand in hand. Not too many counter-melodies, no irregular or disagreeing rhythms, no vague harmonies must fill out the supporting medium. Rather must the accompaniment move along closely and intimately in type, mood, spirit, and rhythm with the voice part. The climax in the voice must be well sustained by the accompaniment, so that the singer can feel the accompanying support upholding the voice throughout the climax-phrase.

The reader will note that these beginner songs are evidently not by Brahms, Debussy, or Dukas, nor even by Schubert or Schumann. They are not. They are of a lighter calibre and will hardly thrill a good musician-teacher. But, that sacrifice must be made; for the classic songs are, with few exceptions, no pabulum for infant vocal-artists. To them must be given in their early stages, easy, digestible sweet-meats. The teacher must pocket his artistic inclinations and teach these simple songs with enthusiasm and find his pleasure and satisfaction in the vocal advancement of his pupil. Before long, no strain having come in the pupil's voice, a higher type of song is taken and eventually he is studying songs whose musical merit brings pleasure to both teacher and pupil.



Mickey Daniels is one of the juvenile stars appearing in "Our Gang Comedies," produced by Hal E. Roach and distributed by Pathé

Freckles

AMUSE YOU IN THE MOVIES

But it's not so funny to have them in real life. Mickey Daniels can afford to let others laugh at his freckles—he's paid for it. You can't.

Your freckles always attract attention, no matter how well you dress. Get rid of them!

Quickly and surely they will disappear if you use Stillman's Freckle Cream. Double action—not only are your freckles dissolved away, but your skin is whitened, refined and beautified. Guaranteed to remove freckles or money refunded. Most widely used preparation in the world for this purpose. Snowy white, delicately perfumed, a pleasure to use. Two sizes, 50c and $1 at all druggists.

Write for "Beauty Parlor Secrets" and read what your particular type needs to look best. Full of beauty treatments, make-up hints, etc. If you buy $3 worth of Stillman toilet articles in 1924, we will present you with a beautiful large size bottle perfume free. Send for booklet now.

As a means of contributing to the development of interest in opera, for many years Mr. James Francis Cooke, editor of "The Etude," has prepared, gratuitously, program notes for the production given in Philadelphia by The Metropolitan Opera Company of New York. These have been reprinted extensively in programs and periodicals at home and abroad. Believing that our readers may have a desire to be refreshed or informed upon certain aspects of the popular grand operas, these historical and interpretative notes on several of them will be reproduced in "The Etude." The opera stories have been written by Edward Ellsworth Hipsher, assistant editor.

The Snow Maiden, "Snegourotschka"

NEGOUROTSCHKA (pronounced Snay-goo-sch-kah) was the third of Rimsky-rsakoff's fifteen operas. The first, which nown as *Maid of Pskov,* was produced 1873 at Petrograd; and the last, *Le q d'Or,* was done for the first time in scow in 1910, two years after the com-er's death.

ikolai Andreyevitch Rimsky-Korsakoff ten spelled Rimsky-Korsakov) was n at Tichvin, Government of Novogrod, rch 18, 1844. His parents were mem-s of the Russian aristocracy; and, al-ugh the child showed marked musical nt, so that he commenced his piano les-s at the age of six, he was not expected follow the career of the musician, but sent to the government Military Acad-when he was twelve years old.

ave for occasional lessons taken during college days, his musical nature re-ed little training until his contact with akirev, in 1861. Balakirev, perhaps more n any other, sought to influence the ing men of Russian musical art along lly national lines. It was through him t Rimsky-Korsakoff came to meet the composers, César Cui, trained as a military engineer, Modest Mussorgsky, a graduate of the Petrograd Military Academy, and Alexander Borodin, chemist and surgeon. With most of the musical giants of Russia, music has been an avocation, often pursued until late in life before it afforded them a livelihood.

Rimsky-Korsakoff is credited with having written the first Russian symphony, truly national in type. This was given its premiere in Petrograd in 1865. The composer's gifts were soon recognized and he retired from the Navy to devote his life to music.

The *Snow-Maiden* is based upon an old folk-tale made into a libretto by Ostrovsky. It was given its first performance in St. Petersburg in March, 1882. Its first presentation in Paris occurred in 1908 and its addition to the repertoire of the Metropolitan, two years ago, brought to it a decided American success. By many it is regarded as Rimsky-Korsakoff's most inspired work; but in many ways it lacks the modernity and delicate craftsmanship to be found in his *Le Coq d'Or.*

The Story of "The Snow Maiden"

The plot is based on the Russian folk-tale of "The Snow Maiden." The action takes e in the mythical Russian province of Berendey.

Prologue. On the "Red Mountain." *Fairy Spring* sings of the seasons, the fields, the ls. A dance and song of *The Birds* prepare the entrance of *The Snow Maiden;* and the logue ends with an animated Carnival scene by a crowd of Berendeys on their way to forest.

Act I. In the village of Berendey. *Lell,* the handsome shepherd, sings his wonderful gs to *The Snow Maiden,* and *Misguir,* the merchant, forsakes his affianced *Koupara* in her or; but, as her name indicates, *The Snow Maiden* is made of ice, and her coldness and thy discourage their suits.

Act II. A hall in the *Tsar's* Palace. *Koupara* tells the *Tsar* of *Misguir's* unfaithfulness. er a royal procession the *Tsar* ascends the throne, commands that *Misguir* appear for gment, and banishes him from his realm.

Act III. The Sacred Forest. A fete of the Berendeys is on. The *Tsar* greets his people. he close of *Lell's* song the *Tsar* commands him to choose whatsoever maiden pleases him and shall be his. To the chagrin of *The Snow Maiden, Lell* passes her and selects *Koupara.* *guir* turns his affections to *The Snow Maiden* and pleads for her love but she frees herself escapes into the forest.

Act IV. The Valley of Yarilo. *The Snow Maiden* appeals to *Fairy Spring* to warm her ure. *Fairy Spring* calls on the flowers to lend their graces to *The Snow Maiden.* Her rt glows with tenderness and she finds herself awakening to love for the handsome *Mis-*. In an impassioned scene *Misguir* presses a kiss on her lips, at which *The Snow Maiden* ns to melt, and as her form disappears *Misguir* throws himself into the lake.

See for yourself—
how a beautiful skin
is developed and kept lovely

So that you can learn in a few minutes what years of scientific experience in the care of the skin has taught him, Mr. Ingram has devised the Dermascope. He believes you will join the millions who are now using Ingram's Milkweed Cream when you make the fascinating Dermascope test.

A few minutes with the Dermascope, following Mr. Ingram's instructions, will show you *how* and *why* Ingram's Milkweed Cream develops a healthy, beautiful skin—how it successfully wards off the signs of age which are creeping in, unnoticed, every day.

The One Cream Perfect for Every Use

Ingram's Milkweed Cream, used over thirty years, is a real beauty cream and the only one you need use to develop and keep a clear, soft, smooth skin. It is heavy enough to be a thorough cleanser and yet light enough in body to form a comfortable and effective protection and foundation for powder. But it has an exclusive feature—certain *remedial* properties that relieve redness, roughness, tan, freckles and slight imperfections. *No other cream is like it.* No matter whether you use it as a cleanser, a protection or a powder base—its nourishing and healing properties will bring fresh beauty and new life to your skin.

Buy a jar today and see the immediate improvement it brings. $1.00 and 50c jars at all drug and department stores—the dollar size contains three times the quantity.

In Canada: Windsor, Ontario Frederick F. Ingram Co. 243 Tenth Street, Detroit, Mich.
Established 1885

Ingram's Milkweed Cream

Ingram's American Blush Rouge

Applies so evenly and smoothly, its effect can only be a natural, healthy glow. It does not clog the pores and because its coloring matter cannot be absorbed it is recommended particularly for a delicate and sensitive skin. In thin metal vanity box with mirror and pad—50c. At your dealer's or by mail from us. Next time be careful to get ***Ingram's American Blush, the Delicate Rouge for the Delicate Skin.***

Send for this interesting test today

Mail coupon below with 15 cents for new Beauty Purse containing Ingram's Dermascope; a liberal sample of Ingram's Milkweed Cream; two filled purse puffs of Ingram's Face Powder and Rouge; instructions for using Dermascope, and valuable hints for the care of the skin.

The Organist's Etude

It is the Ambition of THE ETUDE to make this Organ Department "An Organist's Magazine Complete in Itself"

Edited by Well-Known Specialists

Some Practical Hints of Extemporizing at the Organ

By J. Cuthbert Hadden

I PROPOSE here but a few practical hints chiefly, of course, for the beginner and the inexpert. The beginner and the inexpert in extemporizing, that is, for no organist should think of extemporizing (in public, at any rate), who has not some technical ability, combined with theoretical knowledge.

As regards the former, it is obvious that unless the fingers (and feet) of the extemporizer can readily respond to his thoughts the result will be neither effective nor artistic. As regards theory, the player ought to be familiar with concords, discords, suspensions, sequences, cadences, pedalpoints, modulation, passing notes, development, imitation, elementary form, musical phrases and sections, and elaboration of themes. To this might be added a practical knowledge of fugal writing. It seems a formidable list of requirements, set out in this way; but no item is there that the good extemporizer can do without. As a matter of fact, these things are the stock of the trade of the extemporizer, and the beginner would be well advised to keep the list before him when he is improvising, and try to make use of as many of the items as possible. If, in addition to technical ability and theoretical knowledge, he possesses also inventive power and a retentive memory, there is no reason why he should not become a good extemporizer.

The Principle of Balance

The study must, however, be taken seriously in hand *as* a study; and the first thing to insist on is, that there must be regular form or design. The great underlying principle of music is the balancing of symmetrically-constructed phrases, contrasting with each other, yet in unity of thought. It has been said that the kernel of all form lies in the three chords, tonic, dominant, tonic, as typifying respectively rest, motion, rest. The ear having heard a phrase or section in the tonic, expects a contrast; that is, motion is desired to some related key, preferably the dominant. A second phrase or section is heard in that key, when the ear desires a return to the opening key and section.

Now, as regards form, it is always best for the extemporizer, whose powers have not become ripe, to use phrases of four or eight bars. The tyro should first try to extemporize a four-bar phrase, then an eight-bar phrase, always remembering what he has played. When this can be done, he has to extend his powers to the extemporizing of a second phrase suited to balance the first, but in a related key. A return to the first phrase, and a few bars added as a coda to intensify the feeling of the close, and the first germs of an extemporized voluntary have been obtained. Set it all before yourself thus when you sit down to practice:

(a) Four-bar phrase.
(b) Eight-bar phrase.
(c) Contrasting phrase.
(d) The whole twenty-four bars, with coda added.

When you find that you can do this well, without hesitation or stumbling, you may take it that you have laid your foundations as an improviser, and go on to more extended flights.

Unity of Rhythm

But how to do it well? There's the rub. It's not enough to get the musical form right. The melodic part ought to be fairly attractive, if not absolutely pleasing. Again, there ought to be some sort of unity in regard to the rhythm or time—form—even a commonplace phrase can often be flavored with a little originality by a judicious use of passing notes. Then there are the harmonies One sometimes listens to a poor improviser who confines himself practically to the familiar concords, reiterated in the most wearisome fashion. The true improviser must avoid all monotony of this kind. He must use discords as well as concords, aiming always at variety, freshness, and freedom. Even a formless improvisation may please the ear if there is a succession of interesting chords, but the strictest adherence to form will never make a succession of common chords interesting.

The advice of Sir John Goss to a young student of harmony was: "Write a thousand hymn tunes and then burn them." Goss' idea was that after such a preliminary the student might hope to write something worth keeping. The extemporizer would be none the worse, but all the better, for having written a thousand hymn tunes; but it would be much more practical service for him to take the melodies of a thousand hymn tunes and harmonize them at piano or organ. In this way he would learn how to *use* his chords, and it is that knowledge which is so necessary in extemporizing. There are plenty of organists who can *write* the harmonies for a figured bass, but not so many who can create these harmonies straight away at the keyboard. Yet this is an essential for the extemporizer.

Except for brief pieces (short preludes and the like), the organist should never attempt an improvisation without having previously settled on its plan, both as to the general scope of the movement and the tonalities to be used, with the degree of importance of each. In the actual working out, the plan may be varied to any extent but it must have been formed; and the player must always remember whence he came and whither he is going, leaving nothing to chance or the mechanical habit of the fingers. His imagination may lead him temporarily away from his prearranged design; but he should always get back to it again. Also he must never lose sight of his principal theme, or the secondary themes upon which the improvisation is built; drawing from fragments of them the developments of which they are capable; making these fragments the subjects of the principal episodes, or of new and unexpected *divertimenti*, and seeking constantly to create variety in unity.

For the final impression which a beautiful improvisation should leave upon the mind of the listener, is that of a work matured at length, strongly built, and written out at leisure. "Those persons," says a French musician, "who suppose that the improvisator abandons himself uncontrolled to the chances of inspiration, that he rushes headlong into the unknown, have the falsest notion of his art that it is possible to hold, and the most unworthy, also. The great improvisator is, on the contrary, the most sagacious, well-balanced, level-headed of musicians. These qualities are indispensable." Upon that keynote I conclude.—From *The Choir Leader*.

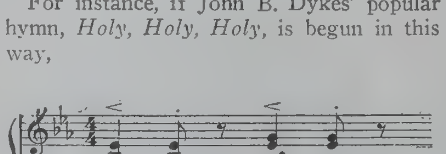
Hymn Playing

By Claude Timblin

MANY beginners in piano are called upon to make their first public appearance in Sunday School or Church, to play hymns. The fact that hymns are poorly played by a great many who are able to play more difficult music well would lead one to believe that a little more thought in playing of this kind would not be amiss.

If a player will take the trouble to read the stanzas of a great many of the well written hymns, he will gain a great insight into the musical intent. Hymns are rarely marked for phrasing and dynamics, but a little attention to the words and sentences of hymn will enable one to edit his own hymn. There is no better way in which phrasing can be explained to the second or third grader than by careful practice of hymns.

For instance, if John B. Dykes' popular hymn, *Holy, Holy, Holy*, is begun in this way,



a marked improvement will be noted. No one would think of playing a secular love song as they would a war song. Yet how often have you heard people play a sacred love song such as *Blest be the tie* with the same force and expression as *Onward, Christian Soldiers*, as though they were striking chords in a harmony class.

In many hymns a phrase is repeated two or three times. As written they may be played monotonously alike; but examine the words; perhaps then, one phrase will answer or reiterate the other. To play four verses of a hymn exactly alike is also apt to be tiresome. Sometimes the last verse is a climax as plainly as if it had *sfz* and *ff* marks all around it.

Hymns have changed as much in the last fifty years as has instrumental music. There is a vast difference between the modern evangelist hymn and the beautiful old tunes, found in the church hymnal of 25 or 30 years ago.

In conclusion, learn to color your hymns and make them more interesting. The singers will not always sing them as you play them; but they have to do with the words and are very apt to surprise you in pausing after a period or comma even if it does come in the middle of a measure. Music had its beginning in the church; and church music deserves the best a musician can give it.

How the Organist May Keep Out of a Rut

By E. H. Pierce

CONVERSING with one of the leading organists of New England—indisputably the best organist in his own city, he let fall the remark that he always made it a point to listen to his fellow-organists in neighboring churches as often as he could, and regretted that, owing to his own regular professional duties, opportunities to do so came so seldom.

"But what can you learn from them?" said I, "you are already way beyond their class."

With a twinkle in his eye, he replied, "I can always learn something. Perhaps, as often as anything, I learn what to *avoid*." This, by the way, was probably one secret of his excellence.

Saint-Saens once remarked that organists, as a class, were "too much in love with their own little habits and the calm of their existence." Without doubt he hit the nail on the head. They are not to blame for the fact that the nature of their employment automatically shuts them off from the opportunity for frequent hearing of other organists; but, realizing that condition, they should make constant effort to broaden their musical culture and keep out of a rut, even at the cost of some inconvenience. If they cannot be present at the church services at which other organists officiate, they can at least hear occasional organ recitals. If these are by some world-famous player, such as Dupré, Bonnet or Courboin, they will learn much; if they are by some obscure small-town organist, they will even then learn something, if only "what to avoid."

Nearly every organist uses orchestral transcriptions occasionally. I have nothing to say against the choice; but one should, where possible, hear the pieces played by some good orchestras, and note the tempos and manner of phrasing. This would put an end to some very absurd distortions and caricatures of masterpieces which are occasionally perpetrated at the keyboard.

Listen occasionally, too, to good opera companies, or even to musical comedies, and see if the wonderfully prompt "attack" and the general vitality of the performance does not put to shame your slouchy and dull renderings of anthems.

The particular type of music in vogue in one's own denomination or parish, is another source of danger, if not offset by a more general experience. For instance, in the Episcopal service, music by Anglican composers is largely used, which, while written in a correct and scholarly manner is often totally "wooden" and devoid of inspiration. Too exclusive devotion to this style is deadening to one's musicianship. On the other hand, in certain denominations I could name, they go to the other extreme and use much that is wishy washy and trivial, which is worse yet. Yet it is not necessary or advisable to seek to change the entire style of music which may be acceptable in any given place. By being on the look-out for what is really good, with patience to examine hundreds of compositions both old and new, one may select *the best in any given style*. For instance, the writer is no lover of what are commonly known as "Gospel hymns," yet he could name some half-dozen which he considers most excellent, and they are not necessarily those which approach the style of Dykes or Barnby. The word "good," except in a purely moral significance, is a meaningless word, unless one also answers the question "good for *what?*" The "best" anthem is the one which best fits the type of church service for which it is used, both in general style and in subject of the occasion. To find such anthems and to train the choir to their proper rendering, demands that the organist should be constantly on the alert. It will never do to relapse into a static condition.

Another thing in which the organist is prone to fall into a rut, is in the matter of registration. Even the smallest organs have unexpected and unexplored possibilities, if one searches for them. If your organ has set combinations, avoid making too much use of them—it is a lazy and deadening habit. Likewise, one should always be learning and using some new music for voluntaries and postludes, but should endeavor to use it at the most suitable occasion, not merely because a new piece is ready. Many times a new piece has been prepared for use as an opening voluntary, and its use deferred because it did not seem to fit in with the mood of the opening hymn. It will not go to waste, on that account; the time will surely come when it suits the occasion.

One of the most deadening habits for a choir is the use of anthem collections which are put out in periodical form by certain publishers. To be sure there is a slight economy in money, in buying them in this way, but they are mostly "punk;" and on the somewhat rare occasions when a really good anthem creeps in among them, the paper is too thin and cheap to stand repeated use. It may be laid down as a maxim that anything that is only worth singing *once* is not worth singing at all. A repertoire of twenty-five or thirty *really good* anthems will last a choir a year, without undue repetition. To make sure an anthem is not repeated *too* often, it is well to record each date of performance on the organist's copy. From time to time add new anthems, singly, and after most discriminating and careful search. This will avoid getting into a rut in this particular line.

Bach's Organ at Luneberg

Any organ ever used by the great Bach becomes of historic interest. And so the recent improvement of the instrument used during his incumbency at Luneberg has elicited the following very instructive article by Dr. G. Edward Stubbs, which we quote from the *New Music Review.*

"We read in a foreign contemporary that the organ upon which Johann Sebastian Bach played in Luneberg from 1700 to 1703 has been renovated and brought somewhat up to date. It is said that the pipes are nearly all in such perfect condition that they have been left as they were, with the exception of a thorough cleaning. The organ was built in the year 1537.

"We imagine that the veneration for the great master has had much to do with the preservation of this ancient instrument. In this country, where we now think nothing of 'scrapping' organs that were built only a few years ago, comparatively, this piece of news about the Luneberg antique ought to cause some astonishment.

"Some time ago a lengthy article appeared in one of the English journals on a 'pipe disease' that attacked old organ pipes, and destroyed the metal, or at least impaired it by some chemical action due to age. It would be of interest to know more about this Luneburg organ. If metal deteriorates in course of time, what about wood?

"In certain climates special care has to be taken in the selection of organ timber. In India, for instance, mahogany used to be considered indispensable. The writer once heard W. T. Best give a recital in London on a Hill instrument constructed largely of mahogany. It was bound somewhere for the far East, and it was said that climatic conditions required the use of that particular wood.

"However, in Luneburg there is perhaps no bacillus, or micro-organism, inimical to either pipe metal or wood.

"By the way, in these degenerate days, when walking is a lost art, and bicycles, trolleys and flivvers transport practically the entire population, it is well for us to remember that Bach thought nothing of walking from Luneburg to Hamburg to attend recitals at St. Catherine's Church, where Swelinck's celebrated pupil, Reinken, held forth.

"What a tribute to the Hollander! How many of us would shake in our shoes if we knew that hovering around our precincts was the great genius of Eisenach! From Luneburg to Hamburg must be a matter of something like twenty to thirty miles. Bach thought nothing of it—or if he did, his enthusiasm made him forget it.

"Although Reinken's compositions are now unknown, one of them provided Bach with themes used by him in a famous extempore performance at Hamburg in 1722, on which occasion Reinken is said to have remarked: 'I thought that this art was dead, but I see that it still lives in you.'"

Relation of Organ Touch to That of the Piano

By Dr. S. N. Penfield

Does the one injure the other? Surely they are entirely different. We have all heard good pianists spoil a hymn tune or an organ solo, and on the other hand have also heard a good organist murder a piano solo. Is success, then, on the two instruments incompatible? Read history with care, and especially the lives of Bach, Mendelssohn and Saint-Saëns, and learn there is no such incompatibility. They and many others were renowned pianists and famous organists. They had mastered the peculiarities of both instruments and kept the ouch of the two separate and distinct.

To be sure Bach's instrument was the clavichord, but its touch was extremely delicate and sensitive, while that of the seventeenth century organ was stiff and clumsy compared with ours of to-day. This of course shows that one *can* excel on both instruments, but not necessarily that it is advisable to try to do so.

Is it, or is it not thus advisable? Here are some pointers that have a bearing on the case. The ordinary piano touch requires a very loose wrist and a free lifting of the fingers, but not very high. Rapid and leggiero passages demand a freer lifting of the fingers. Legato playing on the piano is of two grades. For the ordinary legato the rule is to leave the old note simultaneously with striking the new note. This corresponds to the old-fashioned well curb where two buckets are fastened, one to each end of a chain, so that one is falling while the other is rising. They of course pass each other at the half-way point of the well. As a consequence one has left the water before the other reaches it. A similar thing happens with the fingers. The old key is left just before the new one is touched. Still for ordinary running passages this gives a practical legato, and very many pianists never acquire a better one.

The perfect legato consists in making the two notes to apparently overlap each other by the least trifle, so that the departing tone will seem to the ear to absolutely join the coming tone. This is essential for the so-called "singing" touch. But the common failing of piano students and

KIMBALL

"The Instrument of Yesterday, Today and Tomorrow"

Joseph Schwarz, eminent baritone of the Chicago Civic Opera Co., whose "glorious voice" and power of interpretation have made him one of the most interesting figures before the artistic world today, enthusiastically endorses the Kimball Piano. He says: "The Kimball entirelv meets my requirements."

Edouard de Reszke, one of the greatest dramatic baritones of years past, expressed highest appreciation of the Kimball in saying: "I am absolutely satisfied in every respect."

Both artists of international renown unite the preference of past and present in their admiration of the Kimball.

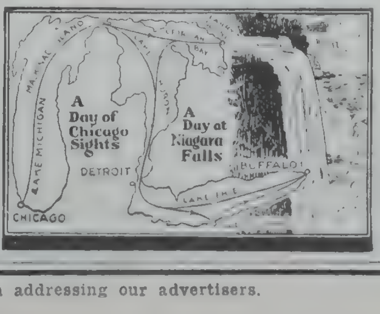
Social hostess will get you acquainted. Screened-in playground for children.



A danger signal — tender and bleeding gums

HEALTHY teeth cannot live in diseased tissue. Gums tainted with Pyorrhea are dangerously diseased. For not only are the teeth affected, but Pyorrhea germs seep into the body, lower its vitality and cause many ills.

Pyorrhea begins with tender and bleeding gums. Then the gums recede, the teeth decay, loosen and fall out, or must be extracted to rid the system of the poisonous germs that breed in pockets about them.

Four out of five people over forty have this disease. But *you* need not have it. Visit your dentist often for teeth and gum inspection. And keep Pyorrhea away by using Forhan's For the Gums.

Forhan's For the Gums will prevent Pyorrhea—or check its progress—if used in time and used consistently. Ordinary dentifrices cannot do this. Forhan's keeps the gums hard and healthy, the teeth white and clean. If you have tender or bleeding gums, start using it today. If gum-shrinkage has already set in, use Forhan's according to directions, and consult a dentist immediately for special treatment.

FRECKLES

Don't Hide Them With a Veil; Remove Them With Othine—Double Strength

This preparation for the treatment of freckles is so successful in removing freckles and giving a clear, beautiful complexion that it is sold under guarantee to refund the money if it fails.

Don't hide your freckles under a veil; get an ounce of Othine and remove them. Even the first few applications should show a wonderful improvement, some of the lighter freckles vanishing entirely.

Be sure to ask the druggist for the double-strength Othine; it is this that is sold on the money-back guarantee.

amateur players is that they quite forget to take up their fingers at all, especially in the left hand. This sounds slovenly, but shows even more on the organ, where the effect is really hideous, and for once the organ gets its revenge.

Organ playing requires an invariably firm, quick pressure on the keys, and this in all movements—slow or fast, loud or soft. This is especially important with the old tracker action, so that the valves will instantly open. The staccato of the piano does not exist for the organ. The organ staccato is made by the firm pressure above mentioned, followed instantly by the lifting of the fingers. It practically corresponds to the so-called slurred staccato of the piano.

Organists get their preliminary studies on the piano or the cabinet organ. From the former they come to the organ with a firm, decided touch; from the latter, with a weak nerveless touch. In this the piano has the advantage. A perfect organ legato is an essential, but the ordinary piano legato is not a legato on the organ—certainly not with the big pedal pipes. All organ pipes speak a trifle sluggishly, so that with many combinations there is a perceptible interval between the instant of the attack of fingers or feet upon the keys and of the tone reaching the ear. The experienced organist discounts this and secures a perfect legato effect.

Thus we find, first, that while the touches of the piano and organ are and must be kept distinct, the piano student brings to the organ the sharp touch which is requisite, and second, that the organist brings to do the preliminary preparation of mangato which is essential in all "singing" passages; and we see that the study of each instrument helps the other if the player but uses his ears and his wits. Many concert organists really find it highly advantageous to do the preliminary preparation of manual parts at the piano; and, if they have a pedal attachment, of the pedal part as well—and yet run no risk of injury to their organ touch.—From *The Musical World.*

Facts on Familiar Hymns

(From "Studies of Familiar Hymns," by Louis F. Benson)

OUR most-sung hymn tune, "Old Hundred," was written by Louis Bourgeois, to a metrical version of the One Hundred and Thirty-fourth Psalm, published in the Genevan Psalm Book in 1551. When the English Psalm Book was published in 1561, William Lethe translated the Hundreth Psalm in a meter to fit Bourgeois' tune to which its union has become so close that it is hard to say which is "The Old Hundredth."

Whether "Jesus, Lover of My Soul" is the product of Charles or of John Wesley has not been definitely determined.

"Guide me, O Thou Great Jehovah" was written by William Williams, "The Poet of the Welsh Revival," early in the eighteenth century. Later it was translated into English, partly by the Rev. Peter Williams and partly by the author.

"Lord, I am Thine, Entirely Thine" is by Samuel Davies, the earliest Presbyterian hymn writer in the colonies, and the earliest American hymn writer of any denomination whose hymns are retained in our hymn books and used by our congregations.

Charles Wesley was born in the same year (1707) in which Watts printed "There is a Land of Pure Delight;" while Toplady, author of "Rock of Ages," was born in the year (1740) in which the Wesleys printed "Jesus, Lover of My Soul."

"All Hail The Power of Jesus' Name" was first published in 1779 with no mention of the author. Not until sixty years later was it discovered that the hymn was the product of the Rev. Edward Perronet.

"The Church's One Foundation," written by a pronounced High Churchman, has become the "marching song" of almost all communions, denominations and sects. An English archbishop has said that wherever called upon to dedicate a church he could always count upon two things—cold chicken and "The Church's One Foundation."

"O Love That Wilt Not Let Me Go," according to Rev. George Matheson, the author, was when "Something had happened to me, which was known only to myself, and which caused me the most severe suffering. It was the quickest bit of work I ever did. I am quite sure that the whole work was completed in five minutes, and equally sure that it never received at my hands any retouching or correction." The statement that this suffering was the result of a woman's refusal "to go through life with a blind man," may be ignored, as he had been "a blind man" for twenty years.

Attack and Abandon of Hymn Phrases

By E. F. Marks

THE church organist, who in addition to his manifold duties as accompanist and soloist, must perform the work of director of the choir as well, should pay attention to the attack of the first note of the verse or phrase of a hymn by his choir, and should have the congregation to observe this surety of commencement. We realize how disagreeable it is have one voice beginning a phrase directly on time with the first note of a phrase, and others entering one or two notes later. It certainly gives a ragged edge to the attack. Imagine the undesirable effect produced by the different members of an entire congregation performing the commencement of each verse or phrase in this manner. At times some voices will delay entrance as far as the fourth word of a line. Such dalliance by a congregation with the beginning of verses or phrases is entirely unnecessary; and if singers would enter more heartily into the sipirit of singing and give more attention to this detail many hymns would be enhanced in value and interest.

However, if the choir, which is the leader of the congregation in song, will give the attack to the first word of each phrase of the hymn with precision and directness, the congregation will observe such accuracy and finally overcome its diffidence in regard to this delinquency.

The relinquishing of a phrase or sentence simultaneously by members of a congregation is perhaps more difficult of attainment than that of the attack to the beginning. Nevertheless, again it falls to the duty of the choir to set the example for imitation by the assembly, by adhering closely to the time value of each note ending a phrase and ceasing immediately upon the expiration of this value. In using such accurate cessation of sound, singers no doubt will notice how easy the attack of the next phrase becomes. Through close observation of the attack and abandon of the different phrases of a hymn, by keeping accurate value of the pulsations of the tempo, an organist will ultimately secure perfect and beautiful renditions of hymns, not only by the choir itself, but also by the congregation as well.

AUSTIN ORGANS

NEW YORK, Philadelphia, San Francisco, Chicago, Detroit, Los Angeles, Richmond, Atlanta, Charleston, Minneapolis, Cincinnati, Seattle, Troy, Worcester, Baltimore, and many other large centers are possessors of notable Austin organs.

Over twelve hundred are now in use, representing an average output, since active operations a quarter-century ago, of about one organ a week.

The list of Austin owned patents runs into scores.

Evangelistic Piano Playing

By GEORGE S. SCHULER
PRICE, $1.00

Every Pianist Will Find This an Extremely Helpful Work—Full of Interesting, Practical Hints on Effective Hymn Playing

Very often the playing of hymns as they are written is not easy nor effective upon the piano. The effect of the singing of the four parts is usually the main thought in the mind of the composer, not the question of how many notes the right and left hand shall play, or whether the performance is, or is not, physically easy.

This book gives numerous illustrations showing how to adapt real piano accompaniments to hymn-tunes. This is an interesting subject to all pianists and this book will help those who should become more proficient in playing religious songs in which the piano accompaniment is lacking.

Question and Answer Department

Conducted by ARTHUR DE GUICHARD

Always send your full name and address. No questions will be answered when this has been neglected.

Only your initials or a chosen nom de plume will be printed.

Make your questions short and to the point.

Questions regarding particular pieces, metronomic markings, etc., not likely to be of interest to the greater number of ETUDE readers will not be considered.

A Long-Distance Question.

Q. *I am very fond of music, but unable to pay a teacher, so I study by myself. In order to become proficient in singing music at sight I use Root's "Methodical Sight Singing" (Theo. Presser Co.). Is this a good book for that purpose? Will you kindly suggest any good books that will help me?*—Christ Church, Barbados, B. W. I.

A. The book you name is an excellent one for acquiring the art of Singing at Sight, by means of the movable Do. When thoroughly mastered, study "Melodia," by Samuel Cole. This is not a method of sight-singing, but an admirable and complete collection of exercises in reading music at sight, to which you may apply all you have learned from Root's "Methodical Sight Singing."

Cavatina, Air, Aria.

Q. *Is there any difference in the meanings of these terms, or may they be used indifferently?*—Teacher, Louisville, Ky.

A. The term "air," as popularly employed, means "tune" and designates the top-line in part singing, or the melody of a song or instrumental solo. By "aria" a more pretentious form of melody and composition is intended. The term aria is applied to the most important vocal solos in the oratorios and operas of the great masters. A "cavatina" (the diminutive of *cavata*, Italian for the action of sounding a tone) of smaller dimensions than an aria is a simple melody, much resembling a *lied*. It has only one movement, avoids repetitions, and was used formerly as the lyric ending of a recitative.

The Diminished Seventh and the Dominant Thirteenth.

Q. *Are these chords very much used in composition, and which is the more useful of the two?*—C. C., New Bedford, Mass.

A. Yes; they are not only very much used but very much abused, even to satiety. The diminished seventh is the more useful, because it is a great aid to modulation to extraneous keys. The great operatic composer, Verdi, advised students of composition to "listen to opera without being dazzled by rich harmonies or orchestral effect, or by the chord of the *diminished seventh*, the rock and refuge of those who cannot write four measures without it."

Plain Chant, Plain Song: Gregorian Music.

Q. *What is "Plain Chant" and why is it so called?*—Bertha, Potsdam, N. Y.

A. Plain Chant (from the Latin, *cantus planus*, having no definite time values as distinguished from *musica mensurabilis*, having definite time values), better known to us as Plain Song, is the name given to the earliest music of the Catholic Church. It dates back to the first century of our era and is also known to us as Gregorian Music, from the fact that Pope Gregory the Great, about the year 600 A. D., is credited with the ill-founded renown of having introduced this music into the liturgy of the church; whereas it is an undoubted fact that other popes, long before him (as far back as Pope Damase I, 366-384) had organized and introduced Plain Song into the liturgy. This is the music which is to-day in universal use in the Catholic Church. Much of it bears a strong relationship to the oldest chants of the Hebrew Synagogue.

In Alt—In Altissimo . . . "La Bastardella."

Q. *What is understood by "C in alt?" Has anyone ever sung the C in altissimo?*—Soprano, Minneapolis, Minn.

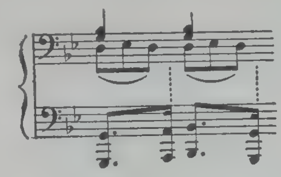
A. The notes in the G clef (commonly called the treble stave) of the octave above this stave, beginning with the G immediately above the top line, are said to be "in alt." Yes; Lucrezia Agujari, known as "La Bastardella" (1743-1783) astounded Mozart by singing up to C in altissimo (the octave which begins at the G above the soprano high C) and by trilling on the F above high C.

Ans.—As a rule, sonatas do not have any "names" but are compositions written in "sonata form." Do you know what this means? If not, look it up or ask your teacher. Some of the best-known simple sonatas for you to play are by Beethoven, Haydn, Mozart and Clementi.

Dotted Eighth-Notes with Sixteenth Complements Against Triplets.

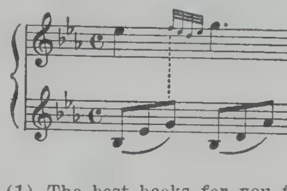
Q. *How is the following to be played? Is the last note of the triplet in the right hand played at the same time—struck at the same time—with the sixteenth-note in the left hand. When this is played after, it sounds "jerky" to me!*—P. L., Oklahoma City, Okla.

A. Yet this is how it should be played. Practice and the avoiding of giving any accent whatever to these notes, whether sixteenth or triplet, will do away with any sound of jerkiness.



Grace-Notes.

Q. *(1) Can you recommend some book on Grace-notes, turns, and so forth, as there seems such a diversity of opinion on their correct rendering? (2) In the following, would you have the turn played with the G in the left hand, or starting on the second beat with B in the left hand?*—J. J., Oxford, Ohio.

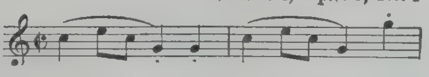


A. (1) The best books for you to consult about grace-notes, turns, trills and other ornaments are first-class dictionaries of music. Also, there are a few excellent "Pianoforte Schools" wherein every musical ornament is written fully, showing how each is to be played with its bass. The "Charles Hallé Pianoforte School" adequately solves the grace-note problems. It should be stated that the rendition of the various signs for grace-notes is somewhat available, depending largely upon the individual taste and musical understanding of the performer; that is the reason why Bach, in his later compositions, wrote out fully just what he wanted for ornaments. Modern composers write the exact notes they wish played. (2) Play the turn with the G of the bass.

Staccato and Staccato-touch.

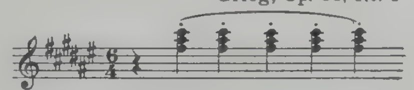
Q. *Should the slurred dotted-note, in this sonatina (a) be played with a finger staccato and the next one with a wrist staccato? Please state how to play chords that are staccato and, also, how to play slurred dotted chords, as at (b). What is the grade of the Clementi Sonatina?*

Clementi, Op. 36, No. 1

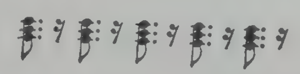


A. Play each of these with a light wrist staccato. Staccato chords are played by wrist or arm staccato, according to weight (power) and pace required. Slurred dotted chords similar to the Grieg example may be played by finger staccato, because the staccato indicated is not so much a staccato as a slight detaching of the chords from each other, the exact time values being:

Grieg, Op. 63, No. 6



played:



The technical execution of Clementi, Op. 36, No. 1, belongs to grade 2, but its touch, phrasing and interpretation place it in grade 3 or 4.

Etudes Preparatory to Chopin's Etudes.

Q. *What Etudes would you recommend to precede those by Chopin? I can play Cramer, Moscheles and Haberbier, but find Chopin rather too difficult.*—R. B. A., Danielson, Conn.

A. The Etudes by Baermann and by Kessler, in that order.

How to keep your hands dry when you play

Send for generous sample of Odorono—the sure, safe perspiration corrective

A noted concert pianist says the greatest annoyance he has to meet is—*wet, clammy hands!* Many a brilliant performance has almost met disaster because the player's hands were wet and sticky and so, uncertain of movement.

This condition is largely due to nervousness. Excitement of any kind, as well as heat, stimulates the perspiration glands to unusual action.

But fortunately it is a condition very easy to correct! For one application of Odorono to the palms will keep them dry and comfortable for several days. And you need not worry, for physicians say it is absolutely harmless to control perspiration in such a limited area.

Odorono, you know, is the *original* perspiration corrective—formulated by a physician for both the moisture and odor of perspiration under the arms or for excessive perspiration on any small surface of the body. It is a clear, clean antiseptic liquid now widely used in hospitals by physicians and nurses.

The perfect underarm toilette

Men and women everywhere now depend upon Odorono for complete protection against underarm odor—a danger to which everyone is subject, in spite of scrupulous soap-and-water cleanliness.

Twice a week is all you need to use it! One application will safeguard you for three days, from that distressing moisture which ruins clothing, and that repellent odor which destroys your daintiness. Just a short, simple little part of the toilette—yet how much it saves; how much it gives in comfort and attractiveness! *And when you play, enjoy dry, comfortable hands and underarms!* 35c, 60c, and $1 at any toilet counter; or sent by mail postpaid.

Send for these three generous samples

RUTH MILLER
426 Blair Avenue, Cincinnati, Ohio
I enclose 10c for which please send me samples of Odorono, Creme Odorono (for odor only) and Odorono Depilatory, with booklet.

(Note: Sample of any one, 5c. Cross out ones not wanted.)

The Violinist's Etude

Edited by ROBERT BRAINE

It is the Ambition of THE ETUDE to make this Department "A Violinist's Magazine Complete in Itself"

Self Instruction in Violin Playing

THE doctors have a saying that "He who doctors himself has a fool for a patient." Lawyers say that "He who is his own lawyer has a fool for his client." Naturally the violin teacher says, "He who tries to teach himself violin playing has a fool for a pupil." Be that as it may, there are millions of people who doctor themselves, other millions who try to do a great part of their legal business without consulting a lawyer, and a great many people who try to learn to play the violin without a teacher.

So many people write to the ETUDE seeking to find the value, if any, of self-tuition, that a frank discussion of the subject will no doubt interest many. Here is a typical letter of the many we receive. A young piano teacher from Texas writes: "Will you kindly advise me if it is possible for anyone who is pretty well advanced in piano to take up the study of the violin alone (there is no violin teacher in this place) so that in time she would be able to play such simple melodies as folk songs and hymns intelligently.

"Please be frank (as I do not care to waste time) in advising me and suggesting instruction books."

Years Absolutely Necessary

At the outset of the discussion it should be frankly stated that it is quite impossible for anyone, no matter how talented, to build up a big technic and become a really artistic violinist, competent to cope with difficult compositions for the violin, without several years of instruction under a really good teacher. Some of the world's brightest musical minds have been engaged for the last two hundred years in developing and building up the art of violin playing to its present perfection. How then can anyone hope to discover for himself all that these patient workers have done. He would have to be a hundred geniuses rolled in one—a super-genius.

In the early days of violin playing the art was in an absurdly crude state. The difficulties which any good solo violinist makes light of to-day would have seemed utterly impossible to violinists in those early days. When the art was beginning, violin players used to call out, "Look out for the C," when the first C above the staff appeared in the music. They thought it quite a feat to play that C, in good tune. Now every good violinist plays all over the fingerboard, from the bottom to the extreme top and thinks nothing of it.

The great technical feats as we know them to-day were thought to be almost supernatural as late as the days of Paganini. A man who attended one of Paganini's concerts said that he, himself, had actually seen the devil standing at Paganini's elbow, helping him to play.

The first-class violin teacher of to-day is the heir to the knowledge built up in two hundred years by thousands of violin players all over the world. This knowledge has been passed by personal contact from one to another, as one would light a torch from that of another. Such knowledge can be imparted by books to only a slight degree.

A Teacher Necessary

All violin authorities unite in the opinion that complete mastery of the violin in its highest degree, without a teacher, is an utter impossibility. Spohr, one of the greatest of all violinists and teachers, says in his *Violin School,* that the pupil should have a lesson from a good teacher every day, at first at least. The writers of standard studies for the violin such as Kayser, Mazas, Kreutzer, Fiorillo, Rode, Paganini, Sevcik, and many others, all evidently assumed that these studies were to be studied with a teacher, for they failed to write any explanations or instructions to accompany the exercises, as to how the studies were to be played. All this was left to the teacher.

But to return to self-tuition. Let us see how much can be done without a teacher. At the outset it might be remarked that there is really no such thing as an absolutely self-taught violinist. If a human being had been raised on a desert island and had never seen or heard a violin, and when old enough to handle one should be handed a violin, a bow, and an instruction book, we should hardly expect him to accomplish much.

All these "self-taught" violinists of whom we hear so much, have seen and heard much violin playing, yes, and have asked questions of other violinists. "Show me this, and that," they have asked when associating with other violinists. They may not have had lessons in the sense of going to a teacher at a certain hour once or twice a week, but they have watched and listened to other violin players and have asked many questions. Instruction is instruction, whether it is obtained directly from a teacher at certain periodical lesson hours, or from keeping eyes and ears open when other violinists are around.

We often hear country fiddlers boast that they "never had a lesson in their life;" but they have listened to each other play by the hour, and have thus picked up many of the tricks of the trade by listening and watching each other.

People who try to learn the violin without paying for the instruction of a professional violin teacher are divided into three classes: First, those who live where there is no teacher to be found; second, those who cannot afford to pay for instruction; third, those who try to learn without a teacher from the sheer love of surmounting difficulties unaided, without "being shown;" just as many people delight in solving riddles and rebuses.

Take Three Lessons a Week if Possible

Any one who wishes to learn to play the violin in an artistic manner, and can afford it, should take two or three lessons a week from the best teacher obtainable. Trying to do without a teacher is a shocking waste of time, and one gets nowhere. It is like crossing the continent in an ox-cart instead of taking the limited express or an aëroplane.

But some cannot afford or secure a teacher. They yet have a passionate desire to learn the violin, and take much pleasure in trying to work out the problem unaided. To such, if they are talented and ingenious, I will say that a certain limited amount of violin playing can be learned from books, articles, listening to and watching others. Such a student cannot expect much in the way of artistic violin playing; but if he limits his ambition to simple melodies and easy pieces such as folk songs, hymns and little dance pieces, as is the case with our correspondent, he will likely meet with more success.

Much depends on talent. Some are so lacking in musical talent and natural aptitude for violin playing that they cannot learn the violin even passably well under instruction of the best teachers; while others take to it as naturally as a duck to the water.

The first problem for the self-learner will be tuning the violin. At first he can tune to the G-D-A-E of a piano, organ, or any instrument of fixed pitch. If these instruments are not available, a tuning pipe sounding the notes G-D-A-E can be obtained at any music store for a half dollar and the strings can be tuned to these. In a short time, if the student has a good ear, he can tune more accurately by the ear alone, by sounding the strings of the violin in chords after having tuned the A of the violin to the piano, tuning fork or pitch pipe. The chord A-E should be first sounded in tuning, then D-A, then G-D.

Student Helpers

There are two great sources of help to the violin student going alone: books about violin playing, and watching and listening to other violin players. Everyone has opportunities of hearing violin playing at concerts, at the theatre, at dances, often at the movies, and at all sorts of entertainments. On such occasions the student who is trying to learn by himself should watch the violinist carefully, noting his bowing, the position of arms and fingers, and the various movements employed in playing. Many ideas can be picked up in that way. Also such a student should not hesitate to ask questions of other students and violinists. Such questions will usually be answered with pleasure, for any violinist worthy of the name is only too glad to assist a brother student who cannot afford the necessary instruction.

In small country towns or in the country, there is frequently very little violin playing to be heard; but even under such circumstances the learner frequently has an opportunity to hear traveling violinists or to visit the nearest town where violin playing can be heard at various entertainments.

When listening to a symphony orchestra the student should sit at the left (facing the stage) as the first violinists sit at this side, and bow outward toward the audience, giving the part of the audience on the left a good chance to watch their motions. The student should sit well down toward the front to get a good view of the bowing.

Attend Rehearsals

The self-learner should lose no opportunity to attend any rehearsals where there is violin playing, as on such occasions he would have a chance of watching and hearing the violinists at close range, and there would be frequent opportunities of asking questions on matters which puzzle him.

In addition to instruction books, which usually contain only a limited amount of actual explanation and are usually written with the view of their use when studying under a teacher, the student should get one or more of the many excellent works which are available, which contain mostly explanation of the art of violin playing and very little music. Among such works might be mentioned "The Violin and How to Master It;" "Violin Teaching and Violin Study," by Eugene Gruenberg; "Technics of Violin Playing," by Courvoisier; "Modern Violin Technic," by Frank Thistleton; "The Violinist's Lexicon," by George Lehmann, and a number of others. Most of these works can be bought for the price of a single lesson from a good teacher; and yet it would take a teacher $500 worth of time to teach the pupil what is contained in any one of these works. I would advise the student trying to learn with or without a teacher, to buy all these books and to make a constant study of them. Some of these works have illustrations showing how to hold the violin, position of arms, fingers and so forth, and minute directions about the various bowings and about every department of violin playing.

Books That Help

Most regular instruction books are designed to be used under instruction, and the self-learner cannot make much out of them. He should choose one or more which have the most explanation accompanying the music. Dancla's "Conservatory Method" contains a good deal to help the self-learner, and some of the modern works written to help pupils in public school violin work would prove of assistance. A work of this kind is the "Class Method for the Violin," by Albert G. Mitchell, Mus. Doc.; "The Easiest Elementary Studies for the Violin, Op. 38," by Wohlfahrt, has not much accompanying explanation to the exercises, but is very good for the beginner. The Hermann "Violin School, Vol. 1," is also an excellent work, and while there is little explanation, the various problems connected with violin playing are presented in a very clear manner. It is a good idea for the student without a teacher to get several instruction books, since what is not clear to him in one, may be more easily comprehended from the study of another.

For pieces, he should take little melodies with which he is familiar, such as patriotic airs, hymns and familiar songs. The scales, also, should be a constant study.

Even although he cannot afford *regular* instruction, the pupil trying to learn without a teacher would find it an immense advantage to take one or two lessons occasionally. In preparation for these lessons he should keep a note-book, and when anything puzzles him he should jot it down, so as to ask the teacher about it when he takes his lesson. This is an excellent idea, tlso, for the violin student who is under regular instruction.

Violin or Fiddle?

MANY violin students seem inclined to look down upon the term "fiddle" and prefer the more euphonious title "violin." As a matter of antiquity, the name fiddle is doubtless very much older than that of violin. Indeed a lute-shaped instrument called the *fidicula* was known even before the Christian era.

The violin really finds its great-granddaddy in the *monochord.* Take an oblong box, put a peg in one end, attach a wire to the peg, let the wire pass around two triangular nuts in the top of the box, and attach the other end to a screw, or (as in earlier examples) attach the wire to weights so that the tension may be increased as desired. Under the wire mark the necessary divisions of the parts of the string required to make a scale. This very primitive instrument played with a bow served for centuries for the training of the voice and the tuning of the organ. Its gradual development through various forms led to the violin, and later to the pianoforte. The modern violin, however, is only about three centuries old.

"Considered musically, the ideal orchestra is one which will contain a quartet of every kind of legitimate orchestral instrument; this will permit a four part harmony in every quality of musical tone."—Paul Whiteman.

Violins, Violinists and Violin Tone

By Robert Alton

THE vexed question of tone value, constantly under discussion in violin circles and scarcely ever satisfactorily settled, is one which admits of variously correct solutions, solutions which are, in fact, often either altogether erroneous, or only partial answers to the problem. The violinist has his own opinion, the maker frequently quite another, whilst the violin itself often settles the matter in no uncertain manner. To try to reconcile these three points of view is the object of the present article.

Volume and Good Tone Different

Good tone does not by any means include loudness or volume. In fact, it is a very rare occurrence to meet with the fiddle which is both sweet and powerful. "Carrying power"—two words which have been grossly abused—does not mean loudness, either. A fiddle which is "noisy" under the ear will often fail to be heard at all in a large concert room, whilst the "singing" fiddle will swell and travel, and fill the whole place with musical sounds. But there is more in the question than this. The fiddle will not "play well" at all unless it is in thorough order and correctly adjusted, and this matter of adjustment is one of the rocks upon which the violinist is frequently wrecked. Violins are frequently in the market through no fault of their own, but simply because the adjustment is faulty and the owners do not know it. This is undoubtedly a fact, and many violins have passed through the writer's hands, given up in despair by their owners, who were often astonished at the improvement in tone effected by reasonable and sensible adjustment. Now, no violinist can obtain maximum of quality from the minimum of adjustment. Provided he be sufficiently clever he will make a mediocre violin to sound well, but that is a different thing altogether from obtaining fine tone from a finely adjusted fiddle.

Employ a Reliable Craftsman

First of all, then, we must have a satisfactory instrument, one which is adjusted to its maximum of tone quality. This is a matter for the skilled maker, and there are few violinists who are fitted, either by training or inclination, to undertake the tedious and exacting work of adjusting a delicate and sensitive instrument. Take the fiddle to a reliable craftsman and leave it to him. One word is necessary here. Don't trust a valuable violin to a tinker in musical instruments. The cost of skilled workmanship may be excessive when viewed in comparison with the charge of the unskilled or semi-skilled individual, but it will be found (generally at some expense and annoyance) that the skilled work is the cheapest in the end, and after all, the "laborer is worthy of his hire."

But, when it is satisfactorily established to the owner that his fiddle is as perfect as possible, it must not be supposed that the matter ends here. In fact, it is only just beginning. The fiddle, no matter how good, will not play itself, and good *tone* may not be produced from any fiddle without the aid of the player. And this brings us to a vexed question indeed. What is good tone? Orchestral violinists (some of them) give one the impression that good tone is power and plenty of it. And they demand heavy bows, with plenty of wood in them, and these bows are often enough used like weavers' beams. Yet Francis Tourte built light bows—the last word in grace and elegance—and these bows were, and are, good enough and heavy enough for the finest violin *virtuosi* in the world. So we cannot sit down and say power is good tone. It is no more good tone than a loud fiddle is a good fiddle. There is something more to be said about the matter than this. Our greatest violinists do not produce fine tone by "laying on" until the stick is playing the fiddle and not the hair. Modulation and tone color are obtained by very different means from that.

It is not to be supposed that fine technique is necessarily fine violin playing. Technique is one thing, tone value is quite another. We have numerous examples of technique on the music-hall platforms today, but the producer of fine tone who is also the possessor of fine technique is seldom found there. At least in this latter case, the management who engage him know the difference between his art and the art (if it may be so dignified) of the trickster, and usually increase the price of admission. He is really used as an advertisement. For the way to fine violin playing is a straight and narrow one, and long withal.

Outlook On Life

Aspiration and outlook on life generally play an important part in the production of good tone. In fact, does not aspiration and outlook generally mould character? How is the would-be executant of the classical masters to reproduce or render their works correctly unless he is of the calibre of understanding by which these masters produced their works? Understanding and sympathy, gained by long continued striving and much deep thought, are as necessary for the production of fine violin playing as it was necessary for the work of fine painting, fine sculpture, and fine art generally. It must be in the artist before it is in his work. We often hear the remark passed: "He is a fine player; he practices eight hours a day." This is arrant nonsense. A man might practice twelve hours a day for years and be nothing more but a trickster at the end. Practice will not carry him very far; sympathy, understanding, and a love of the right and detestation of the wrong, plus practice, will carry him almost all the way. And that is all he may hope for in this world of limitations. John Ruskin pointed this out in no uncertain fashion in regard to the art of painting, and his remarks apply with equal force to the violin and to violin playing. And it is to be noted in this connection that when the violinist has traveled on this road for a time, it will be a difficult matter indeed to deceive him with a labelled fiddle, no matter *whose* name is on the label; for he has created for himself a standard of tone, faulty it may be, but immeasurably superior to the ordinary standard of criticism, and this standard of tone is a sure protection for him against inferior fiddles. He is not to be hypnotized by any name, nor yet by build, model, outline, age, or any other shibboleth—he *knows* good tone and recognizes it immediately, and is not thrown off the track by paper labels. Unfortunately, at our present stage of progress, there are so few of his kind.

The Work

The work of the virtuoso is controlled and modelled by observation, experience, some suffering and much hard work. The way is hard, but the result is worth the struggle. He at least has the satisfaction, at the end, of knowing that, if he has not scaled the walls, he has at least succeeded in rearing the storming ladders, which, mayhap, may somewhere and at some time enable him to see the prospect on the other side.—From the *Musical News and Herald* (London).

TWENTY-FIVE MELODIES FOR EYE, EAR AND HAND TRAINING. By Mathilde Bilbro. Price, 75 cents

These little pieces may be regarded as second grade studies. They are intended to aid in establishing the position of the hand upon the keyboard, attaining freedom, training the eye, especially in leger lines, in staff positions and cultivating a musical ear. These studies are all tuneful and interesting to practice. Altogether this set of study pieces promises to become popular with teachers as well as students well in the second grade.

THEODORE PRESSER CO. PHILADELPHIA, PA.

SUMMY'S CORNER

In interviewing a number of leading authorities on methods of teaching beginnings, *all* agreed that modern material for beginners on the piano should include the following points:—

1.—Music that introduces at once the Big Clef (Treble and Bass) with middle C as the pivotal point.
2.—Music with words which provide the basis for phrasing and rhythm.
3.—Music that follows natural diatonic and harmonic outlines.
4.—Music that lies well under the hand and is a basis for technical development.

The following books provide material that meets the above requirements:—

THE CHILD AT THE PIANO, *by Meda Z. Steele*............Pr. 75 cts.
FROM THE VERY BEGINNING, *by Phyllis L. Keyes*........Pr. 60 cts.
FIRST MELODIES FOR THE PIANO, *by Sara Jackson*.......Pr. 75 cts.
ON THE ROAD TO TONELAND, *by Bessie W. Sherman*......Pr. 75 cts.
THE VERY FIRST LESSONS AT THE PIANO, *by Mrs. Crosby Adams*.... 90 cts.

To *precede* the above material USE
HOW TO TEACH PIANO TO THE CHILD BEGINNER, *by Louise Robyn*..... $1.50
An outline for Teacher and Mother, consisting of 36 chain lessons, providing all the *essentials* that must be taught to every beginner.

To *follow* the above material USE
THE GRADED STUDIES, *compiled by Mrs. Crosby Adams*
Published in seven books, Grades 1-5, Each vol................ $1.00

IT'S REALLY SURPRISING HOW

Stuber's "Instrumental Music Course" has met with the warm approval of supervisors and teachers.

The coming school year will find this course forming the backbone of public school instrumental music in many of the more advanced cities. Its practicability has been proven by four years' use in public schools. Constant revision keeps it up to date in every particular.

We would appreciate the opportunity of sending complete copies on approval to supervisors and teachers.

Make Chamber Music Interesting

By Dr. Perry Dickie

CHAMBER music, in the minds of the average person, and it would seem as well in the case of some musicians, consists of only string quartettes, alone or with piano, or else trios consisting of piano, violin and 'cello. At the present time these several combinations, figuratively speaking, are crammed down the throats of the musical public.

We grant the value of these forms of composition and the artistic excellence of the many organizations playing them and thus keeping green the memory of the composers of this music, also the worth of these works for the purpose of study and practice for the players on string instruments. In fact, we have spent many hours in playing 'cello parts in these compositions and regard such time most profitably employed.

However, in the Gilbert and Sullivan's "Patience" one of the characters gives a dissertation on the subject of a continuous diet of candy, which he tells us after a time becomes monotonous.

We fail to see why the continual listening to string quartettes (and trios) with no change should be any exception to the rule.

We wonder how many are aware that the term chamber music has a much wider scope and significance than the above very limited combinations of instruments. There are many other forms of chamber music containing instruments not included in the above. For instance, the woodwind—the glory of the modern orchestra—consisting of flute, oboe, clarinet and bassoon. Then of the brass there is the superb (French) horn. All these in various combinations, either with or without piano, organ or strings, are most entrancing to listen to and have the advantage of possessing an individuality that is not found in the strings, as delightful as they are.

For some unaccountable, if any at all, reason these forms of chamber music are seldom given an opportunity to be heard, notwithstanding that there are many superb players on wood-wind and horn in our large cities.

This form of music is preferred by many musicians to the string combinations.

Music for these chamber ensembles has been in existence from the times of the old masters, all of whom have had some hand in its making, which they played in their time, and which was enjoyed by those who seemingly possessed a higher musical appreciation than we of the present, who permit these beautiful works to remain unknown notwithstanding our much vaunted claims to an ultra-musical understanding and intelligence.

Importance of a Good Violin and Bow at the Start

By C. F. Nagro

STUDENTS of piano and various other instruments are, as a rule, favored in having a better grade of instrument than violinists are at the start. Parents do not think anything of spending several hundred dollars for a piano or close to one hundred for a band instrument; but when it comes to a violin they usually select the cheap grade. They do not know that the beginner as well as the advanced student must have good tools in order to do good work and achieve good results. The art of violin playing will advance to a more artistic point when students are given better violins and bows to practice with. But aside from the tone quality, which ought to be the first consideration in a violin, the cheap grade instrument has many other faults. The adjustments are not properly made; that is, the bridge and sound post are not set right. The neck does not have the proper setting; and the pegs are not properly fitted to the violin. The beginner, because of the poorly fitted pegs, is often afraid to move them in order to tune the violin, consequently does his practicing on a violin out of tune, which is of no benefit musically. Madame Galli-Curci says that to be a singer one must have the singer's throat. Violin students must have a good instrument to become good violinists.

The bow should be a good one, too; no use in trying to get a good tone from a violin, with a poor bow. It should be examined very carefully to see that it is not warped and that it will retain its curve when tightened. The hair must also be of good quality; if not, it should be replaced by a good violin repairer.

A good dealer who has a reputation to lose is the one from whom to buy the proper violin; if in doubt as to the value and fitness of the violin (also correct size required by the student), the advice of a competent violin teacher should be secured before buying the instrument.

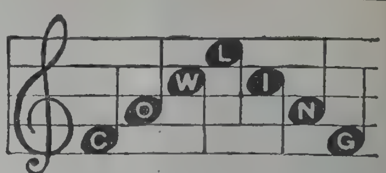
The Steel E String

By Robert Girvan

MY experience in getting a good tone from steel E strings may be of interest. Some years ago, when buying a bridge I noticed a mark along the edge; and on closely examining it I found it was made up of three pieces of wood neatly glued together. This gave me an idea, so I had a friend strip the top of a bridge and glue on a piece of ebony, so that the strings would not cut into the wood. This saved changing the bridge for a longer period. I notice now that many bridges are commonly sold with a little piece of ebony inlaid in the bridge, only where the E string rests, thus preventing the steel E cutting into it, as ebony is an extremely hard wood.

But the steel E string did not sound well enough to me, so I did some experimenting. First, I tried very fine brass, then soft and hard steel, on top of the bridge, under the string, and still I did not get the desired effect. Now I have a piece of common tin, about an eighth of an inch broad, cut in diamond shape,  and folded over the bridge on each side, no more than a quarter of an inch long. The effect is surprising. Not only does it prevent the string cutting into the bridge, but it also takes the steely, metallic ring away; and it does not mute the tone, as when the string lies directly on the wood. It gives a perfectly clear tone, and when playing it would be hard for any one to distinguish it from the tone of a gut string.

I ought to add that a tiny groove in the center of the tin protector keeps the string firmly in position.



TECHNIQUE WITHOUT DRUDGERY
For Pianists — Violinists — 'Cellists

Reading Music at Sight; Rapid Fingering; Flexibility of Fingers, Wrist and Arm; and a Fine Vibrato acquired by a Few Minutes' Daily Practice away from the Instrument. No apparatus.

A Pianist writes: "A friend of mine (who is a fine performer) recommended me your Course, and after three lessons I find my technique greatly improved. I shall certainly recommend them to all my pupils, and also to my colleagues. YOUR DISCOVERY OUGHT TO FORM PART OF THE CURRICULUM OF ALL THE COLLEGES OF MUSIC."
ANGELO PICCIONE.

PITTSBURGH SCHOOL OF MUSIC
March 28th, 1923. Pittsburgh, Pa.
"I thank you for your recent letter, and you may depend upon my doing all I can to spread the Cowling gospel. Really, I have found the exercises remarkable. I have been before the public as a soloist for a number of years, and I want to say that the Cowling System has saved me many hours of practice already. I CONSIDER IT MY DUTY TO RECOMMEND THE COWLING SYSTEM."
GAYLORD YOST,
Head of Violin Dept. and Composer.

DICTION FOR SINGERS and COMPOSERS

By Henry Gaines Hawn

Well-known Authority on the Spoken Word and Good Diction in Song

Teachers of singing, as well as all singers and students of singing, should read this treatise on the proper word expression in singing. The author clearly shows that *expression* in singing may be actually interpretive of the text. Many great singers are preeminently great because they accord texts their full importance. Composers, great and small, will find this an invaluable guide to proper setting of words.

Violin Questions Answered by Mr. Brain

trings Breaking in Hot Weather.

P. S. G.—Everyone has more or less trouble róm breaking strings in hot, damp weather, ut your 'cello strings should not break as equently as you say they do. Probably our strings are not of good quality, although ey may be sold to you as "the best." Per-oiration breaks more strings than anything lse. Sometimes the edges of the nut are oo sharp and cut the strings where they go to the string box. In that case you could ound off the edges with a little file or some onvenient instrument. The notches of the ridge and nut should be shallow, and in the ase of the 'cello it is a good idea to rub oap into the notches of both bridge and nut. —Maybe you tune your 'cello at too high a itch. You should not tune it higher than ternational pitch. Of course, I cannot tell efinitely what the trouble is without seeing e 'cello and trying out the strings which ou use.

he Violinist's Equipment.

M. D.—Not having heard you or your iend play, it is quite impossible for me to y and predict whether you could learn to lay as well as your friend. Progress in violin laying depends on talent, industry and nat-ral aptitude for the instrument. One vio-n student may make four times as rapid rogress in the same length of time, as an-her. 2—It is quite impossible for one to ecome an artistic player on the violin with-ıt a long course under a teacher, and a ery good teacher at that. 3—Starting from irteen to sixteen years of age, it is pos-ble for one to become a creditable player, ıt not a violinist of the highest rank. eally great players commence before ten ears of age, most of them at five or six. —Your previous study of the piano will be great assistance in your violin study. hether it will balance your friend's two ears' earlier start on the violin I cannot say. 5—Your 5th question reads, "In teaching myself, what is the best course to follow, etc.?" From this I presume you are going to try to learn without a teacher. If I were you I would try by all means to get a teacher; but if circumstances will not permit, get "Dancla's Conservatory Method for the Violin," as this has a great many explanations.

A Stradivarius.

H. J. W. M.—Take or send your supposed Stradivarius to one of the dealers in old violins who advertise in THE ETUDE, and they can give you an opinion. It is impossible to judge without seeing the violin.

Stiff Joints.

J. L. Z.—Unless you have stiff joints caused by rheumatoid arthritis, or stiffness caused by some accident to the joints, I do not think that massage would help you in acquiring a correct vibrato. You would get better results if you spent the money you would spend for massage, in lessons from a good teacher, who could show you how to acquire it. Get a copy of the November, 1922, ETUDE, which has an article on the subject, also the following books: "Violin Vibrato, Its Mastery and Artistic Uses," by Siegfried Eberhardt, and "Violin Teaching and Violin Study," by Eugene Gruenberg. 2—You will get as good results from the above works as you would trying to learn the vibrato by a course of lessons by mail. Best of all, go to a good teacher. 3—There are excellent musical institutions in your city, where you can get expert instruction in every branch of violin playing.

Order Music.

A. J. G.—Order the composition named from the Theo. Presser Co., 1712 Chestnut St., Philadelphia, Pa.; and, if there is an arrangement published for violin and piano, they can obtain it for you.

Letters from "Etude" Readers

Correct Applause

o THE ETUDE:

A feeling of mutual confidence and sym-athy should be established and maintained roughout a program. The opinion of an udience as to the merits of a performance, id more especially if this be favorable, is of reat moment to the performer; and the mani-station of this is, without a doubt, very recious to the aspirant for public favor.

Primitive audiences still sometimes vent ıeir spirits in stamping the feet, pounding ith canes, whistling, cat-calls, or shouting. ore sophisticated audiences substitute hand-apping. Even this may be considered offen-ve and having a tendency to destroy the notional effect of the music. It practically ears down the temple of ideal beauty reared y the performers in the imagination of the udience. After all this hand-clapping is but a inheritance from barbarous ancestry.

The writer at one time had a part in a nefit recital for a Swedish Lutheran congre-ation, in their own building. Just before e program began the minister came to us nd explained that their church rules forbade e ordinary applause in the audience room.

I thought, "Good-night! How interesting at will be!"

"But," continued the minister, "I have sked the audience to use the Chautauqua alute."

To me that was rather misty. However, as e retired from the rostrum after the first umber I heard a "wish, wish, wish, wish"—sound like the rustling of wings. Glancing ack, I saw the air full of kerchiefs, programs, nd fans; and the sound sifted down on our rs as gently as confetti. I felt scarcely com-limented, but knew the audience were doing e best they could.

By the time the program was finished it had ercolated into my comprehension that in this lmost silent applause there was expressed ıst as much sincerity and genuine apprecia-on as in the ruder hand-clapping; and it ft as an aftermath a consciousness of re-ıement and—I may say—spirituality that as enlightening.

Is it not possible to substitute a more refined yet satisfying method of expressing approval than the customary one?—I. J. Cogswell.

Where There is No Teacher

TO THE ETUDE:

When my husband and I went to live in the mountains, two hundred miles from a good piano teacher, I ruefully gave up all hope of continuing my piano practice, until the idea occurred to me. This idea was that of buying the phonograph records made by the world's finest pianists of whichever new composition I chose to study, and then really studying by ear, with the piano music before me.

The advantages of this sort of study are many. While not equal to instruction by the best teachers (besides not being applicable to students in the lower grades), yet for those who like myself have progressed into the higher grades and would like to continue study where no teacher is in sight, real help and inspiration are gained from these recorded renditions.

Lately I have bought *Hungarian Rhapsody No. 2* by Liszt, as played by Josef Hoffman on the Brunswick record; some others (also Brunswick records) by Elly Ney, and several miscellaneous records, by Rachmanioff, Olga Samaroff, and others. Instead of struggling along with my own interpretations, I am guided by those masters. Do I forget the shading of a passage, or imagine that my cadenzas do not ripple rapidly and smoothly enough, I have but to renew the needle and again listen to an exquisite rendition, which resets my target for more accurate aim.

Even were I fortunate enough to obtain a good teacher here and now, I feel that it would be an error to discontinue practice with and study of these well-played records, for they give me a tangible measuring-stick by which to gauge my attainments, and, as well, give me an invaluable incentive to work.

MRS. HARRY EATON SMITH.

New Music Books Reviewed

Hygiene of the Voice. By Irving Wilson oorhies, M. S., M. D. 205 pages; bound in oth with illustrations. Published by the acmillan Co. Price $2.50.

A valuable book by a noted New York ecialist who has frequently contributed lpful articles to THE ETUDE MUSIC MAGA-NE. The book is very valuable for the nger, the teacher and the student. It tells w to care for the voice in health and in ckness. In many ways it gives the last ord in prescriptions for colds, hay-fever, ıd throat infections. In this way it is orth many times its cost, in expert medical es. Dr. Voorhies has for many years been tained by leading singers in the great opera mpanies; and his opinion is sought by ncert singers in all parts of the country.

Church Music. By E. S. Lorenz. Cloth und; 246 pages, with illustrations and usic examples. Published by Fleming H. evell, at $3.50.

Although the experienced author of this table work has had in mind the need of forming ministers about church music—need which organists know only too well—e book has far wider usefulness than that merely filling the requirements of a good ok for the theological seminary. In the apters on the "Philosophy of Musical Sounds" and "The Psychology of Music," the author has attempted to acquaint the uninitiated individual with those principles of notation, tone, intervals and general musical knowledge, without which no one can get an intelligent grasp of the subject. The chapters on the "History of Church Music" and "The Pipe Organ" are equally valuable. This work is one which we can strongly recommend for the library of the organist as well as that of the clergyman.

The Principles and Methods of Musical Criticism. By M. D. Calvocoressi. Bound in boards; 148 pages. Published by Oxford University Press, American Branch, at $2.20 per copy.

A book of the greatest value to the student of musical criticism. Especially the one who aspires to the writing of such criticisms will find in it many helps as to how to approach his work: his attitude towards the work in question and his public; his method of handling, and presenting his materials; the formation of his judgments and the wording of them so as to make clear his feeling in the matter. A reliable guide as to what to say as well as what were better left unsaid.

Piano Selections

from

Best Known Grand Operas

The following piano selections were formerly obtainable in SCHIRMER'S LIBRARY. An insistent demand has caused us to publish them in separate series at the reduced list price 75 cents each. The excellence of the edition is an acknowledged fact. We list the operas below and solicit your interest.

Improve Your Knowledge of Things Musical by Enjoyable Reading in Summer Spare Moments

THEO. PRESSER CO. Music Publishers and Dealers
1710-12-14 Chestnut St. Established 1883 Philadelphia, Pa.

The leading musical educators are well informed musically and to be at home in music circles the music lover must have a store of knowledge upon musical subjects. It is well to remember that the student of today is to be the successful musician of tomorrow or perhaps, because of neglected opportunities to improve, but a mediocre one or a failure. With such books as listed on this page obtainable at reasonable prices it would be a pity for anyone interested in music not to utilize some available time this summer for music reading.

Secrets of the Success of Great Musicians

By Eugenio Pirani

A series of biographical studies of the great masters written by a well-known teacher, pianist and composer. With keen perception Mr. Pirani has penetrated the philosophy of the life success of these great music masters, quite a few of whom were personal acquaintances, and reveals them to the reader with a writing charm that is irresistible. Illustrated.

Cloth Bound, Price, $2.00

Music and Morals

By H. R. Haweis

Very few books in the history of the art have had more influence in stimulating an interest in music than this work. It contains over four hundred pages of fascinating reading matter including essays upon musical subjects, biographies of the great masters and an instrumental section in which a chapter on carillons is especially noteworthy.

Cloth Bound, Price, $2.00

Music Study in Germany

By Amy Fay

No music lover, young or old, can fail to be instructed and charmed by these delightful musical letters of Miss Fay, written when she was under the inspirational influence of Liszt, Tausig and Deppe. The book is chock full of real pedagogical information.

Cloth Bound, Price, $1.75

Reminiscences of a Musician's Vacation Abroad

By Louis C. Elson

Some observations and experiences of a number of European trips in pursuit of musical history research, taken by Mr. Elson, presented in his own inimitably humorous manner. A most excellent book for summer reading.

Price, 75 cents

Standard History of Music

By James Francis Cooke

This history is told in story form—so clear a child can understand every word—so absorbing that adults are charmed with it. Just the thing for amateurs, concert-goers and self-study pupils. Handsomely illustrated.

Cloth Bound, Price, $1.75

Musical Sketches

By Elise Polko

This book will not only entertain the reader, but will prove instructive as well. The sketches of the composers are founded on facts with stories woven around them. Illustrated.

Cloth Bound, Price, $1.50

Anecdotes of Great Musicians

By Francis W. Gates

A unique and interesting collection of three hundred well authenticated anecdotes of great composers, players and singers told in an entertaining style and embodying much valuable musical information.

Cloth Bound, Price, $2.00

First Studies in Music Biography

By Thomas Tapper

Each biography is the result of careful study; it is direct, readable and never heavy. With each composer there is given a portrait and illustrations of his life and works. This book will prove most excellent reading material for young students of music.

Cloth Bound, Price, $1.75

The Music Life; and How to Succeed in It

By Thomas Tapper

This book presents numerous phases of art and art-life in a thoroughly practical manner. It points out the way of success to music teachers and students.

Cloth Bound, Price, $1.75

Musical Progress

By Henry T. Finck

A series of practical discussions upon interesting matters in the "tone-world" of today, making informative and entertaining material for anyone interested in music. There has been no other musical literature work in recent years that has received so much favorable comment from critics and others high in the musical world. Those loving music will find this book a real "treat."

Price, $2.00

Great Singers on the Art of Singing

By James Francis Cooke

Twenty-seven foremost artists of opera, oratorio and concert have contributed to this book chapters giving advice and suggestions based on their own personal experience. Each chapter is preceded by a full-page portrait and short biography of the artist. An invaluable book for voice teachers and students, concert and opera-goers and phonograph owners.

Cloth Bound. Price. $2.25

Choir and Chorus Conducting

By F. W. Wodell

A complete manual of information on the organization, management, training and conducting of choirs and choruses, with an added chapter on home, community and school orchestras.

Cloth Bound, Price, $2.00

Life Stories of Great Composers

By R. A. Streatfield

The lives of great composers are charts to enable us to navigate our own careers. They show us the rocks to avoid and the ports to make. This book contains thirty-five biographies, each followed by a chronology of the composer. Illustrated with full-page portraits.

Cloth Bound, Price, $2.25

Old Fogy, His Musical Opinions and Grotesques

By James Huneker

A collection of exceptionally original critical observations from the pen of the late James Huneker, considered by many to be his most interesting work. It is undoubtedly one of the most frank expressions of opinion on musical matters in print.

Cloth Bound, Price, $1.25

EXCELLENT ALBUMS OF PIANO MUSIC

Offer a convenient and an Economical Method of having at hand a Variety of Material for Summer Playing.

BRAHMS' ALBUM

Edited by Louis Oesterle. Price, $2.50

All of the more frequently played piano compositions of this master.

Great Pianists on Piano Playing

By James Francis Cooke

A series of thirty-six educational conferences with renowned masters of the keyboard, presenting the most modern ideas upon the subjects of technic, interpretation, style and expression. An entire chapter is devoted to each artist, supplemented by an excellent portrait and biography. An absorbingly interesting book that should be read by every teacher, student and performer of the instrument.

Cloth Bound, Price, $2.25

Piano Playing with Piano Questions Answered

By Josef Hofmann

In this informative book one of the foremost contemporary pianists has written nearly one hundred pages of essays and answered two hundred and fifty questions bearing on piano playing. This book is highly recommended to piano teachers.

Cloth Bound, Price, $2.00

Mistakes and Disputed Points in Music and Music Teaching

By Louis C. Elson

It is a magnificent thing to have positive information and this work will straighten out many a slip-shod musical education. It covers all the essential points from acoustics and notation to piano technic and orchestration. An ideal book for spare-time reading.

Cloth Bound, Price, $1.50

Celebrated Pianists, Past and Present

By A. Ehrlich

Containing one hundred and fifty portraits and biographies of European and American pianists of the past and present, this work is one of the most reliable books on musical biography published. The volume is most attractively bound and would make a very desirable and appropriate gift for a musical friend about to start on vacation.

Cloth Bound, Price, $2.50

The Education of the Music Teacher

By Thomas Tapper

A most important work for all teachers who aspire to conduct their profession on lines most widely approved in modern music study. It contains valuable suggestions on the selection and use of teaching material.

Cloth Bound, Price, $1.75

Descriptive Analyses of Piano Works

By Edward Baxter Perry

A poetic, dramatic and historical analysis or description of some of the greatest and best known piano compositions by Chopin, Beethoven, Liszt, Weber, Schumann, Grieg, etc. These descriptions undoubtedly will aid the player to a better understanding of the piece in question or its interpretation.

Cloth Bound, Price, $2.00

Stories of Standard Teaching Pieces

By Edward Baxter Perry

This captivating book has helped and inspired thousands of teachers and pupils. It is a companion volume to *Descriptive Analyses of Piano Works* and is even more interesting and useful, as it deals with pieces from the third to the seventh grade by such popular writers as Godard, Rubinstein, Nevin, Schytte, etc.

Cloth Bound, Price, $2.00

Well-known Piano Solos; and How to Play Them

By Chas. W. Wilkinson

A wealth of material to play, study or teach is suggested by these one hundred and fifteen descriptions, or lessons, on as many famous piano compositions. They furnish just the touch needed to enjoy further one's playing. Performers will find this book an invaluable aid in assisting them to give an artistic rendition of the best piano solos.

Cloth Bound, Price, $2.00

Text Books for Summer Music Classes

Many years ago we presented in the columns of The Etude a suggested plan of study for Musical History with the *Standard History of Music*, by J. F. Cooke. It was merely to point out that the forty chapters of this book could be divided into sections of five chapters, so that the course would last the eight weeks of the summer. This, together with the lists of talking machine records given gratis to all teachers, enabled the class leader to conduct a profitable and interesting mid-summer course, even though the leader had no previous experience in teaching the subject of musical history. There are a number of subjects which may be taught in similar way by any musician versed in the subject. Harmony is one of them and for this purpose we recommend the *Beginner's Harmony Book* of Preston Ware Orem, a delightfully simple work for young and old. Technic may also be given special attention in this manner. *Philipps' Complete Technic*, and *Mastering the Scales*, by J. F. Cooke, make excellent material for this purpose. Any of these works may be had for examination, and teachers who contemplate conducting summer music classes are invited to write to the publishers for any particular information desired.

Summer New Music Packages

Following our usual custom, we will send two or three packages of NEW MUSIC during the summer months to all patrons wishing to receive them. These packages are particularly valuable for teachers who continue their work throughout the summer term, as many of our teachers, especially those in small towns and rural sections, have been doing in recent years. This music is sent on our regular ON SALE terms, being billed at our usual liberal professional discounts, and all copies remaining unsold at the end of the season may be returned for credit. It will be necessary for our patrons to notify us if they desire to receive this music, as packages will be sent only to those ordering them especially for the summer season. Kindly mention grades desired of instrumental music and range of voice required in the songs.

Two New Songs
By Chas. Wakefield Cadman

All singers and voice teachers among Etude readers, will be delighted to learn that the THEODORE PRESSER CO. will, in the near future, publish two new songs by the celebrated American composer, Chas. Wakefield Cadman. *Reeds*, a dainty love song set to a short poem by Juanita Roos, is a perfect little gem, and *In the Garden of Sahara*, with text by Chas. O. Roos, is a more dramatic song with a touch of the Oriental. These are not complex songs, neither are they too obvious. They are real singable numbers, not too difficult for the average singer nor for the accompanist, and yet of sufficient merit to warrant their inclusion in the repertoire of the foremost artists of the concert stage. We are proud to be publishers of two such fine songs, and believe that when our patrons become acquainted with them, they too, will share our enthusiasm.

Three Months' Trial Subscription to Etude Music Magazine

Here's an opportunity to introduce Etude Music Magazine to your musical friends and acquaintances. We will take pleasure in sending The Etude to any person not now a subscriber, for the months of June, July and August, at a special introductory price of 35 cents, cash to accompany order. Every music lover, student and teacher, should be a permanent reader of our educational and interesting publication. Here's the opportunity to get acquainted. A mighty fine gift from any earnest teacher to her pupils.

The Cat Concert
By Russell Snively Gilbert

This is a set of first grade pieces, six in number, published in attractive book form. All our books of little pieces for young players and written by composers who make a specialty of this line of work, are very successful. Mr. Gilbert is a recent addition to our ranks and his new work, *The Cat Concert*, should prove very attractive. These are genuine first grade pieces. The titles are as follows: *The Cats March In, Professor Cat Sings a Prayer, The Prize Cat Fiddles, The Three Black Cats Play a Trio, Kitty Kitten's Dance, The Moonlight Glee Club Sings.*

The special introductory price in advance of publication is 35 cents per copy, postpaid.

New Theory Book
By Preston Ware Orem

This new book is now well under way in preparation. It may be described as a practical text book in musical construction. To take up this work it is only necessary to have a first-year knowledge of harmony; by this we mean intervals, scales, common chords and the dominant seventh chord. Instead of wading through a complicated mass of so-called advanced harmony, the student is led immediately into creative work and develops a fuller and more complete knowledge of theory through the things that are necessary to be done in actual writing. Melodic invention, the writing of accompaniments, modulation, etc., are learned all the better through this natural and practical method of presentation.

The special introductory price in advance of publication is 60 cents per copy, postpaid.

The Vision of Deborah
A Sacred Cantata
By Richard Kieserling

Choir-masters and directors of choral societies will hail with delight a sacred Cantata suitable for all seasons of the year and appropriate for programs which are thoroughly ambitious. This Cantata requires about thirty-five minutes and has a sufficient number of solos to engage the interest of well-trained singers in all voices.

The story of the Cantata is taken from the Fourth Chapter of Judges, and has been slightly versified in order to make it suitable for musical treatment. The music is redundant with dramatic climaxes, opening as it does with the "Worshippers of Strange Gods," which has an Oriental flavor and this is followed by the soprano solo, "The Vision of Deborah," in which a full chorus is used with soprano obbligato. The entire Cantata is melodic but is not too obvious, nor is it easy to prepare effectually for the correct interpretation.

In order fully to appreciate the working out from this opening through the battle scene and the grand climax of praise, one must have the copy of the score. We take great pleasure in introducing what we believe to be the most unique sacred writing of the present time and we take great pride in the character of the work. Our advance of publication price for one copy only, is 30 cents.

Pageant of Flowers
Operetta for Children
By Richard Kountz

Pageant! Pageant! Everyone wants a pageant! Here is a short half-hour play in which there is much of beauty and charm. There are dances and vocal numbers and a little dialog to explain the story. The pictures, or scenes, are lovely and the music is bright, tuneful and catchy. The songs are the songs children love to sing. The stage business is extremely simple, easily learned and inexpensive.

Our advance of publication price for one copy only is 35 cents.

Organ Score Anthem Book No. 2

This is a work that has come into our hands from another publisher. It enjoyed an enormous sale in the past. It is a work suitable for choirs in smaller places where there is a chorus of average attainments. The composers represented are mostly on the order of *Adam Geibel, J. R. Sweney, Wm. J. Kilpatrick.* The work is still very popular in certain sections and will continue so for many years to come. All the anthems are written in short score instead of in six staves, thus you have a greater amount of music in the same space. There is nothing very difficult in the whole work, the only number of any pretensions is *Mozart's "Gloria," from the "Twelfth Mass."* Since the plates are ready, the work will be on the market in a short time. Therefore, those wishing to avail themselves of the low price before publication, will have to act very quickly. Only one copy will be sold to each purchaser.

Our special advance of publication price is 35 cents per copy, postpaid.

Pedal Studies for Organ
By Ernest H. Sheppard

There is a considerable demand for studies of this type. After the first instructor for the organ has been mastered, the student needs to attain a certain feeling of comfort and freedom in the pedaling. This is only gained by a thorough knowledge of the "geography" of the keyboard, obtained through a careful study of the scales. In Mr. Sheppard's studies, each scale is given first with the correct pedaling marked, then there is a short exercise for manuals and pedals introducing appropriate passage work and designed to inculcate a certain amount of independence of hands and feet. This is a most useful exercise book adapted to follow any instructor.

The special introductory price in advance of publication is 30 cents per copy, postpaid.

Rhythms for Young People
By Blanche Fox Steenman

This work is a collection of well-known piano pieces mostly of grades two and three. The selections are all from the most popular good music played at the present day. Among the marches will be found, *March of the Priests—Mendelssohn; March Militaire—Schubert; Anvil Chorus from "Il Trovatore"—Verdi; Bridal Chorus from "Lohengrin"—Wagner; Coronation March from "The Prophet"—Meyerbeer; Festival March—Gounod; Funeral March—Chopin.* The selection of waltzes is somewhat similar and so it runs through the entire work. Several of the numbers have been arranged especially for this book. It is intended primarily for public school work and to be used also in connection with musical appreciation. This work contains a vast amount of music. *Mr. John W. Beattie,* Director of Public School Music, Grand Rapids, Mich., has the following to say: "If the development of the rhythmic sense is to lead to proper ends, the teacher should make use of only such music as will bring the children into early contact with the compositions of master musicians. Too often, rhythms are brought to children's attention through the cheap and trivial compositions which lie so handy upon the counters of music dealers. Fortunately, there is a wealth of material which may be fitted into school use and through hearing this music the children may be brought into daily contact with music of a high order. But teachers have not always known what that material is, nor where to obtain it." Primarily this work was intended to teach rhythm and there is a place for such a work not only in public schools but with each practical teacher of the piano. We are looking forward to a great success for this book.

Our special advance price is but 50 cents per copy, postpaid.

Basic Principles in Pianoforte Playing
By Josef Lhevinne

This book is now up in page form awaiting binding. It will, therefore, be withdrawn from special offer very shortly. It is one of the clearest, cleanest-cut presentations of the main principles of pianoforte playing we have seen. It is a series of matter-of-fact conferences with this great pianist upon just those points about which the average pianist wishes information. The advance of publication price is 30 cents per copy, postpaid.

Little Folks' Music Story Book
By James Francis Cooke

This is what might be called a "first reader" of musical history, the very first book to be put in the musical child's hands as soon as he is able to read. The pictures will come on a separate sheet to be pasted in the indicated spaces. It will be a delightful pastime for little folks. Advance of publication price is 50 cents per copy, postpaid.

New Instruction Book
By John M. Williams

The plates of this work are at last completed and ready. We almost owe our advance subscribers an apology for the long delay in bringing this out, but we can positively promise the work before the next issue of The Etude. The author of this work is making a tour of the United States, establishing teachers' Normals in various cities. This tour is going to last the entire season of 1924 and 1925, ending in New Orleans the last of next year. Information of this important movement can be had by addressing *Mr. John M Williams, 326 Underwood Block, Calgary Alberta, Canada,* or direct to us and we will gladly send full particulars of his undertaking. This is very important to the music profession. Each Normal class will last but two weeks and this work will be used as a text book. One of the features of the book is the beginning at once with both clefs, which is now becoming more and more popular.

The special advance price for this work during the present month is 40 cents per copy, postpaid.

Album of Scales For the Pianoforte

This will be the last month in which this work can be purchased at a reduced rate. The plates are all selected and made. It will be similar to the volume we recently issued on *Trills*, and our next volume of this series will be of *Arpeggios*. *Album of Scales* is intended to make the study of music pleasant. It teaches the scales, not in the former way but through scale passages in pieces and only those pieces have been selected that are interesting musically. Anyone who has studied a year should be able to take up this work. It should be the aim of every teacher never to lose sight of improving the technic of the pupils. In the study of music, this is a very important feature. The mere amusement, a tickling of the senses with saccharine material, is not to be recommended. The matter of constant technical improvement should be kept in view. This is an excellent work for this purpose.

Our special advance price for the coming month will still remain the same, that is, 30 cents per copy, postpaid.

The Castaways—Operetta for Women's Voices
By Fay Foster

Fay Foster's music is always melodic and charming and in this operetta she has a story which adds much to the interest of her musical setting.

An evening's entertainment is here provided which is most attractive to the eye because of the quaint, curious costumes of the native women contrasted with those of the shipwrecked Americans and to the ear because of the weird wailings of the incantation scene interrupting the sensuous music of the inspirational dance of *Gladys*. There are many surprises in the action of the play, many delightful musical numbers and the dialog is particularly up-to-date. Our special price in advance of publication for one copy is only 40 cents.

What to Play—What to Teach
By Harriette Brower

Expert guidance upon a subject which often sorely puzzles the pupil as well as the young teacher, is what this book gives in generous measure. Miss Brower, living in the heart of things musical for years, has had a wonderful opportunity to pick out the pieces which make the best impression in all grades, describe them analytically and arrange them in program form. Of course, such a book is very valuable for the student. The advance of publication price is 75 cents, postpaid.

Notturno—A Musical Romance
By Carl Schmidt

Musical fiction of interest is really quite rare. There are comparatively few novels with a genuine musical background. Some writers have attempted to present stories with musical characters but because they have known so very little about music the result is often ludicrous. Here is a musical novel written by a professional musician with long experience in New York City. It has a good plot, is well motivated and is one which musicians will read with great pleasure.

The advance of publication price is 80 cents per copy, postpaid.

Holberg-Suite for Piano
By E. Grieg, Op. 40

This new volume in the Presser Collection is very nearly ready. *Grieg's Op. 40* is a work which is increasing in popularity. In this *suite*, Grieg practically departs from his usual nationalistic style and harks back to the classic period. The *Prelude*, *Sarabande*, *Gavotte*, *Aria* and *Rigaudon*, are all very clever idealizations in the style of the ancient dances. Either complete or singly, these pieces will make splendid program numbers. In point of difficulty the entire work would be graded about five.

The special introductory price in advance of publication is 25 cents per copy, postpaid.

Jolly Jingles for Little Fingers
By Helen L. Cramm

The composer of this little book has a long line of successes to her credit. She excels in teaching material of the early grades. The young music students of today are fortunate in the wealth of tuneful and interesting material which is set before them. All the old-fashioned dry and pedantic material has been replaced by something attractive and worth while. *Jolly Jingles for Little Fingers*, is a set of pieces that will be enjoyed greatly by young pupils. Although these pieces are in lively style, they are nevertheless of real educational value.

The special introductory price in advance of publication is 30 cents per copy, postpaid.

Principles of Expression in Pianoforte Playing
By Adolph F. Christiani

A more important work on playing the piano has not come from any press in many, many years. Phrasing is the very life-blood of music, and any book which introduces one to the secrets of this art is invaluable to the library of either teacher or student. This Mr. Christiani's book does by going to the very bottom of the matter and giving a clearly understandable presentation of the principles of *Rhythmical Accents*, *Metrical Accents*, *Melodic Accents* and *Harmonic Accents;* each one of which has a most important part to play in the proper interpretation of the true spirit of a composition. The first edition of the book had such a lively sale that it has been out of print for some time, and, in bringing out this new edition, we feel that we are doing a real service to the musical profession. The work is well adapted to class use, in any grade above the second, as well as for a reference book to be kept on the study table.

Special advance of publication price, $1.50 per copy, postpaid.

The Fairies' Revelry Operatic Cantata
By Richard Kieserling

With or without staging, this cantata is very lovely. The music is not too difficult for school use but is interesting enough for women's clubs to include on regular programs. The solo voice used is soprano and the choruses are in three-part writing. There is much variety in the story of the text and Mr. Kieserling has splendidly caught the atmosphere of each number in his musical setting. The time required for rendition is about a half hour. The staging is very easily and inexpensively done. The advance of publication price for one copy only is 30 cents.

The Amateur Musician
By Russell Snively Gilbert

This is a primary book which may be used to supplement any beginner's book and it furnishes stimulus from the musical rather than the technical side. These little exercises tend to develop the creative side of musical study and to promote a good working knowledge of the rudiments. We feel sure that no teacher will be disappointed in this little work.

The special introductory price in advance of publication is 30 cents per copy, postpaid.

First Lessons in Bach
By Walter Carroll

This is one of the most popular of all Bach collections. The majority of the pieces included were originally written for the instruction of Anna Magdelena Bach, and to these have been added some other numbers chiefly from the suites. This is Volume One of the original compilation by Walter Carroll. Our new edition has been prepared with the utmost care and will be gotten out in fine style. This book may be used to precede the *Little Preludes of Bach*, and constitutes the beginning of a course in Polyphonic playing.

The special introductory price in advance of publication is 20 cents per copy, postpaid.

Reverie Album for the Piano

A collection of this type may be used for a variety of purposes. It would be available at any time where an Album of *Sunday Music* is called for. Many of the selections might also be used at church services where a piano replaces the usual organ. For certain types of movie playing also, this book would prove handy. And finally, it is a book for home playing of the quieter and more elegant type. It is a volume of carefully selected pieces of the intermediate grade, all of which are in the style of *Reveries*, *Nocturnes*, *Songs Without Words*, *Meditations*, etc. Every number is a gem from one of the best writers of music of this style.

The special introductory price in advance of publication is 35 cents per copy, postpaid.

Thirty-six Studies or Caprices for Violin
By F. Fiorillo

Our new edition of these celebrated violin etudes is about ready for delivery to advance subscribers. It has been edited by Otto Meyer, pupil of Prof. O. Sevcik, and his successor in this country, a musician well qualified to undertake a work o this character. These etudes provide excellent material for practice in double stops, stretches and smooth passage work and are so musical that many of them are used for concert purposes. Every violin teacher will be interested in this splendid new edition, and we suggest the immediate placing of your order if you wish to take advantage of the special advance of publication price, 35 cents, postpaid.

Music Writing-Book
By Anna Heuermann Hamilton

This is a work intended not only as a writing-book, but as an introduction to theory. It can precede the study of harmony. It contains many elements not found in similar writing-books. Where a pupil is not very well advanced in rudiments of music, this work will supply excellent material. It is a little higher in grade than the average writing-book. On every page of the book there is some practical work to be done, but it does not require an extra blank book. This work is about ready to go on the press and will be withdrawn next month.

Our special advance price for the work is but 20 cents per copy, postpaid.

An Extraordinary Premium 42-Piece Dinner Set

We have arranged with a well-known manufacturer to supply us with dinner sets consisting of the following:—

6	9⅙ in. Plates
6	6½ in. Plates
6	Teacups and Saucers
6	5¼ in. Fruits
6	6¼ in. Oatmeals
1	10¼ in. Meat Platter
1	7¾ in. Salad
1	9⅙ in. Salad
1	Creamer
1	Sugar Bowl (covered)

The decorations are simple in design but attractive and present a splendid appearance. The ware is not clumsy and heavy, but light and dainty. It is a set of which you can be proud. We will deliver this dinner set anywhere in the United States for only 14 new subscriptions. The same in Canada, plus duty.

Swindlers

We again remind our Etude friends to place no orders for Etude subscriptions with anyone unless the agent is personally known to them. We cannot be responsible for any money paid to strangers. Beware of the man posing either as a student working his way through college or an ex-service man trying to turn an honest penny. Smooth tongued swindlers offer plausible yarns, but daily receipt of complaints from all over the country show that crooks are mighty active.

Summer Magazine Prices

Look over the magazine offerings on the inside cover of The Etude. Any combination is a good combination, and your selection is bound to save money for you.

(*Continued on page 432*)

The World of Music

(*Continued from page 365*)

"I Pagliacci" recently had a presentation in Palestine, in Hebrew. The programs were printed in Hebrew, Arabic and English; while also advertisements in French were included.

Leopold Stokowski was recently nominated by the Prince of Wales, a Fellow of the Royal College of Music of London. Dr. Stokowski is a native of the British metropolis and is a graduate of Oxford as well as of the Royal College of Music.

John Philip Sousa and Victor Herbert were among the members of a committee from the Society of American Authors, Composers and Publishers which recently appeared before the Senate Patents Committee at Washington, to protest against the Dill Bill, which would allow the broadcasting of copyrighted compositions without payment of royalties.

Fritz Reiner and Willem Van Hoogstraten will share the honors of conducting the seventh summer season at the Lewisohn Stadium of New York. The entire personnel of the Philharmonic Orchestra has been engaged.

The La Scala Orchestra, under the direction of Pietro Mascagni, the famous composer of "Cavalleria Rusticana" and other operas, will go in July and August for a series of performances in Vienna. The programs will be given in the Arena, which accommodated eighty thousand people and has been remodeled into an open-air theater with twenty-five thousand seats.

Frank G. Dossert, teacher of singing, and composer, died at his apartment in Carnegie Hall, New York, April 6. His "Messe Solenelle" was performed at St. Peter's, Rome, by invitation of Pope Leo XIII. Among the pupils who have won distinction are Marguerite Sylva and Edward Johnson.

Harriet Danks, widow of H. P. Danks, composer of the music to Eben E. Rexford's tender poem, "Silver Threads Among the Gold," died in poverty in a Brooklyn rooming-house, on March 19. Contrary to the beautiful sentiment of the song, the composer and his wife separated soon after its composition, and he died alone in Philadelphia in 1903.

A National Conservatory of Music, provided in a bill introduced by Senator Fletcher, is in the hands of the Senate Committee on Education and Labor. At a hearing on March 25th, representatives from various musical interests and organizations appeared before the committee, to speak in favor of the bill. The Bacon Bill also is in Congress, which would create a commission to investigate and report within two years as to the feasibility of establishing a National Conservatory of Music.

A Harp 3,700 Years Old, one of the oldest of these instruments known to be in existence, has been discovered near the Euphrates and shipped to the Louvre of Paris where it will be on exhibition.

T. Leslie Carpenter, organist and choirmaster of Trinity Episcopal Church of Wilmington, Delaware, has finished his thirty-eighth year in that position, in recognition of which service the church has planned to send him for a summer vacation in Europe.

Bulletin of the Presser Home For Retired Music Teachers

At the regular meeting of the Home Social Club, on Thursday evening, April 17th, two piano solos and two vocal quartets, by members of the Home family, were a pleasing prelude to an interesting instructive "Talk on Two Railroads—Columbia, 1834, and Panama, 1855," by John C. Traubwine, noted engineer of Philadelphia, publisher of "The Engineer's Bible," and formerly head of The City Water Bureau. With absolute knowledge of his subject, and a ready wit, he presented graphically the rise and progress of the great railroad industry, holding his audience throughout to the keenest of attention.

Album of Favorite First Position Pieces
FOR VIOLIN AND PIANO
Price, $1.00
A volume of this kind is of great value in the violin world. It gives the beginner on the violin encouragement through the excellent numbers it contains which are melodious and interesting yet at the same time easy to play. There are twenty-two numbers of real worth arranged in progressive order. Teachers here have an ideal volume for instructive purposes and beginning violinists will find it just the volume to possess for their recreation or recital needs.
THEODORE PRESSER CO.,
1710-1712-1714 CHESTNUT ST.,
PHILADELPHIA, PA.

Advance of Publication Offers Withdrawn

For some months preceding this, there have been appearing under these "Publisher's Notes," *Advance of Publication* announcements of the works named below. In order to give music buyers an opportunity to become acquainted with these new works, orders were taken in advance of publication at specially low prices. These low prices are now withdrawn and delivery of copies made to those who ordered in advance of publication. Teachers interested in examining copies of these publications may secure them in accordance with our usual liberal examination privileges.

The works being withdrawn are:

M. L. Preston's Album of Compositions for the Pianoforte. This is a collection of successful pieces by M. L. Preston, who also has written under the name of M. Loeb-Evans. These numbers are chiefly in second and third grade and are suitable for teaching purposes or for pupils' recreation at the piano. Price, $1.00.

Program Pieces. (This work was offered in advance of publication as "A New Recital Album for the Piano.") In this new album, which is a new addition to our series of reasonably-priced albums made up of especially large plates, there has been assembled a collection of real gems, in grades three to five. There are a generous number of pieces, all interesting to study, and at the same time one enjoys listening to them. Price, 75 cents.

Songs for Girls. It is considered wise by many responsible for the molding of the characters of growing girls, as well as of young ladies in their "teens," to avoid the romantic, emotional and love texts in songs utilized for vocal instruction or entertainment purposes. This volume has been compiled carefully and none of the foregoing type of texts nor religious texts are used. The songs cover all aspects of nature (birds, trees, flowers, etc.); then some are humorous and there are some dialect numbers. All within the proper range for young voices. Price, $1.00.

Standard Vocal Repertoire. Contains about 40 fine songs, among which are included some fine sacred numbers, which makes this album one that will be serviceable to concert and church singers. These songs are writings of present-day composers and this album is one of the most reasonably-priced albums of copyrighted vocal material. Price, 75 cents.

Vocal Studies for Low Voice, selected, edited and arranged by George Whelpton. This is a book of material for systematic study work and it is an excellent contribution to modern voice teaching in that it furnishes specific material for those voices known as low voices. Mr. Whelpton's previous *Vocal Studies for Medium Voice* and *Vocal Studies for Soprano and Tenor,* are widely known and they present a sensible course of progressive exercises for the cultivating of the voice. The price of this new set of studies is 75 cents.

What the Vocal Student Should Know, by Nicholas Douty. Mr. Douty is one of the outstanding voice teachers of today, and is a musician of the first rank. Years of successful work as a concert and oratorio singer and as an artist teacher, qualify him to say with authority, "what the vocal student should know." There are some daily studies given in this book, in addition to the practical advice and instruction and it is a book everyone interested in the voice should read. Price, $1.00.

Changes of Address

Many of our friends will be leaving for their summer homes and will want THE ETUDE to follow them. When making your change of address for the summer, be sure to give us both the old and new, allowing about three weeks in advance of issue to insure copies going forward to the new address.

A Standard Brush for Our Premium Workers

Any of the following Fuller Brushes can be procured for a few new subscriptions. We don't have to say anything about Fuller Brushes, because they are too well known to require salesmanship on our part.

The Wonder Duster—Four new subscriptions.

Kitchen Set—Which includes pastry brush, bottle brush, percolator brush and gas range duster, all for 4 new subscriptions.

Fuller Wall Brush—Of soft imported hair with extension handle. Every wall including the ceiling, can easily be reached. Something you have always wanted—only 5 new subscriptions.

White Ivory Nail Brush—With attractive white ivory holder for the bathroom—4 new subscriptions.

Vanity Case—Of French ivory with small comb attached. A dainty, neat and compact adjunct to your toilette. A decidedly attractive case to carry—only 4 new subscriptions.

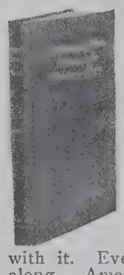
AN IMMENSELY POPULAR MUSICAL HISTORY—IDEAL FOR CLASS USE



Standard History of Music
A Text Book for Students of All Agents
By JAMES FRANCIS COOKE
Price, $1.50

A complete, concise, understandable, and authoritative series of lessons in the development of musical art, handsomely illustrated throughout. The work is so simple that any intelligent musical child of eight or ten should understand every word; so fascinating that older students are delighted with it. Everything is clearly explained as the work goes along. American music, modern music, and modern composers are adequately treated.

SUMMER CLASS REQUISITES
Excellent Text Books and Teaching Helps that are Ideal for Accomplishing Considerable in the Limited Time of a Summer Course.

Teachers may obtain any of these books for examination.
Catalogs covering any classification in music cheerfully sent upon request. Best discounts. Most liberal terms.

AN "IMMEDIATE SUCCESS" AND NOW THE MOST USED OF ALL HARMONY WORKS
HARMONY BOOK FOR BEGINNERS
Brief, Simple, Vital and Practical
By PRESTON WARE OREM
Price, $1.25

This book affords a thorough preparation for more advanced study by giving the main essentials of the subject, scales, intervals, common chords and the dominant seventh chord, in a simple, understandable and interesting manner. Rules, footnotes and cross references are dispensed with, everything being inserted in its logical place in the body of the text. Blank spaces are included, right in the book, for writing the exercises given.

Over a Million Pupils Have Studied With These Piano Methods

Beginner's Book
School of the Pianoforte, Vol. 1
By THEODORE PRESSER Pr., $1.00
Used more extensively than any elementary instructor. It takes the student, in a thoroughly delightful manner, through the first grade of piano study up to, but not including the scales.

Student's Book
School of the Pianoforte, Vol. 2
By THEODORE PRESSER Pr., $1.00
Takes up the subject where the *Beginner's Book* stops. In addition to the scales various phases of technic are exemplified in a manner that insures rapid progress.

Player's Book
School of the Pianoforte, Vol. 3
By THEODORE PRESSER Pr., $1.00
Presents pleasing study material arranged in progressive order, treating somewhat in detail, trills, octaves, two notes against three, the pedal and other matters necessary to technic.

Standard Graded Course of Studies
In Ten Grades *10 Volumes*
By W. S. B. MATTHEWS Pr., $1.00
This is the original, and in spite of imitators, still the one universally used course of piano study. It develops, when properly studied, technic of the best kind with a minimum of trouble.

For More Advanced Students

A SYSTEM OF HARMONY FOR TEACHER AND PUPIL
By JOHN A. BROEKHOVEN
Price, $1.00
This book has been used with much success in conservatory classes. It is a comprehensive work in which the subject is treated in a scholarly manner and contains splendid material for students who have mastered the elementary stages of theoretical instruction.

HARMONY
By H. A. CLARKE
Cloth Bound. Price, $1.25
A system of harmony, founded on key relationship, by means of which a thorough knowledge of the rules that govern the combinations and successions of sounds may be easily acquired. Different from other works on harmony in several important particulars, chief of which is the discarding of the figured bass, the pupil working from the melody, the natural way, from the beginning. The various subjects follow in logical sequence. Modulation is treated in a clear, easily comprehensible way.

SIGHT SINGING CLASS SUGGESTIONS

Graded Studies in Sight Singing
By GUSTAV VIEHL Price, 75c.
A complete, comprehensive and up-to-date sight singing method. While the course in this book is presented in a serious phase, it is by no means dull or uninteresting. The very start of sight singing, as well as the more intricate stages, are covered in this work. Sight singing is the basis of all musical education.

Methodical Sight Singing
By F. W. ROOT, Op. 21 Three Bks. 60c. ea.
Part 1—Methodical Sight Singing
Part 2—Through the Keys
Part 3—Progressive Musicianship
An excellent system, beneficial to students in singing or instrumental music, since it brings about a proficiency in musicianship, perfecting sight reading and giving an understanding of music that is as important as developing technic or vocal dexterity and artistry.

A New Work for Juvenile Classes
MUSICAL COMPOSITION FOR BEGINNERS
By ANNA HEUERMANN HAMILTON
Price, $1.00
The most noteworthy offering in recent years to the progressive teacher. From the simplest possible beginning it introduces the pupil to the fascination of "really truly composing," a previous knowledge of harmony being unnecessary. Nothing is better calculated to further the musical intelligence of pupils.

second month.

Yewell's Discovery

By Olga C. Moore

WHEN Mrs. Winnit decided that her son Yewell should study music, she engaged a good conscientious piano teacher. She knew that the beginning is where the best instruction is the most necessary. It is easier to learn a thing right the first time and keep it than it is to learn it wrong and have to undo it later on. There are so many bad habits into which we can fall; and a good teacher will always be on the lookout to correct these and suggest a better way. But the pupil must follow his teacher's advice and thereby improve his playing.

At the time of our story, Yewell Winnit had taken lessons for almost a year. He was an ambitious boy and hoped some day to be the leader of an orchestra. He realized, too, that he had to work hard, to get everything just right. So he read his notes correctly, tried to use the fingering as it was marked and counted out loud to be sure that he held each note its full value. He counted out all the rests, which was exactly as he should do, and he watched for the beginning and ending of slurs, to keep all the little phrases separated. In fact, he was quite particular about his work.

One day he practiced his hour, as usual, and then for a long time there was silence. His mother, failing to hear the piano any longer, began to wonder. She stepped into the room and found Yewell sitting on a low chair in front of the piano, with the bench for a table. He had pencil and paper in front of him and was examining a piece of music very critically.

"What is the matter, Son?" asked Mrs. Winnit. "Have you come to a hard problem in your work that you must solve it on paper?"

"Oh, Mother!" exclaimed the boy excitedly, "I didn't know till just now what a big thing music really is. How do you suppose the people who first started music ever thought of all this. Just look what I have found out! When I play only one note, there are ten different thoughts that have to go through my mind, all at once. First, there is the name of the staff, if it's treble or bass; second, the name of the note on the staff; third, which octave it is in, on the piano; fourth, if it is a sharp, flat or natural; fifth, if it is a white or black key; sixth, if it is a short note or if I hold it; seventh, what value the note has; eighth, on which count it comes; ninth, if that count receives an accent or not; tenth, and then what kind of a touch to use, with finger or wrist! Oh, Boy! to remember all that at one glance! Now I know why Mrs. M. always says, 'You must play slowly. You cannot play accurately and play fast.' No wonder she keeps stopping me because I do something wrong. I never thought about having so much knowledge going through my mind, for just one tiny note. I'll surely try harder to play slowly and *think* before I strike the key."

Mrs Winnit smiled knowingly, and said, "Yes, Son, you have made a wonderful discovery; and now you know why it takes so long to learn music. There are so many little things to watch. You realize, too, that slow playing is very necessary, to give you time to *think*. In that way you form correct habits. Those children who play fast cannot see and think accurately; therefore their music sounds slip-shod and of course is not music but noise. There is no reason at all why little people's music cannot sound just as musical as older folk's, if they will only try to learn to do the little things well. With good training, from little on, their music when they are grown, will sound so sure and good that every one will enjoy listening to them."

The boys out doors were calling, "Yewell Winnit, Yewell Winnit!" but to our ambitious little friend it sounded like, "You'll win it."

List of Musical Terms (No. 6)

COPY these terms in your note book. Most of them are Italian, and are frequently found in music.

Giusto—in strict time.

Glissando—a rapid scale effect produced by sliding the finger over the keys.

Grace-notes—a rapid embellishment of one or more notes preceding the principal note.

Grave—slow and serious.

Gusto or **con gusto**—with taste and elegance.

Grazia—gracefully.

Impromptu—a spontaneous composition.

Interlude—a passage coming between more important movements or sections of a composition.

Istesso—the same; as, *Istesso Tempo*, in the same time.

Interval—the difference in pitch between two tones.

DO NOT FORGET THAT THERE WILL BE NO "CONTESTS" DURING THE SUMMER. BE SURE TO NOTICE THE ANNOUNCEMENTS REGARDING THEM! TRY TO DO SOME EXTRA PRACTICING INSTEAD!

June

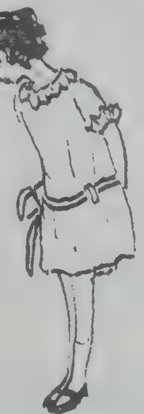
ARE you going to play at your teacher's Junior Recital this year? If you are not, it is surely because you did not do good work in your music; and you will always regret the lost opportunity.

But if you did good work and are going to play, you must do your very best and play better than you ever have done before. You owe it to your teacher; you owe it to yourself; you owe it to your parents; you owe it to your audience; and you even owe it to the composer whose music you play.

Did you ever consider what a great big debt that is, and at the same time how easy it is to pay that debt? Just play well!

And do have nice concert manners, too. Walk slowly and gracefully to the piano when your turn comes. After seating yourself, put your hands on the keyboard silently to see if your chair is just the right height, and if not, adjust it. Then pause a moment before you begin—it makes a much better effect, and gives you time to collect your thoughts.

And do not forget to bow. Even the very littlest girl should bow (boys, too). It is very rude to run away from the piano without acknowledging the applause of your friends, and of course you would not want to be rude!



Even the very littlest girl should bow.

I made a resolution once
To know my lessons well;
And that I've kept it ever since
My teacher's glad to tell.

Foreign Contest

THE closing date of the foreign contest was too early for the contestants living far away, so this contest will be reopened in the fall. Announcement will be made later, and the contributions already received will be held over. This contest was announced in the March JUNIOR ETUDE.

JUNIOR ETUDE—Continued

DEAR JUNIOR ETUDE:

One rainy day, as I was playing different notes on the piano which appealed to me, I repeated them several times and added more notes and chords. After a time I discovered I had composed a piece of my own. I named it "Rainy Day," as it was raining. I am taking THE ETUDE and would not give it up. I have not seen any letters from any of my little friends, but hope some will see mine.

From your friend,
MARION CARTER (Age 11),
Iowa.

DEAR JUNIOR ETUDE:

This is my first letter to THE ETUDE and I hope I will see it in print. I just love music, don't you? I am planning to be a music teacher when I grow up. I like THE ETUDE very much. I take all my old ones and stack them together, and then all my sheet music, then my song books and other music and put them in my music cabinet. This makes them look neat and they do not get torn up. Then when I want a certain piece of music I always know just where to find it.

I live in North Carolina and we have some beautiful rivers and flowers here. I wish I could send some of our flowers to the JUNIOR readers, but I can not!

From your friend,
VERA THOMAS (Age 14),
N. C.

DEAR JUNIOR ETUDE:

It seems to me that many teachers try wrong methods with young pupils. They tell them all about lines and spaces and black and white keys and get them all mixed up, and the teacher is not satisfied with the results.

If I were starting a pupil, I think I would say "Do you want to play a new game with me?" and I am sure the pupil would say "Yes, I love to play games."

We would call this game the "Forget-me-not-game." We would name all the boy companions of the pupil E, G, B, D, F (the names of the lines on the treble clef), and the girl companions we would call F, A, C, E. If he forgot the names of his companions he would have to pay a forfeit at his next lesson. For the bass clef the names of the boys and girls would be changed. I think this would bring good results at the first lesson.

From your friend,
RUTH SEGRIST (Age 14),
N. Y.

DEAR JUNIOR ETUDE:

I have been an interested reader of THE ETUDE for quite a while and have never seen any letters from Alberta. My town is going to enjoy the privilege of having the Provincial Musical Festival next month. Every one is very much interested and we all feel that it will add much to the appreciation of true music throughout our city.

Being too old to enter the JUNIOR ETUDE contests I am writing to the letter box. I feel that my sight reading has greatly improved since I have been studying from THE ETUDE musical pages.

From your friend,
AMY M. E. WICKS (Age 17),
Alberta, Can.

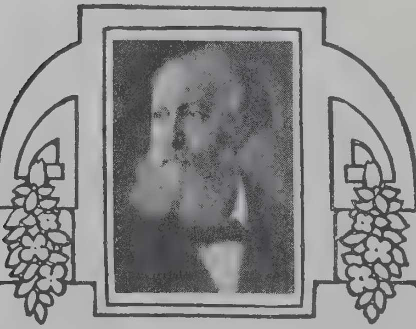
DEAR JUNIOR ETUDE:

I wrote to you once before and sent in a puzzle answer, but my letter was not printed and I did not receive any prize for my puzzle, so I thought I would try again; for "if at first you don't succeed, try, try again."

I live on a farm of one hundred and sixty acres, three miles from the nearest town and forty-five miles from the nearest city. Yesterday was the first time it has rained here for over four months. It has been quite a drought.

I have never seen any letters from my town, but I am sure everybody here enjoys THE ETUDE.

From your friend.
RACHEL DELHAUTE (Age 12),
Nebraska.



Charles-Francois Gounod

Born, Paris, 1818. *Died, Paris, 1893*

Composer of "Faust," the most popular of all French operas. His success rests first of all on the sensuous beauty of his melodies. Sometimes called "Master of the Triplet," as this figure prevails in so much of his work. His last year was given mostly to sacred composition.

Property of

Etude Portrait Series

? ? Question Box ? ?

DEAR JUNIOR ETUDE:

Is Rachmaninoff's *Prelude in C sharp minor* correctly named the "Bells of Moscow," and if so, is there a story connected with it?

J. K. (Age 16), N. J.

ANS. Rachmaninoff called this composition simply "Prelude" (in C sharp minor). As this composition became extremely popular, the name "Bells of Moscow" was given to it by some one to distinguish it from other preludes, and the name spread.

DEAR JUNIOR ETUDE:

I sometimes find in church music in the last measure there are two whole notes side by side. How is it counted and why is it written in this way?—B. P. F. (Age 12), Arizona.

Answer. In most hymn books the music is arranged for "part-singing" and frequently the alto and soprano, or the tenor and bass, close on the same tone. Therefore, the two whole notes are used, one for each voice, but they are sung at the same time and counted as one whole note. When a half or quarter note is thus used, it is only printed once, but has two stems, one going up for the higher voice, and the other turning down for the lower voice.

Rhythm in Walking

DID you ever notice yourself walk? you walk many miles a day, going to and from school and about your school building and your own home, going up stairs and down, and about your duties. Yet few people ever notice themselves walking.

Unless there is a physical defect, walking is in perfect rhythm except when going over uneven ground. Not only do your feet march along rhythmically, but also all the parts of your body are influenced by this rhythm, most noticeably your arms. The arms swing in rhythm with the feet. Have you any idea which arm is forward when the left foot is forward? Get up and walk around and investigate. Try to feel the rhythm of walking and swinging your arms. Then when you are practicing try to keep this same perfect rhythm. A *ritardando* is like going up hill and an *accelerando* is like going down hill, but all in good rhythm.

Letter Box

DEAR JUNIOR ETUDE:

I want to say that I appreciated an article in the JUNIOR ETUDE about scales. It said that scales were *not* hard to learn if one really tried. I believe that is right. Before I read it I hated scales and had always thought that I would never play four sharps or five flats. After reading the article I decided I could play the sharps and flats in scales as well as in pieces, if I really wanted to: and I did, and now I find them easy. In another of the JUNIOR ETUDES I read something about Schubert and so I looked him up, and am now learning his *Serenade.* I love the piano and spend a great deal of time at it, although I cannot take lessons at the present time.

From your friend,
MIRIAM BRIDGE (Age 11),
Okla.

Suppose we could not hear the sound
Of music any more!
Our ears, where all the sound comes in
Might choose to close their door.

But we could hear it mentally,
By thinking that we hear
The notes on paper, through our eyes
Sound in our "inner ear."

* * * * *

Half notes,
Whole notes,
Quarter notes,
Rest;
Count correctly,
Do your
Best.
Dotted notes,
Eighth notes,
Grace notes,
Trill;
Practice Carefully,
With a
Will.

Reprinted from Schirmer's Bulletin of New Music

AN OPEN LETTER

In conformance with the practice approved by the FEDERAL TRADE COMMISSION most of the music publishers of America recently decided henceforth to print on their music the actual retail selling price in preference to a higher list-price from which the buyer of music was expected to receive a discount.

In the opinion of the music dealers, too, this decision means a decided step forward in the mutual interest of public, dealer and publisher.

Though the former trade practice was well understood by the public and functioned reasonably well, occasionally it was abused and in order to remove such abuse, the music publishers took the action referred to above.

The same reasons prompted G. Schirmer, Inc. in the year 1918 to introduce a similar reform. The step was just as sound then as it is now, but apparently the time for it was not yet considered ripe by the business world at large and practical obstacles compelled us reluctantly to recede to the prevailing practice now abolished.

In the future all our music will leave our presses with the price printed on it at which we expect it actually to be sold to the general public. In other words, *new* stock will be sold to the general public and to teachers of music without a discount; our *old* stock will be shipped with an indication of the heretofore customary discount.

The revised system of listing prices of music is by no means absolutely new or revolutionary. The now abolished system was really a departure from the more desirable earlier American practice to "pay the printed price," a practice, by the way, which now prevails also in most countries of Europe.

We are confident that the public will immediately endorse this return to the previous American practice.

Hearing Things

By Helen L. Cramm

Little musician, when school is over and you fly away to the country or the sea shore, and have the long, sweet summer days in which to roam the fields and hills, or to enjoy yourself in the surf and sand with all thoughts of piano practice put aside, this is the time of times to learn to hear things. Our ears are very dull compared to those of the cat, the dog, the rabbit and the deer, and you will find nothing more interesting than trying to sharpen your ears to hear the music of nature.

When Mozart was a little boy he could tell in what key his canary sang; he knew the tone of the wind as it swept over the mountain pines; he could catch the note of the rushing river. Because he was born so very wise, musically, he was called "The little magician." Very few of us can distinguish the fine distinctions of which Mozart's ear was capable; but every one can hear much more than he does by learning to listen with *mind* and *ear*.

Before you start on your journey, suppose you begin at home and find the key of the distant whistle you hear every morning! Hum the tone it makes! Run to the piano and find the key which produces the same tone! Is it C,—or D,—or E flat? Be sure you have it right, and in the proper octave! When the big clock strikes get its key in the same way. When you hear the vacuum cleaner listen to the hum of the motor; mine sounds a perfect E flat, and when I hold it against the table leg it sings out loud and clear.

When you get to the country the first thing you will hear in the morning is the crowing roosters. Maybe the first one to greet the day will be a little Irish bantam who jerks out a short, soprano cock-a-doo-dle, possibly as high as c, and he will be answered by a tenor Shanghai who rolls out a lusty cock-a-doo-dle-doo somewhere around c. Listen to the cow bell, the pig squealing for his breakfast, the bleating lamb. Out in the field you will hear the bass of the bumblebee, the tenor of the honeybee, the high soprano of the mosquito as he sings around your head. Find in what key they sing and your ears will become sharper and sharper as you train them. You will come to know the key of the robin's morning song, and of the flute played by that sweet musician, the wood thrush.

Bye and bye you will hear more than one tone in many things; sometimes several tones which harmonize. Then as you sit by the brook listen for its song as it babbles along over the stones—you can hear it if you keep trying. As you come to hear the various voices of the wind and the waves, you will begin to know that all Nature is full of music, if we are but capable of hearing it.

The Beginner Who Rushes Along

By Larelda Kraus

To correct this habit, say to the pupil, "Imagine that my pencil is taking a walk on this music. Each measure is a block, the notes are children, and we leave four pennies in each block. Here we come to a block with only three pennies; so which do you suppose gets the extra penny? The cleanest one, the white note; and notice that it takes us just as long to walk this block as the one with more children in it."

"Life without reading would be meager indeed."—Sir Michael Sadler.

"The Angelus" has been used with immense success in the Hotel and W. G. R. Radio Recitals by Mr. Bouchard

THEO. PRESSER CO., 1710-1712 Chestnut Street, PHILADELPHIA, PA.

Etude Cover Design Contest

$250.00 Prize

THE ETUDE Herewith Announces a Prize Contest Open to All for Cover Designs Suitable for Our Publication.

REGULATIONS

1. The designs must have distinct musical significance with an appeal to as large a section of THE ETUDE'S widespread body of readers as possible.

   The design should be attractive from the News Stand (the selling standpoint), but must also make an effective cover for the music lover's home.

   Designs with a historical, educational or humorous trend will be considered with interest. Designs that are merely allegorical, purely idealistic with Grecian, Roman, or essentially antique grounds are not solicited. THE ETUDE is a practical paper for music-lovers, teachers and students of to-day.
2. Designs may be for two- or three-color reproduction.
3. Designs must be drawn in proportion to reduce to the standard size of THE ETUDE, 10½ inches wide by 13½ inches high.
4. The design must not bear wording or lettering.
5. Avoid the introduction of lyres, pan-pipes, lutes, antique instruments, banjo, guitar, etc. If an instrument is used employ the piano, organ or the instruments of the symphony orchestra.
6. Any contestant may submit as many designs as desired.
7. The ownership of the copyright of the winning design will rest with THE ETUDE.
8. All designs submitted must bear upon the back the full name and the address of the artist.
9. Postage to insure return must be sent with every design.
10. THE ETUDE assumes no responsibility for loss of or damage to any design, but every possible care will be taken of the designs while in our offices.
11. The contest will close Sept. 1st, 1924

Address all designs to

ETUDE COVER DESIGN CONTEST

1712 Chestnut Street, Philadelphia, Pa.

ETUDE friends everywhere are requested to notify their artist friends of this contest. Big names do not mean anything to us in comparison with effective, attractive, beautiful cover designs. Art Schools and Art Departments of Colleges everywhere are invited to co-operate with us in this contest.

How Shall I Address Them?

The days of the "manufactured" stage name has passed. Practically without exception we now know our favorite actress or singer by her real-to-goodness (usually maiden) name—with exceptions. The name under which fame is acquired becomes, as it were, a "trade-mark." After long and arduous years of toil to build traditions about a name, to drop that in favor of another would mean a loss of identity with their public; and so we still have, and always shall have public personages whose private names have changed—usually through marriage, as is the case with women.

May we introduce a few to you, giving the names by which we familiarly know them, followed by those used in the intimate home circle?

Professional	*In Private Life*
Dame Clara Butt	Mrs. Kennerly Rumford.
Amelita Galli-Curci	Mrs. Homer Samuels.
Guy d'Hardelot*	Mrs. W. T. Rhodes.
Mabel Garrison	Mrs. George Siemonn.
Katherine Goodson	Mrs. Arthur Hinton.
Maria Ivogun	Mrs. Karl Erb.
Marie Jertiza	Baroness Popper.
Josephine Lucchese	Mrs. (Capt.) Adolfo Caruso.
Dame Nellie Melba	Mrs. (Capt.) Charles Armstrong.
Elly Ney	Mrs. Willem van Hoogstraten.
Rosa Raisa	Mrs. Giacomo Rimini.
Cyrena van Gordon	Mrs. (Dr.) S. B. Munns.

*One of the few names surviving from the time real pseudonyms were popular as screens for hiding the identity of women entering a public profession.

"Avec Le Coeur"
(With the Heart)

By Geltrude Conte

It was in Palermo, Italy, where a violin graduate of that conservatory attended a concert given by Franz Von Vecsey. After the program she went up to him and asked if he would hear her play. Very kindly he gave her an appointment for the next day at Villa Igea where he was staying.

She went and played and Von Vecsey seemed very pleased for he had words of great praise for her and for her teacher. "But," he added, "you must play with your heart." "Avec le coeur," he really said, and laughed out boyishly.

I was very much surprised when I heard of this, for the young artist had lived in Sicily most of her life and like all Sicilians felt very keenly. It seemed to me that such advice might have been taken from and not given to her. However this phrase came repeatedly to my mind. Now, Americans say "Italians are emotional." I wonder if they mean it as a fault! But Vecsey says to a Sicilian, "You are cold, you must play with your heart!"

Some months later I had the opportunity of being coached by Maestro Carignani of Milan's Teatro della Scala. One day as we were working away at "La Boheme" and I was feeling unusually absorbed and exalted, the old gentleman suddenly stopped playing, turned around and shouted into my face, "Fire, fire!"

I had not even smelled smoke, but instinctively turned to look at the fire-place which naturally was vacant, it being the month of July.

It took me a moment to understand; and then I was surprised and a little discouraged. "Why, Maestro," I ventured, "I should think you might reproach me for overdoing this morning!"

"No, oh, no!" he answered; "you are so cold you actually give me the chills! Now remember these words!" And I have not forgotten them. "When you feel absolutely *ridiculous* with expression, then you are just beginning to put a little life in your music."

The Choir Master

Each Month Under This Heading We Shall Give a List of Anthems, Solos and Voluntaries Appropriate for Morning and Evening Services Throughout the Year.

Opposite "a" are anthems of moderate difficulty, opposite "b" those of a simple type.

Any of the works named may be had for examination. Our retail prices are always reasonable and the discounts the best obtainable.

1712 Chestnut Street, Philadelphia, Pa.

The World of Music

"Nerone," by Boito, had its premiere at the famous La Scala of Milan in the second week of May. The direction of this, the most colossal production ever attempted at La Scala, resulted in an ovation for Toscanini, the man behind the whole performance. The work is highly spectacular and some seats commanded as much as three hundred dollars each.

The Ohio Music Teachers' Association and the Ohio Federation of Music Clubs met in annual convention at Toledo, April 28-May 2. Prizes were awarded for compositions by Ohio composers and for competitions by young musical artists. Mrs. Edgar Stillman Kelley was elected president, and a movement to raise an Endowment Fund for the Federation was inaugurated.

The Women Composers of America have organized, with Mrs. H. H. A. Beach as chairman, and have become affiliated with the League of American Pen Women.

Charles O. Bassett, operatic tenor and the *Turiddu* in the first New York presentation of "Cavalleria Rusticana," died in New York on May 1. He first sang in America with the Mapleson company in 1884, with Patti, Nicolini, Scalchi and Nevada in the casts.

"Alglala," a New American Opera on an Indian theme, the libretto by Cecil Fanning and the music by Francesco de Leone, had its premiere at Akron, Ohio, on May 24th, with pronounced success. Mabel Garrison, Edward Johnson, Mr. Fanning and Francis Sadlier created the leading rôles. The event was quite of a civic nature, the Chamber of Commerce and other civic and social organizations sponsoring it, and had Mrs. F. A. Seiberling, past president of the National Federation of Musical Clubs, as a distinguished patroness.

The Philadelphia Band made its début on the evening of May 17th at the Academy of Music, as the concluding feature of Music Week. The band was organized by the Philadelphia Forum, with Leopold Stokowski as conductor, and it is to be a feature of important municipal occasions. From the color of the uniforms, it is colloquially known as "The Gold Band." The first concert was a pronounced success, and especially when it is considered that there was time for but four rehearsals. Its rhythm and tone color were splendid; while the more delicate passages were as lightly touched as if from strings. The familiar *Minuet* of Boccherini and the *William Tell Overture* were especially memorable. The popular climax of the evening came with the spirited playing of three Sousa marches, concluding with *The Stars and Stripes Forever* which brought the audience shouting to its feet.

Sir Walford Davies, who was offered the post of organist of St. George's Chapel, at Windsor, in succession to Sir Walter Parratt, has decided to decline the honors and to remain in his native Wales.

Lionel Monckton, well-known English composer, critic and barrister-at-law, died on February 15, at sixty-two years of age. Out of an estate of the gross value of three hundred and eighty thousand dollars he left five thousand dollars to the Royal Academy of Music to establish a prize to be awarded to the student of the school who shall show, during the year, the greatest proficiency in the composition of light music. Mr. Monckton wrote much of the music of the old Gaiety productions.

Wallingford Riegger has been awarded the $1,000 prize offered by Mrs. Coolidge for the best setting for four voices and small chamber orchestra of Keats' "La Belle Dame sans Merci." This is the first time a native American has won in these contests. Mr. Riegger was born in Albany, Georgia, and his work will be produced at the coming Berkshire Festival.

The Oldest American Organist, in point of service, has probably been found. Frederick C. Morgan, of Vermillion, Ohio, has been a church organist for sixty-two years; and Joshua Allen, of Walpole, Massachusetts, has been in similar work for fifty-eight years.

Puccini's New Opera "Turandot" is reported to be finished and in the hands of the publishers.

"Whipped Cream" ("Schlagobers"), a new ballet by Richard Strauss, had its first performance in Vienna on May eighth. The most effective and spectacular episode is when forty-eight dancers come out of a huge bowl of whipped cream beaten by a mechanical cook. The music is light, gay and typically Viennese, with an abundance of waltz themes.

The National Association of Harpists met for their fourth convention, in Indianapolis, May 10th. Eighty-five harpists from ten States and Canada were in attendance, with Carlos Salzedo as president and Edgar Stillman Kelley as an honored guest to conduct a scene from his "Pilgrim's Progress."

Opera in the Church Service is the latest in Nottingham, England. At the Unitarian Church, "Tannhäuser," "Lohengrin" and "Parsifal" have been given in concert form with comments by the preacher as to their religious significance.

Mascagani, Puccini and Toscanini have been named Senators by the King of Italy.

Albert Wolff, Musical Director of the Opéra Comique of Paris and favorably known in New York, is reported to be engaged to lead the musical forces of the Théâtre Champs Elysées owned by Mme. Ganna Walska (McCormick).

An American Opera Society of Chicago has been formed by merging the interests of the Opera in Our Language Foundation and the David Bispham Memorial Fund, Inc.

Oskar Merikanto, internationally known Finnish composer, died recently at the age of fifty-five. Aside from three operas he was the author of many piano, organ and vocal pieces.

The Pennsylvania Council, National Association of Organists, met at Allentown, May 29th. Among noteworthy contributors to the program were: Dr. Shelly, of Lafayette College; Dr. Harold Marks, Muhlenberg College; Prof. Edgar Shields, Lehigh University; Dr. Albert Rau, Moravian College; and Dr. John McE. Ward, President of the American Organ Players' Club.

Glen MacDonough, librettist of "Babes in Toyland," "It Happened in Nordland," and twenty-four other light operas for which Victor Herbert and other popular composers furnished the music, died at Stamford, Connecticut, March 29th. Despite his many successes it is reported that he died in want, cared for by a former collaborator and by the American Society of Composers, Authors and Publishers.

The Historic Covent Garden Opera House, of London, opened on the fifth of May for a twelve weeks' season under the same management as before the war. Wagner's complete "Nibelungen Ring" and Strauss' "Salome" filled the evenings of the first week, Bruno Walter and Carl Oscar Alwin conducting. King George and Queen Mary attended the first performance, for which orchestra seats sold as high as one hundred and fifty dollars.

The Wanamaker Band and Chorus, with Clarence Bawden at the Grand Organ, featured on Thursday evening of Philadelphia's Music Week, with a concert in the Court of Honor (seating fifteen thousand people) of the Wanamaker Store, in honor of Lieut. Comm. John Philip Sousa. Marie Sundelius was soloist of the evening, and in the second half of the program, which Lieut. Sousa conducted, sang his latest song, *A Serenade of Seville*, with such success that the audience interrupted with applause in the middle of the composition. The evening closed with Sousa's "The Last Crusade," a ballad for chorus, soli, orchestra and organ. In a short address Dr. Leopold Stokowski paid a glowing tribute to the art of Sousa, declaring that he has done something altogether distinctive in the field of music. Louis James Howell was baritone soloist. The conductor of the Wanamaker Band is Arthur Rasander.

Hugo Heermann, violinist, widely known German musician, recently celebrated his eightieth birthday, and is still actively practicing his profession.

Domenico Brescia, of San Francisco, has won the five hundred dollar prize offered by W. A. Clark, Jr., for the best Chamber Music Composition by a resident of California.

Mary Willing Megley recently conducted the Toledo Musical Festival. This is perhaps the first time a woman has wielded the baton over so large an event. The chorus numbered three hundred and fifty picked voices with an incidental chorus of thirty-five choir boys from Trinity Church, and was accompanied by an orchestra of fifty pieces. Edgar Stillman Kelley's "The Pilgrim's Progress" was the leading work presented.

Julius Stockhausen, formerly famous as an interpreter of the songs of Brahms, Schumann and Schubert, is to have the centenary of his birth celebrated by the Town Council of Frankfurt, who plan the publication of his "Life."

Stephan Krehl, theorist, composer, author of several books on harmony, composition and musical form, and professor of musical theory in the Leipsig Conservatory, died early in April at the age of sixty.

Coleridge-Taylor's "Hiawatha" had several presentations with scenery and costumes—as an opera—at the Royal Albert Hall of London. The Royal Choral Society, the Royal Albert Hall Orchestra and leading artists in the rôles, gave their services, as the enterprise was in the aid of the National Institute for the Blind.

The Cleveland (Ohio) Public Hall was dedicated on April 28th by a performance of "Aïda" by the Metropolitan Opera Company, with Moranzoni conducting and Ponselle, Claussen, Martinelli and Mardones in the cast. The Hall has been employed informally for some time.

Firmin Swinnen, eminent Belgian organist and composer, organist of Antwerp Cathedral, before coming to America several years ago, has been appointed private organist to T. S. du Pont at his magnificent home near Wilmington, Delaware.

Victor Herbert, with a world-wide reputation as one of America's most popular composers, died in New York, of heart failure, on May 26th. Born in Dublin, February 1, 1859 (of a German father and an Irish mother), at the age of seven he was taken to Germany where his musical talent was developed under the best masters. His first public work was as 'cellist, both as concert virtuoso and in the court orchestra of Stuttgart. He came to America as solo violoncellist of the Metropolitan Opera House Orchestra. In 1894 he succeeded the popular "Pat" Gilmore as bandmaster of the Twenty-Second Regiment of the New York National Guard. Later he founded the Pittsburgh Symphony Orchestra, and in 1904, the Victor Herbert New York Orchestra. He was a prolific composer of music of lightness and charm and yet of real worth. His one grand opera, "Natoma," was produced by the Chicago Grand Opera Company in the season of 1911. Of his fifteen or more lighter operas, "Cyrano de Bergerac," "Babes in Toyland," "The Serenade" and "It Happened in Nordland," are among the most widely known.

A $250,000 Guarantee Fund to make secure for three years the needs of the Kansas City Symphony Orchestra is assured.

A Cinema Bureau has been established in London for the purpose of properly training players for the moving picture houses. Candidates for positions in these houses are now accepted only after having passed an *audition* as to their experience and capabilities for this particular field of work.

The "Shanewis" of Charles Wakefield Cadman is to be presented in the Hollywood Bowl with Princess Tsianina in the title rôle and other parts taken by members of the Metropolitan Opera Company who appeared in its first production.

A National Lyric Theatre of Rome, to be constructed at once, will give the Eternal City an opera house on a par with those of Vienna, Paris, Berlin and New York. The stage is to be the largest in the world, while the auditorium will seat four thousand people. The exterior will suggest the old Roman theatre of Marcellus, and the classic spirit is to prevail throughout.

A Sculptural Memorial to Louis C. Elson, in the form of a bas relief portrait and inscription, is to be placed near the entrance to the recital Hall of the New England Conservatory of Music, where Mr. Elson was for many years an honored instructor.

Your musical friends will welcome your bringing it to their attention—See Page 494

THE ETUDE MUSIC MAGAZINE, PHILADELPHIA, PA.

COMBS CONSERVATORY

PHILADELPHIA

FORTIETH YEAR

A School of Individual Instruction — **A School of Public Performance**

Four Pupils' Recitals a week give you opportunity for Public Performance

All branches taught from the elementary to the highest artistic standard. Normal Training Course for Teachers. Degrees conferred. Daily reports keep the Director personally informed of your progress—Daily Supervision shows you how to work. Two complete Pupils' Symphony Orchestras offer exceptional privilege of orchestra routine and accompaniment. Reciprocal relations with University of Pennsylvania.

Courses for Public School Music Supervisors

Approved and Accredited Three-Year Courses in Public School Music Supervision. Pennsylvania Standard State Certificates issued upon completion of Course, without further examination.

Six Spacious Buildings — ***Dormitories for Women***

A School of Inspiration, Enthusiasm, Loyalty and Success

The Courtright System of Musical Kindergarten

Oldest and most practical system
A great opportunity for teachers to specialize in this unlimited field. Write for particulars of correspondence course.

Mrs. Lillian Courtright Card, 116 Edna Ave., Bridgeport, Conn.

DUNNING SYSTEM of Improved Music Study for Beginners

Endorsed by the Leading Musical Educators of the World

NORMAL CLASSES AS FOLLOWS:

MRS. CARRE LOUISE DUNNING, *Originator*, 8 West 40th St., New York City, August 1st, 1924.
Mrs. Zella E. Andrews, Leonard Bldg., Spokane, Wash.
Allie E. Barcus, 1006 College Ave., Ft. Worth, Texas. Summer Class—July 21—Rocky Mountain Artist Colony, Estes Park, Colorado.
Elizette Reed Barlow, 48 George St., New Bern, N. Car., New Bern, July 14th, 1924.
Mary E. Breckisen, 354 Irving St., Toledo, Ohio, Normal Class, July, 1924.
Mrs. Jean Warren Carrick, 160 E. 63th St., Portland, Oregon.
Dora A. Chase, Pouch Gallery, 345 Clinton Ave., Brooklyn, N. Y.; Carnegie Hall, New York, N. Y.
Luvenia Blailock Dickerson, 327 Herndon Ave., Shreveport, La.
Adda C. Eddy, 136 W. Sandusky Ave., Bellefontaine, Ohio, May 20th.
Mrs. Beatrice S. Eikel, Kidd-Key Cons., Sherman, Texas.
Miss Ida Gardner, 15 West 5th Street, Tulsa, Okla.
Cara Mathews Garrett, 1319 W. Lewis St., San Diego, Calif., June 30th.
Gladys Marsalis Glenn, Box 1188, Amarillo, Texas, Class—July 28, 1924.
Mrs. T. O. Glover, 1825 Gorman St., Waco, Texas.
Mrs. Travis Sedberry Grimland, 5839 Palo Pinto Ave., Dallas, Texas.
Ruby Frances Jahn, Dallas Academy of Music, Dallas, Texas.
Maud Ellen Littlefield, Dunning School of Music, 3309 Troost Ave., Kansas City, Mo., July 21st.
Carrie Munger Long. Normal Classes held in Chicago—July and August. For further information address 608 Fine Arts Bldg., Chicago, Ill.
Harriet Bacon MacDonald, 825 Orchestra Hall, Chicago, Ill. Classes Cleveland, Ohio, July; Chicago, Ill., August.
Mrs. Kate Dell Marden, 61 N. 16th St., Portland, Oregon.
Mrs. Wesley Porter Mason, 5011 Worth St., Dallas, Texas. Classes Dallas, July; Denver, Colo., August.
Virginia Ryan, 940 Park Ave., New York City.
Isobel M. Tone, 469 Grand View St., Los Angeles, Cal.
Mrs. S. L. Van Nort, 2815 Helena St., Houston, Texas.
Mrs. H. R. Watkins, 124 East 11th St., Oklahoma City, Okla.

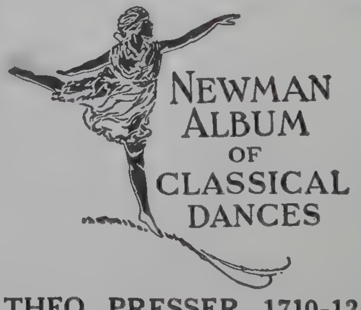
A Work of Great Value to Any Interested in Outdoor Entertainment



NEWMAN ALBUM OF CLASSICAL DANCES

A Volume of Fourteen Beautiful Dances, Fully Described, with Music for Each

Foot drawings and diagrams of all the figures, and illustrations of all the movements are given carefully.

The dances are arranged in the form of Solos, Group Dances and Ballets, making them particularly attractive for class work. The music is keyed with the description. The music is all of a high character, having been carefully selected from the writings of noted composers.

Cloth Bound, Stamped in Gold
Price, $2.50

THE ETUDE

JULY, 1924 Single Copies 25 Cents VOL. XLII, No. 7

Music Week Everywhere

Early in May some four hundred American cities and towns celebrated Music Week with a comprehensive scheme which brought music to everyone. Possibly one thousand towns celebrated Music Week in part. The editor's desk was snowed under with reports sent in by Etude friends, each very naturally proud of the accomplishments in that particular locality.

If we had attempted to reprint these reports in any manner to do justice to the subject they would have consumed two whole issues of The Etude. The Etude is a musical educational magazine and we do not attempt to give more than the facts of the outstanding musical events of the entire world. This is "covered" in our World of Music.

Probably nowhere in the country was the news of these wonderful Music Weeks received with more enthusiasm than in our offices. We wish that we might have published the notices of all; but since that is impossible we have to content ourselves with this mention and our congratulations to C. M. Tremaine, of the National Bureau for the Advancement of Music, through whose persistent efforts the Music Week movement has reached its present splendid dimensions.

The value of music week is enormous in making our citizens realize more and more what music means to the community.

Getting Down to the Truth About Jazz

Next month The Etude is going for Jazz. We will have both sides fairly represented. There is a world-wide interest in Jazz. It is an American creation. Many serious musicians have seen certain qualities in it that make them believe that it may have an influence upon American music. Will that influence be beneficent or disastrous?

Of course, Jazz has improved in the last ten years. There was a time when Jazz meant nothing but the stridulous noises made by spavined female morons over the footlights and the lacquered pates of the unregenerate gentlemen in the front rows of cheap theatres. Since then Jazz has been re-created by clever musicians until at the present moment millions and millions of Jazz records are in American homes.

We are convinced, however, that the habitual playing of Jazz is very dangerous to many piano students. Here is a letter which has just come from an Etude friend in Ohio, who desires help from the Teachers' Round Table Department. Thousands of teachers could relate similar instances.

"I would like to take up the study of piano again after two years of playing nothing but jazz. I find that my technical ability for playing 'classic' music has disappeared. Can you give me a series of exercises which will give me sufficient practice to enable me to continue my studies in one or two months?

"I had just finished Bach's two-part inventions, when I was forced to stop my lessons. Those I can still play because they are ingrained in my brain and always will be; but if I try to play scales and arpeggios in thirds, etc., with any degree of velocity, I discover my deficiencies. Also my touch has become hard and metallic!"

Here Comes the Band

What is it about a marching band that seems to send a galvanic current through every nerve and make us want to follow. A writer in the *Saturday Evening Post* tells how dogs seem instinctively to follow the band wagon in a circus parade. He says that he noticed for years how these stray animals would tag along after the music makers like the fabulous rats after the Pied Piper of Hamlin. Perhaps the myth of Orpheus and his lute (although the creator of the myth had a poor knowledge of the history of musical instruments) may not have been so impossible as the fable makes him appear. Unquestionably many animals do like music, and the human animal certainly has an inborn instinct to follow the band. Part of our boy-time fun with the circus parade was to get in line and march along.

A good marching band is better than all the tonics that come in bottles. It acts like a bracer. One unconsciously throws back one's shoulders and takes a deep breath and feels that it is fine to be living in a world of jubilant rhythm and joyous sounds.

Out of Focus

One of our readers in Western Canada writes: "The Etude has helped me in many problems by aiding me to get my focus." This was gratifying because we have long realized that people do not want to be preached to or preached at. They merely want problems explained in the simplest possible manner.

A great deal of the unhappiness of the world is due to the fact that so many of us are out of focus. When we understand things rightly the troubles disappear. It seems to be a human perversity to get wrong impressions, garbled ideas, and what the psychologists are now calling "complexes."

When we can see things as they really are, the "complexes" turn into smiles. We have known pianists who have persisted in employing ridiculous technical ideas, whose playing was as hard as concrete and whose whole attitude toward the art-loving public was that of severity. They have gotten their musical training from some musical policeman who has laid down the law to them; and, without even consulting their own brains as to the logic of these laws, they have followed them to the letter and cursed all those who failed to obey them with equal exactness. They are out of focus in the modern musical world. Their conception of humanity is bitter and severe whereas in art one's conception must be warm, tolerant, hopeful, buoyant.

We know of one musician of really great talent who, because he was out of focus, sulked for nearly three years. He was a fine fellow at heart but he thought that the world ought to come to his way of thinking and it never occurred to him that he might be wrong. There are pages after pages in Strauss, Elgar, Puccini and MacDowell that would have horrified the theorists of one hundred years ago. Their minds were so fixedly focussed upon what they understood was right that they could not have changed them.

Get in focus with the times. If things are not coming your way, don't blame things; try to understand the real problems clearly and GET IN FOCUS.

Maxims of a Muddled Musician

Order is music's first law. (*Apologies to Pope.*)

All things come to the musician who will only wait. (*Apologies to Longfellow.*)

The pean is mightier than the sword. (*Apologies to Bulwer Lytton.*)

The true medicine of the mind is good music. (*Apologies to Cicero.*)

The music teacher who praises everybody, praises nobody. (*Apologies to Johnson.*)

He who plays well is the best teacher. (*Apologies to Cervantes.*)

The price of musical wisdom is above rubies. (*Apologies to Job.*)

Facts About Music and Shakespeare

THE late Sir Frederick Bridge, C. V. O., M. A., Mus. Doc., formerly organist at Westminster Abbey, was an ardent student of the music of Shakespeare's day and just before his death published an excellent small work *Shakespeare Music in the Plays and Early Operas,* from which the following facts are taken.

"Music in Shakespeare's day was considered as important a branch of knowledge as Latin or Fencing."

"In Shakespeare's Day the man who did not know how to sing at sight was not considered well brought up."

"All the upper class houses in Elizabethan Days boasted of having a chest of viols."

"In Shakespeare's day the accompaniments to the songs were upon lutes and viols. The lute was a fretted instrument, picked after the manner of the guitar but with a pear shaped body like the mandolin and a long neck. It was in most instances larger than the guitar. It was said to cost as much to keep a good lute in condition as to keep a good horse. They were valued very highly, and in order that they might not be exposed to the weather they were kept in a bed between the rug and the blanket."

"In the early representations of Hamlet the soliloquies of the dismal Dane were often spoken to musical accompaniment."

How Schubert Found Inspiration From a Coffee Mill

By John Liesner

FRANZ LACHNER tells of a visit to Schubert when the composer, who was always obliged to live very moderately, was in despair over his inability to create new melodies.

"I have been writing all day but I have produced nothing. Do stay and let me make you a cup of coffee."

Lachner gladly assented and Schubert went to a battered cupboard and produced an antiquated coffee mill.

"This," he explained, "is one of my most precious possessions. There is something about the grinding of coffee that seems to set my mind working, and before I know it I have some really good melodies."

Lachner laughed at this; but after Schubert had carefully measured out his coffee by the spoonful he started to grind. In a few seconds he exclaimed, "I have it," and went immediately to the piano and played the themes of his famous *D minor String Quartet,* one of his most beautiful inspirations.

Meanwhile the precious coffee beans had fallen to the floor; and Lachner says that he nearly laughed himself to death clambering around the floor with the fat, bespectacled Schubert, picking up the beans.

How Queen Elizabeth Played the Virginals

A VERY quaint account of how England's most famous queen played the Virginals is given in a story told by the Ambassador sent by Mary Queen of Scots to the Court of England. The ambassador wrote:

"After dinner my lord of Hunsdean drew me up to a quiet gallery that I might hear some music (but he said that he durst not avow it), where I might hear the Queen play upon the virginals. After I had hearkened awhile, I took by the tapestry that hung before the door of the chamber, and seeing her back was toward the door, I entered within the chamber, and stood a pretty space hearing her play excellently well. But she left off immediately as soon as she turned about and saw me. She appeared to be surprised to see me, and came forward, seeming to strike me with her hand; alleging she used not to play before men, but when she was solitary, to shun melancholy. She asked how I came there. I answered, as I was walking with my lord of Hunsdean, as we passed by the chamber door, I heard such melody as ravished me, whereby I was drawn in ere I knew how; excusing my fault of homeliness, as being brought up in the court of France, where such freedom was allowed; declaring myself willing to endure what punishment her Majesty should be pleased to inflict upon me for so great an offense. Then she sat down low upon a cushion, and I on my knees beside her; but with her own hand she gave me a cushion to lay under my knee; which at first I refused, but she compelled me to take it. She then called for my Lady Strafford out of the next chamber; for the Queen was alone. She inquired whether my Queen or she played best. In that I found myself obliged to give her the praise."

Sparks From the Musical Anvil

Comments of Contemporary Music Workers

"SINGERS must be able to paint 'mind pictures' in tone, which is what counts in song interpretation."
—ARTHUR MIDDLETON.

"I PERSONALLY consider the modern British school one of the most vital in Europe. It is owing to the musicians, and especially the conductors, that these men have been given an increasing number of hearings."
—NIKOLAI SOKOLOFF.

"With the very complex music of to-day an interpreter is a very important factor. The composer creates a work. The interpreter re-creates it and breathes life into it and makes it a living, pulsating, vibrating thing."
—LEOPOLD STOKOWSKI.

"ART is the expression of the life and struggles of a people; hence, art is history. . . . If we are to be a part of international art, then our attitude must change at once. If Marshall has the voice of a Caruso, give him the same rank."—ELEANOR EVERETT FREER.

"MUSIC is an abstract art. It is possible for it to be both entertaining and uplifting; but quite frequently it is just the former. . . . There is need for entertainment; but I do contend that in music there should be more than entertainment."—LEOPOLD GODOWSKY.

"THE results of the war have been almost as disastrous as the struggle itself. It seems to have destroyed talent instead of creating it. But we can't be too pessimistic, after all. If we count up, there were many years between masterpieces of the past. They did not come one after the other."—FRITZ KREISLER.

"THE effect of the Radio upon concert business is problematical, and it is a subject which will not be decided definitely for some time to come. Personally, my experience is that it has aided grand opera by bringing the music to more persons than had formerly taken an interest in it. The Radio gives the music but leaves a want on the part of the listener to see the artists in person."
—FORTUNE GALLO.

The Value of Two-Finger Exercises

By Arthur Burton

EVERYBODY has heard the story of the old lady who had only two teeth and who thanked the Lord because they "hit."

The two-finger exercises are valuable on the pianoforte, first because of the opportunity they afford for concentration. Try this experiment: Play the first with the fifth and second fingers of the right hand; play C and D like a very slow trill with these fingers; then play C and E like a slow trill; then C and F; then C and G; then, if your hand permits it, do C and A.

Repeat these same exercises, but using the second and third fingers. Then do the same thing with the third and fourth fingers, endeavoring not to over-stretch the fingers. A little farther on the trills may be played faster. Always feel that the fingers are light and free, never hard and stiff.

Next do these same exercises with the left hand. Try to feel as though your hand and fore-arm were floating on air.

This training of two fingers will give you a kind of facility which you will find very difficult to acquire otherwise. Of course it is difficult for some students to see big things in small exercises.

Dr. Mason, be it remembered, based his first volume of "Touch and Technic" entirely upon the two-finger exercises and had Liszt's word for it that nothing would produce the same results as the two-finger exercises. It is well to remember the well-known lines of the poet Young. He said,

"Think naught a trifle, though it small appear, small sands the mountain, moments make the year, and trifles life."

Changes of Key

By S. M. C.

DESPITE the fact that pupils have been well drilled in key-signatures, major and minor, they are often unable to follow the modulations to related keys which frequently occur in the course of a piece or study.

Unless a piece is entirely chromatic, or belongs to the ultra-modern type which flouts the idea of tonality, the principal key will be well-defined and ordinary modulations should offer no difficulty to a pupil who has been taught the fundamentals of harmony and analysis.

A few hints on the use of accidentals for the purpose of modulation to related keys may be helpful to the pupil to whom changes of key are a stumbling block.

(a) If he finds that in a supposedly major key the fifth degree is repeatedly sharped, he may safely assume that the passage in question is in the relative minor. Here, for example, is a piece in D major. In the fourth and fifth measures A-sharp occurs repeatedly, harmonized by the F sharp major chord in the bass. A-sharp is the leading tone of B minor, and is foreign to the scale of D major; hence the student may conclude that the passage is in B minor. This, however, does not refer to chromatic passages, nor to mere passing tones.

(b) If in a composition with a signature of four flats the D is repeatedly marked natural, it is an unmistakable sign that the passage is in E flat. If in the key of C major F-sharp frequently occurs, harmonized by the dominant chord of D, it indicates a modulation to the key of G major. A B-flat, harmonized by the dominant seventh chord of C would indicate a modulation to the key of F major. It is well to note that sharp-four and flat-seven are the most common accidentals used in effecting modulations to nearly related keys.

(c) By related keys is meant the tonic, dominant, subdominant, and their relative minors. Thus, the keys closely related to C major are, F and G major, and A, E, and D minor. The leading tones to these keys are E, F-sharp, G-sharp, D-sharp, and C-sharp; hence four sharps might be found in the key of C as leading tones to related keys. As an exercise the pupil might write out the related keys of each tonic, as,

C major, F and G major, A, D, and E minor.
G major, C and D major, E A, and B minor.
D major, G and A major, B, E and F♯ minor.

(d) Sometimes modulations occur leading to remotely related keys, requiring the addition or cancellation of more than one flat or sharp. The only way out of the difficulty in this case is to know with absolute certainty the order of flats and sharps. The student will have to learn this order only one way if he will remember that the sharp series F C G D A E B, needs only to be reversed to get the flats. If he finds, for example, in a piece starting out in the key of C, a passage in which B-flat, E-flat, A-flat and D-flat occur, this passage is undoubtedly in the key of A-flat. If again he finds B-flat, E-flat, and F-sharp in another passage, either in the melody or accompaniment, he may safely assume a modulation into the key of G minor. The composer evidently finds it more convenient to add these accidentals where needed than to change the signature for every few measures.

The student who wishes to become proficient in recognizing changes of key should not neglect the study of harmony.

Unrest in Study

By George Henry Howard

ANOTHER factor in the makeup of pupils, unfavorable to the study of music, is the common spirit of unrest. A thing begun is likely to be unfinished. Students, as a rule, want to do what they may fancy at the moment. Satisfactory completion of required tasks is the exception. Steadfastness is largely a forgotten virtue. A purpose begun is not carried out. Studies are shirked at school and courses finished with the least possible effort. There are notable exceptions to this rule, but it is a rule, nevertheless. The students themselves are not wholly to blame for this condition.

The writing which is done in connection with musical studies is not, as a rule, the expression of something already conceived. Students work out their lessons in harmony or counterpoint as if they were problems in mathematics. Musical considerations are left out of the account; and, at the same time, the strictly intellectual work is lazily and superficially done.

Students should be led, from the first week of elementary instruction, into the habits of the scholar. They should be taught to think, in order to play. The teaching should lead to exact thinking, which produces good, accurate and artistic playing.

Let these Famous Pianists Help You to Help Yourself

A Self-Help, Eight Weeks' Intensive Summer Course in Pianoforte Study

With interpretations and printed lessons from many of the greatest teachers and pianists

At a Merely Nominal Cost

By L. D. WARNER

How the average student, obliged to study without a teacher, can make the summer count with no more expense than the purchase of the needed sheet music, books or records.

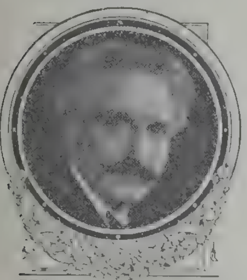
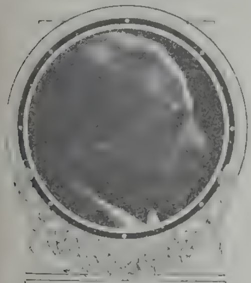
STOJOWSKI

GRAINGER



JONAS



DE PACHMANN

NOVAES

BAUER

HOFMANN

RACHMANINOFF

FRIEDMANN

SCHARWENKA

GOODSON

CORTOT

GODOWSKY

Thousands of ambitious, progressive music students will have the privilege of studying at summer schools and with private teachers during July and August.

Thousands of others will take various courses by correspondence and otherwise.

Still greater thousands will be inspired to study at home by themselves.

Nothing is ever quite as good as a fine teacher, if you can possibly secure one. If you have not this opportunity perhaps you have not realized that you can develop yourself at home by means of printed lessons and by listening to the actual playing of the world's greatest artists.

Let us suppose that by such means you learn to play in superior fashion just two or three pieces such as the Mendelssohn "Spinning Song," the Grieg "Bridal Procession," the Schubert-Liszt "Serenade," or the MacDowell "Witches Dance." It will prove well worth your while.

Let us suppose that you merely push your technic one or two points ahead. It will all count when you do get a good teacher. The main thing is not to waste your precious time complaining about your lack of advantages when you are simply surrounded with opportunities, if you will only make use of them.

The cost of the materials suggested in the following article is merely nominal. The master lessons cited may be bought at the price of ordinary sheet music. We assume that you have access to a good talking machine (possibly a fine player-piano). The records mentioned, which may be studied over and over again, cost only a mere fraction of what a lesson upon any one piece with the artist playing the record would be. There is no excuse for one not employing this plan, except lack of initiative or ambition.

[EDITOR'S NOTE:—*L. D. Warner is the nom de plume chosen by a teacher of experience who has had an opportunity to become well acquainted with the very latest materials in pianistic study and who for years has been in close association with many of the foremost living teachers and pianists. For reasons of his own he prefers to present this under an assumed name.*]

Many, many times in my experience I have had teachers and students come to me in the spring time and say: "I would give anything if I could make my work this summer raise me a peg or so higher in my career. I realize that there are fine Summer Schools that would help me in this direction; but my circumstances are such that if I study at all it must be at home and with very little expense."

Such students win the respect of the teacher; and I have always gone out of my way to advise them. Some teachers make the asinine mistake of thinking that their sum of knowledge is so precious that they should not let one particle of it go without the payment of a fee. I have always gone upon the principle that my profession is an obligation—that I would always have more pupils than I could possibly handle if I remembered this obligation. That is, I have always tried to help those who were trying to help themselves. In some instances, when their earning power increased, they came back to me and proved very profitable hard-working pupils whose work was a credit to them and to the work I had laid out for them.

Diagnosing the Pupil's Need

In general the pupil who wants to make an advance during the summer seems to be more in need of technic than anything else. Intensive work in technic is always feasible. One of the main things is to have a good plan. In order to have a plan you must know your own deficiencies.

Self-tests That Help

How much technic have you? How much control have you over speed, force, accuracy, rhythm, in playing chords, scales, arpeggios and octaves. Of course it would be unquestionably to your advantage if you could have an expert teacher examine you before taking up your eight weeks' course in intensive study.

If you can not have a preliminary examination or diagnosis made of your case by an expert, it remains for you to make such an examination yourself. The following tests may be valuable for you.

Test for Relaxation

Stand with both arms hanging at the side. With a sudden impulse toss the right arm upwards in front of you until it reaches the level of the shoulder, and then let it drop as though some one had shot the arm and it had lost all power. Now notice whether the arm swings at the side when you let it drop. If the hand does not dangle to and fro you are restraining the arm, you are not relaxing. Repeat this exercise not less than fifty times until the arm is thoroughly relaxed; then go to the keyboard and place your hand in playing position upon the keys. Analyze the feeling in your hand. Does it always feel free and unconstrained when you play? Repeat the same exercise with the left hand and test your relaxation at the keyboard. If your hand is perfectly relaxed, your wrist will sink below the level of the keys. That is, you would hold on to the keys with the tips of your fingers. This however is the extreme. In playing one relaxes but does not do so at all times to this extent. In your eight weeks' intensive course this exercise should be first every day. It will take you about five minutes to do this. At the end of the first week you will doubtless think that it is unnecessary and you will be inclined to drop it. *DON'T*. The more you advance the more you will need it.

Test for Hand Position and Tone

The writer assumes that you know the main principles of hand position as generally accepted. If you read the series of articles in the form of conferences with Josef Lhévinne, as they appeared in THE ETUDE some months ago, you were possibly impressed with the fact that in much modern piano playing the keys are not struck with the tip ends of the fingers but rather with the fleshy balls just behind the tips so that as much of the key surface is covered with flesh as possible. This does not by any means mean to play with straight fingers. It does mean that the key is to be struck with a soft pad and not a hard hammer.

Just to convince yourself try producing tone both ways, first with hard finger tip and then with the soft pad. After this practice in tone-making with each finger of both hands, devoting about five minutes to tonal experiments, say to yourself, "I am going to make the piano sound as beautifully as possible." Place one finger over the keys and then feel the impulse to play come from your shoulder, down the arm and by the slight elevation of the wrist depress the keys. Listen accurately, you will probably note a big difference between the tone you are able to get at first with the forefinger and that you are able to get with the fifth finger. Experiments in tone-making are never wasted; and if they are carried on daily, systematically, for eight weeks, you are sure to notice a big improvement in your playing.

Tests for Speed

Take the scale of B major, probably the easiest of all scales, because it seems to fit the fingers perfectly. Put the metronome at about fifty. Take the four-octave scale, playing (first hands separately) two notes to each beat. If you can play smoothly and easily at this speed, try four notes to each beat, then raise the metronome point by point until you find yourself making mistakes or stumbling. If you do not reach such a point go back and try eight notes to a beat, gradually advancing the metronome until you do find the inevitable errors. There is no reason why, with time and persistence, you should not play your scales at 1000 notes a minute, if you desire to do so. The method of doing this is fully explained in "Mastering the Scales and Arpeggios." Fleet fingers are invaluable in your technical advance. There is no better way in which to develop them than by means of scales and arpeggios. A half hour a day spent on scales makes a "wonderful showing in time."

A Test for Endurance

A great many students do not progress because they seem to reach a point beyond which they are not able to advance without hand strain or intense pain in the muscles of the forearm. This seems to show itself most in octaves. It is an easy matter to correct with time and patience. The writer once knew a pianist of some real ability who advertised himself as "the greatest octave player of all." He could play octaves marvelously, but was deficient in everything else. His arm muscles were enormously developed. He told the writer that he attributed as much of his strength at the keyboard to swinging Indian Clubs as to anything else. Endurance is a matter of muscular training. The great danger in acquiring it is in overdoing it. The muscles should never be strained. Practice up to the point where strain is noticeable and then stop.

Take out your watch and hold it in your left hand, repeating an octave with the right hand until pain in the forearm is noticeable. Of course you must play with loose wrist. Note the exact number of minutes which elapse before the signs of pain are felt. Now reverse the process, holding your watch in your right hand and playing with the left. You will probably find that the left hand tires long before the right. Write down the respective minutes and keep this as a weekly test during the eight weeks. There is nothing so encouraging as to note one's endurance or one's speed growing.

Devote about twenty minutes each day to pure octave study. The following works will be found desirable; but you should be very careful not to select studies beyond your grade of difficulty. Real damage may be done by overstrain in octave playing.

First Mazurka, Op. 21	Saint-Saëns
Second Gavotte	Sapellnikoff
Reverie Op. 34, No. 5	Schütt
Scherzo 2d Chorals, Op. 18	Dubois
The Troubadour, Op. 266, No. 4	Reinecke
Pattering Rain-drops, Op. 83, No. 1	W. G. Smith
Love Dreams, Op. 4	Al. Brown
Impromptu a la Hongroise	Lacome
Hungarian Dance, No. 7	Brahms-Philipp

Grade VI

Octaves and Chords: Gradus ad Parnassum, Book VI,	Philipp
Six Octave Studies, Opus 26	Preyer
Ten Brilliant Octave Studies, Opus 1044	Sartorio
Le Coucou	Daquin
Wedding Day	E. Grieg
Melody in F	Rubinstein-Schütt
The Cuckoo, Op. 34, No. 2	Arensky
Heartsease	Mrs. H. H. A. Beach
The Music Box, Op. 32	Liadoff
Danse Rustique, Op. 16	Mason
First Tarantelle, in A Flat	F. B. Mills
Polonaise in C	Hamer
Scene d'Enfant	Moussorgsky

Of course, the idea is to start with the required grade and do twenty minutes a day in octave practice until one may advance to another grade. The writer has known many self-help students who have made wonderful advances in octave playing, in the course of a few weeks, by regular daily practice. It is well to remember, however, that unless the student takes exercises to strengthen the upper arm and back muscles, the lower arm and fingers may not be able to stand the strain of modern technic. Any good calisthenics for this purpose are beneficial. We know of one Russian pianist who was accustomed to standing about one foot from a wall, placing the palms of his hands upon the wall, and then letting his body tilt forward so that the weight of the body rested upon the hands. Then he pushed back the body with the arm muscles and repeated the exercise until tired. The octave playing of this pianist is famous.

General Outlines of the Plan of Intensive Study

The main thing, after all, is to have a plan, and a good plan. Work for a definite object and keep yourself up to the mark. Of course, it is impossible to make a cut-and-dried plan that will fit all grades. This is something that the reader must determine for himself. It may very easily be selected by means of the lists of graded studies printed in "The Guide to New Teachers," which the publisher of The Etude has sent entirely complimentary to thousands of self-help students. From such a book select the needed materials for your grade and employ them as follows:

The First Daily Practice Period

Relaxation Exercises	(as suggested)	about	5	minutes
Tone-making Exercises	"	"	5	"
Scales	"	"	10	"
Arpeggios	"	"	10	"
Octaves	"	"	10	"

The Second Daily Practice Period

This should consist of studies. These should be carefully selected by the student after a searching self-analysis of his technical needs. There are studies by standard composers, for almost every purpose, in the list we have mentioned. If you do not feel confident that you can select the studies you need, it might be safer to take a list of studies selected by experts, such as those found in the "Standard Graded Course" in ten grades.

About forty minutes a day should be devoted to the practice of studies.

Third Daily Practice Period

From one to two hours should be devoted to this period. We would advise the student to have at least three pieces under way all the time—one classic, one romantic, one drawing-room piece. Let us suppose that the student is in the Fifth Grade. He might have a choice of the following:

Classics

Beethoven	*Moonlight Sonata* (slow movement)
Mozart	*Fantasia in D Minor*
Haydn	*Sonata, No. 14*

Romantic

Rubinstein	*Romance, Op. 44, No. 1*
Borowski	*Nocturne*
R. Strauss	*Träumerei*

Salon Pieces

Lack	*Song of the Brook*
Wachs	*Shower of Stars*
Mason	*Spring Dawn*

In addition to these pieces, if the player's ability permits, the writer would strongly urge the student to take up the study of some piece in his grade upon which a well-known pianist has written a special lesson. By following out the written directions, these lessons in print are invaluable. In some cases excellent phonograph records, by great pianists, also are obtainable. For instance, the writer knows that Percy Grainger has made a very fine record of Grieg's *Norwegian Bridal Procession*, for which he has also written an excellent analytical lesson. By the combination of the two the self-help student can secure for less than two dollars what comes as near as is possible to a lesson in person with Mr. Grainger, and at a fraction of the cost.

Here is a list of excellent lessons in print which may be obtained from your publisher literally at the cost of ordinary sheet music. These are published in an edition known as "Master Lessons," the printed lesson of two pages of text accompanying the carefully edited piece:

Schubert-Liszt. ***Serenade.*** **Grade 7.**
ANALYTICAL PRINTED LESSON EDITION BY KATHARINE GOODSON
Duo-Art Record by Harold Bauer.
Ampico Record by Howard Brockway.

Mendelssohn. ***Spinning Song.*** **Grades 5-6.**
ANALYTICAL PRINTED LESSON EDITION BY S. STOJOWSKI.
Brunswick Record by Elly Ney.
Columbia Record by Josef Hofmann.
Victor Record by Rachmaninoff.
Edison Record by Andre Benoist.

Chopin. ***Polonaise, Op. 26, No. 1.*** **Grades 6-7.**
ANALYTICAL PRINTED LESSON EDITION BY ALBERTO JONAS.
Duo-Art Record by Harold Bauer.
Ampico Record by Felix Fox.

Mendelssohn. ***Scherzo, Op. 16.*** **Grade 5.**
ANALYTICAL PRINTED LESSON EDITION BY EDWIN HUGHES.
Victor Record by Cherkassy.
Duo-Art Record by Renard.
Ampico Record by Josef Hofmann.

Chopin. ***Valse in C Sharp Minor.*** **Grade 6.**
ANALYTICAL PRINTED LESSON EDITION BY EDWIN HUGHES.
Brunswick Record by Josef Hofmann.
Victor Record by Paderewski.
Duo-Art Record by Joseph Hofmann.
Ampico Record by Borchard, by Godowsky, and by Ornstein.

Grieg. ***Bridal Procession.*** **Grade 5.**
ANALYTICAL PRINTED LESSON EDITION BY PERCY GRAINGER.
Columbia Record by Percy Grainger.
Duo-Art Record by Ganz.

MacDowell. ***Witches' Dance.*** **Grades 6-7.**
ANALYTICAL PRINTED LESSON EDITION BY MRS. EDWARD MACDOWELL.
Brunswick Record by Godowsky.
Duo-Art Record by John Powell.
Ampico Record by Hans Hanke.

Schumann. ***Träumerei.*** **Grade 4.**
ANALYTICAL PRINTED LESSON EDITION BY CLAYTON JOHNS.
Duo-Art Record by Godowsky.
Ampico Record by M. Volavy.

Rubinstein. ***Barcarolle, Op. 30, No. 1.*** **Grade 5.**
ANALYTICAL PRINTED LESSON BY STOJOWSKI.

Schubert. ***Moment Musical, Op. 94, No. 3.*** **Grade 5.**
ANALYTICAL PRINTED LESSON BY S. STOJOWSKI.
Brunswick Record by Elly Ney.

Schumann. ***Nachtstück, Opus 23.*** **Grade 6.**
ANALYTICAL PRINTED LESSON BY S. STOJOWSKI.
Duo-Art Record by Novaes.
Ampico Record by Godowsky.

Mendelssohn. ***Rondo Capriccioso.*** **Grades 6-7**
ANALYTICAL PRINTED LESSON BY KATHARINE GOODSON.
Columbia Phonograph Record by Josef Hofmann (A6078); by Xaver Scharwenka (A5467).
Victor Record by Cortot.
Duo-Art Record by Josef Hofmann.
Ampico Record by C. Adler.

Schubert-Liszt. ***Hark! Hark! the Lark!*** **Grade 7.**
ANALYTICAL PRINTED LESSON BY S. STOJOWSKI.
Columbia Record by Ignaz Friedmann.
Duo-Art Record by Paderewski.
Ampico Records by Volavy and by Moisewitsch.

Mozart. ***Fantasia in D Minor.*** **Grades 5-6.**
ANALYTICAL PRINTED LESSON EDITION BY JOHN ORTH.
Duo-Art Record by Raab.
Ampico Record by Herbert Hyde.

Chopin. ***Impromptu, Op. 29.*** **Grade 7.**
ANALYTICAL PRINTED LESSON EDITION BY S. STOJOWSKI.
Brunswick Record by Godowsky.
Victor Record by de Pachmann.
Duo-Art Record by Friedmann.

If the student has time for collateral study, we would advise very strongly the following works: "Principles of Expression in Pianoforte Playing," by Christiani; "Expression," by M. Lussy; "The Standard History of Music," by Cooke; "Music Masters, Old and New" or "Great Pianists on Piano Playing," by the same author; "Improvisation," by Sawyer, and "The Beginner's Harmony," by P. W. Orem.

A Grand Piano Gives a Lesson

By R. L. F. Barnett

A certain pianist who prided himself on the firmness of his touch was trying different grand pianos when his attention was called to a rebuilt instrument of a very fine make. The pianist was much pleased with the tone, but happened to look inside at the action just as he had struck a chord with both hands.

"This piano," he said, "shows signs of wear;" and indeed it seemed so, for the hammers he was using stood at very unequal distances from the strings.

"That is strange," replied the salesman, who was an amateur pianist; and he in turn struck a chord. All the hammers in use stood exactly on a level.

The pianist investigated and soon found that in chord-playing his fingers did not go down with equal firmness.

It is easy to forget that chords are made up of single notes, each of which must be held with a firm finger-tip. If you find it hard to play a certain chord firmly, try playing the notes separately, then two at a time, with the hand always in the position it must take to play the chord. You will soon find out which fingers are shirking and the process will certainly result in a noticeable improvement in your chord-playing. Do not allow yourself to think that there is no technical work for you in a piece that is made up mostly of chords.

Don't Interrupt Pupils

By Joseph George Jacobson

When a pupil plays a piece to you at the lesson do not interrupt at first to correct minor mistakes. Let the composition first be played through as a whole, then go over it again, making corrections. Try to select pieces a little easier than the etudes and exercises. If a piece is well played Mamma will be well pleased, and it will be a feather in your cap. Train the memory from the start. Show them how to memorize by taking two measures at a time and committing to memory first one hand, then the other, then both; and continue in this manner through the entire composition. When a piece becomes dull to the pupil, take it away for a while. A pupil left his teacher recently because she made him study a piece for a whole year.

Pupils want melodious pieces, and the teacher must know what style of compositions please them. Try to explain the composition in some manner of interest; draw on your imagination, even if you do not know what the composer "thought" of when this piece was being created. Most likely he thought of just the piece. Compositions are crystallized results of many thoughts fused in the flame of emotion. Of course, you do not want to say that to the young pupil.

Why She Quit

By S. M. C.

A tiny black-eyed Italian girl came for lessons.

"My mamma says I want to take music lessons."

"How old are you, and what is your name?"

"I'm six years old, and my name is Rosalie Lombardino. I used to take lessons from another teacher; but my mamma quit me."

"Why did she quit you?"

"The teacher didn't learn me anything. Every time it was C-D, C-D, and I had to pay twenty cents, and she never put me in any higher grade, so my mamma just got tired and quit me."

A Spring Day, a Pitch-Pipe and Some Ear-Training

By Grace May Stutsman

One of the largest contributing factors in sight reading is the power to mentally translate the visible into the oral. Conversely, the faculty for translating the oral into the visible is also imperative. If these faculties are undeveloped, memorizing and sight reading become a difficult process even to the accomplished musician. Few children (or grown-ups, for that matter,) have a "golden" ear, which makes it necessary to develop the hearing as systematically and as thoroughly as possible, to which end we recommend the use of a good pitch-pipe.

As the days lengthen and warm weather approaches, the out-of-doors possesses a great appeal. If the teacher is a nature enthusiast it is entirely possible to hold the ear-training class on the bank of a stream or in the cool recesses of a wood. A child is always on the alert for the unusual; and the novelty of a music lesson in the open makes an instant appeal to his imagination.

A bird song may not seem to him to have tonality, but if tested out with a pipe, softly, it is shown to have pitch as well as form. A cricket's chirp, the distant honk of an automobile horn, each has a key which may be definitely determined on the spot.

Notation pads should be taken along so that dictation can be taken, if the pupils are advanced enough to have reached that stage. Each child should take his turn at giving as well as taking dictation. The teacher, for obvious reasons, must also take it down.

When the child gives dictation, do not start him out with a note from the pipe. Make him decide the tone upon which he hopes to commence and rely on his own sense of pitch to begin. The tonality can be unobtrusively verified during the progress of the exercise being given, and at the end, a discussion will be in order relative to the key established.

Countless other uses to which the pitch-pipe may be put, will suggest themselves to the ingenious teacher. These are mere suggestions, intended to stimulate the imagination of the one who resents being housed when the first balmy days appear.

How "Little Italy" Requires Its Funeral Marches

By Dr. H. P. Hurlong

In "Little Italy," that most interesting quarter of Philadelphia, music plays an important part in the everyday life and habits of its people. Its use for wedding celebrations, house parties and infant christenings may not be a very great departure from general customs; but its connection with funeral processions is both curious and strange.

This touch of the Old World, to which many cling so tenaciously, may be observed almost any day of the year in the vicinity of the churches in this section. The weeping relatives and friends mournfully marching with bared heads bowed down; the band of brasses, reeds, and muted drums, playing tunes which seem to portray the sorrows and agonies of the bereaved; is most unusual and impressive.

Of peculiar interest is the fact that the character and kind of music played denotes the relative age and importance of the deceased to the community. Martial airs and bright rhythms indicate the procession in honor of an infant whose soul is presumed to enter directly into Heaven. Here the music is in no sense funereal. In fact there is an air of religious joyousness about it which is truly surprising,

The dull, rhythmic beat of a muted drum, the continual roll of the snare, the snatches of minor chord and melody, create an atmosphere of sorrow, which is relieved by the introduction of occasional major chords, subtly suggesting resignation. This indicates that a person of age has passed away whose demise is timely. The heart-rending minor mood, carried to the point of despair, is used for the youth cut off in his prime or for the maid, whose deep, dark eyes will no longer kindle the fire of passion in the heart of her lover.

Sometimes the Chopin *Funeral March* is played; but more often, and more impressive, the composition used is traditional and of such antiquity that its composer is either unknown or forgotten. In this latter case the melody is carried in the clarinet and the clarinetist so uses his instrument as to produce a tone almost akin to a human cry of despair.

"Pigeon-Toed Hands and Fingers With Arched Insteps"

By C. M. B.

There is nothing more interesting than to be entrusted with a piano beginner under six years of age—say from three to five! Do you say that is too young to start? Perhaps it is, under ordinary circumstances, but with daily fifteen-minute lessons, no practice alone, very gradual requirements as to progress, and a carefully varied training in technic, ear-training, and appreciation, the little one can be conducted pleasantly and safely through his introduction to the piano by the time he is six or seven.

The advantages of so early a beginning? Observation and experience lead to the belief that the child who "does not remember when he did not know his notes," or when he first placed fumbling, helpless fingers on the keys, develops an ease and sureness of touch beyond that of later beginners—other things being equal. Moreover, it solves the question, "Shall he take music?" He is past the point of making it a matter of daily dispute by the time he is old enough to debate it. Though he may later discontinue music, because of greater inclination and talent in other directions, he will not run the risk of missing a musical training because the difficulties seem so enormous and the time required so appalling, as they often do to older children.

But all this is prefatory to a note on method which rises out of experience with young pupils. Whether we begin with the five-year-old or the ten-year-old, we find two conditions of the hand which call for constant education. One is the outward, downward slope which throws the fourth and fifth fingers to the outer edge of the keys and weakens their stroke. Another is the collapse of the nail-joint upon striking a key, which, if allowed to continue, results in a straight, stiff finger from the first joint to the end. This last fault may be guarded against to some extent by requiring only very soft tones until the stroke can be made without collapse. But even so, these two tendencies demand the teacher's earnest attention during the first months of instruction. A beginning must be made toward slanting the hand inward, this to be continued through all subsequent training; and the convexity of the third finger-joint must be established in early lessons, or it can hardly be secured afterwards.

All this means countless reminders! Now to say "Extend and raise the outer side of the hand!" or "Do not let the nail-joint of the fingers sink in!" takes time, and to say it a good many times during a lesson is wearing. So when explaining these points to a little pupil, and showing him a good hand and finger position, I say, "You see, the hands really go pigeon-toed, don't they? And the fingers, instead of stepping flat-footed, have nice arched insteps, like good dancers!" And when, a little later, during the ordeal of managing notes, time, fingering and expression, the child lets the hand fall into the awkward, feeble, outward slant, and the fingers break down, I say softly, "Pigeon-toed hands, and arched fingers!" and he recovers position—knowing well that a halt will be called unless he does so.

An instructor in a noted military school stated that the correction of a boy's carriage and posture was practically secured in the first few months of his training. "We do not relax our attention for a minute," he explained, "nor permit any relapse into wrong posture until right habits are formed." After all, this is the shortest, easiest way in all such problems. It is a saving of time and effort in the long run to protect the little pupil against bad habits from the very beginning, and to leave him free to progress, unhampered by faults into which he never should have been allowed to fall.

A Musical Dialogue

By Laura Roundtree Smith

(An Entertainment for Use at Musical Club Meeting.)

The names of the Musical Compositions are written on cards. They are numbered, and on the back of each card is written a short paragraph, which the one holding the card may read.

The names used are Prelude, Invention Etude, etc.

Number One: I am little Prelude, a short selection.

I am used really to prepare the ear for what follows.

How often the great composers improvised a little Prelude. None, I am sure, can be more beautiful than the Preludes of Chopin.

He loved to compose Preludes while alone on the Island of Majorca.

He imitated the sighing of the winds.

He imitated the patter of the rain-drops on the roof.

(Plays any Chopin Prelude.)

Number Two: I am sitting up as stiff as can be, for I am an Invention, written by Bach, of course.

Everyone will expect me to act in a most dignified manner.

Allow me a few trills and turns, if you please!

I am hard to play, but no music student will ever escape me.

Perhaps the Invention will sound more interesting to you if you will close your eyes and imagine the little Bach copying my notes in the moonlight.

(Plays any Bach Invention.)

Number Three: I am an old-fashioned Etude.

I suspect I belong to Czerny or Heller, I am not quite sure which.

I shall hurry now and play for you.

What is that? You say the Etude is not so old-fashioned after all.

You say McDowell also wrote Etudes?

Very well, I feel it, though, in my bones that I am rather old-fashioned.

(Plays Czerny or Heller Etude.)

Number Four: I am a Barcarolle. My name brings up a scene in Venice. The lightly gliding gondola and the boatmen's song. I will introduce the Serenade if you will listen to me.

(Plays Barcarolle and Serenade "Tales of Hoffmann.")

Number Five: You called for a Rondo? Yes, here I am.

Beethoven was fond of me, and I feel proud of that fact.

You say I repeat myself? Why, of course I do. I grow attached to one theme and repeat it over and over. I like to repeat myself also in contrast to another theme.

I love to think how smoothly I came from under the fingers of the great Beethoven.

He could make me laugh when he was in a happy mood.

(Plays any Beethoven Rondo.)

Number Six: I am a Largo. I move very slowly. I feel as though I had the weight of the Nation on my shoulders.

I am solemn, and why should I not be? I am so very, very old.

I think often of little Handel stealing up alone into that dark old garret to play.

To-day his melodies have become eternal.

(Handel's Largo, violin and piano.)

Number Seven: I am a Symphony, a very grand composition, indeed, when written for the whole orchestra. I have four movements, so I can furnish you with some variety.

Oh, dear, I hope the fiddles are in tune, and I hope that drum knows when to come in.

As Papa Haydn introduced me, I will play the Andante from his Surprise Symphony.

Number One: I know the story of the Surprise Symphony!

Number Five: Hush! it is not your turn; be still and listen!

Number Seven plays Andante from Surprise Symphony, Haydn, (arranged by Saint-Saens).

Number Eight: I am an Impromptu; I do not belong to the public. I am only a little piece for the Composer himself, dashed off without a moment's notice.

I am popular with some people to-day.

Schubert may have composed me in a beer-garden.

(Plays any Impromptu of Schubert.)

Number Nine: I do not know if I really belong in this company or not. I am one of the Songs Without Words.

Surely, I cannot be the "Spring Song"; that composition is worn threadbare by repetition.

I am often played so badly that the song is lost.

I like that picture that we had of Venice, and I can do no better than to play one of Mendelssohn's Gondola songs.

(Plays Gondola Song, Mendelssohn.)

Number Ten: I am a little Romance. I am so bashful. I would like to be excused from appearing.

I belong really to moonlight nights, and old-fashioned gardens,

(All: He is going to play the Moonlight Sonata.)

Number Ten (continues): No, no, I will not play a Sonata.

I heard one student say yesterday she memorized me just because I was short! The very idea! I would be ashamed to say such a thing.

I belong to Schumann, and he wrote me one day when he was very, very sad.

(Plays Schumann's Romance, Opus 26. No. 2.)

Number Eight: That was shocking to memorize so beautiful a piece just because it was short. It makes me think of the old lady who said. "Play me any 'Opus,' please! I love to hear an 'Opus!'"

Number One: What did the old lady mean?

Number Two: Hush! Don't display your ignorance. Look up the meaning of Opus in the Musical Dictionary!

Number Two: I am little Berceuse, a lullaby. Nothing could be more fitting than to complete the program with a lullaby, Unless someone arrives late, this will finish the program.

(Plays Berceuse from "Jocelyn," Godard. violin and piano.)

Number Twelve: I am called the Minuet. I am late, I know, but my street-car was delayed.

Number Thirteen: How very odd, I am called the Minuet, too, and I am also late, for my auto broke down.

Number Ten: Who ever heard of that old-fashioned dance, the Minuet, being given without a partner? We are glad to welcome you here.

Numbers Twelve and Thirteen (in concert): Many great musicians wrote minuets, but since we arrived together we will play together.

We will play from a Minuet by Mozart.

We will play a duet.

(Play Minuet from Symphony in E Flat, Mozart, "Concert Duets.")

(All shake hands and pass out.)

Haydn's Gay Heart

JOSEPH HAYDN, the serene and pious composer, explained the serenity of his Church compositions, so severely criticised, with the following golden words. "I do not know how to do differently. I give what I have, but when I think of God my heart is so full of joy that the notes flow from me like thread from a bobbin; and as the Almighty has blessed me with a gay heart I feel certain that He will forgive me if I serve Him gayly."

Tchaikowski's Strange Marriage

WHEN Tchaikowski was thirty-seven he married against his will. He gives the following (abridged) explanation of the curious episode in a letter to Frau von Meck:

"One day I received a letter from a girl I had known for some time. I learned from it that she loved me. The letter was couched in such warm terms that I decided to answer it. . . . The result of the letter was that I followed the wish of my future wife and called to see her. . . . By the following letter I saw that I had gone too far; that if I now turned from her suddenly it would make her unhappy and possibly drive her to a tragic fate.

"So the weighty alternative opposed itself: Either I got my liberty at the cost of a life, or I married. The latter was my only possible choice. So one evening I went to see her, declared openly that I could not love her, but that I would always be her grateful friend; I described minutely my character, the irritability, the unevenness of my temperament, my diffidence—finally my financial condition. Then I asked her if she would be my wife. Naturally her answer was 'yes.'"

In less than a month from the honeymoon Tchaikowski tried to kill himself by standing up to his chin in the ice-cold river! After six weeks of it he ran away and never saw his wife again, though he provided for her financially.

"Indecent" Music

By W. F. Gates

A CONTEMPORARY speaks of "indecent" music. Of course, this expression may have been used in a figurative way, meaning music that is vapid, shallow, childish. But to think that music can be "indecent," in the ordinary sense of the word, is to mistake the limitations of the art. For music has its limitations; let us not evade that point.

Frequently, composers and performers try to force music to say and do things that belong to the realm of literature and the plastic arts. They try to make music metaphysical, religious, geographic, historical—everything that it is not.

They try to make it moral or immoral, denominational or sacrilegious, decent or indecent. Music may be associated with these ideas, but it is not such in itself. Certain music may be associated with certain religious ideas for a long time and so, in its presentation, bring back to mind these ideas. Certain other music may be associated for a long time with other ideas which one age or country considers indecent, though another may not.

It must be remembered that the morals of one age or location may be the immorals of another. But music in itself, is the same. Deduct the associations and music has no religion, no vice, no politics, no country. All music is decent, though a good deal of it is weak, and badly afflicted with curvature of the spine, to say nothing of rhythmic eczema and St. Vitus' dance. That has to do, however, only with its technical construction and not with its sentiments or morals.

If certain tunes are so firmly attached to indecent thoughts that the playing of them causes brainstorms in the minds of the young, then it is well to omit their performance, clean off the slate and give music a new deal. But this simply is because the Muse, in her defenseless condition, has been dragged into bad company and her garments soiled by contact. The goddess is immaculate, pure and undefiled In her nature she can be nothing else.

Moment's Notice Repertoire

By Francis Kendig

SINCE pianists are supposed to be able to play anything they have ever known, at a moment's notice, regardless of the multitude of intrusions which may come into their practice period, it is really necessary to keep up a certain repertoire which can be called upon at any time. This need not be a large one. Six pieces should be sufficient. People do not care to listen to more than six pieces at one time, as a rule, and often two or three are all that are necessary.

Select six pieces which can be played from memory. Do not take the most difficult things you have ever played. Instead take those of different appeal and different degrees of difficulty. Select numbers in various keys. Have variety in major and minor mood and otherwise. Let harmony or chordal work predominate in one, another may have melody pure and simple, in another strive for brilliance and facility, and in another choose something fundamentally rhythmic.

After the six pieces have been selected, play them all over, straight through the list. Then select the one which goes best, and practice it till you can do it flawlessly. After you are satisfied with the interpretation which you are able to give this, give the second best piece the same treatment, and continue on through the list.

When this has been accomplished, go through the entire set at least twice each day. Play each piece slowly, mentally conscious of each note, tonal gradation, and, preferably, counting aloud. Then play the piece up to speed, with the mind keenly alert that everything is as perfect as you would want it to be if Paderewski himself were listening to your rendition. Some pieces will take more than twice going over each day. Give them what they need. Almost every number will take a little extra brushing up now and then.

There will be some pieces on the list which you have played a great deal, and this will probably be the first one to change. When you have decided to drop one of the six, or if there is another piece memorized and polished ready to take its place, let the old piece go. Do not try to add one piece, making seven. As soon as you have a new piece ready for public performance, discontinue the piece which you have played most, or the one which is least effective. Incidentally, it is a good test of one's interpretation to study which pieces really go "over the footlights!".

Following out this method one has an ever-changing cycle of six pieces which can be played creditably without the usual tiresome excuse—"out of practice." It is not to be expected that one will ever be entirely satisfied with the rendition of the entire list. The list will not change rapidly, and when a piece is dropped, it need not be dropped forever. On the contrary, it merely may be given a rest, and included in another season's repertoire.

Unless a pianist is putting in the necessary hours for maintaining a high degree of artistry, there must be some happy medium that will keep up an acceptable repertoire. It is bad for one's musicianship, professional reputation and personal pride to be out of practice. In order to divide correctly the time spent on new material and the concert repertoire, a conscientious month-in-and-month-out following of the "six pieces" method will be found immensely satisfactory in maintaining one's ability to play at any time and to always play well.

How a Famous Engineer Studies a New Composition

A Practical Talk on Study Analysis

By VLADIMIR KARAPETOFF

Professor of Electrical Engineering at Cornell University, Ithaca, New York

Biographical

Vladimir Karapetoff was born on January 8th, 1876, in St. Petersburg (now Leningrad), Russia. Went to public schools in Baku and Tiflis, in the Caucasus. Graduated as a Civil Engineer in Petrograd in 1897 and later studied electrical engineering in Germany. Came to this country in 1902, and has been on the engineering faculty of Cornell University since 1904. Author of "Experimental Electrical Engineering," "The Electric Circuit," "The Magnetic Circuit," "Engineering Mathematics," and of numerous articles and papers on engineering subjects. Research editor of the "Electrical World" since 1916. Acted as consulting engineer to several industrial corporations.

As was the case with many Russians of the better class before the Revolution, Vladimir Karapetoff was allowed by his parents to study music as an avocation, without any thought of making a professional musician out of him. While in the high school he was also enrolled in the Tiflis Conservatory of Music, a branch of the Imperial Conservatories of Petrograd and Moscow. Here he studied the piano and the 'cello. Later he continued his piano work under two prominent teachers in Petrograd. He also studied the 'cello in the Ithaca (N. Y.) Conservatory of Music for three years. By properly arranging his daily routine work, and economizing time whenever possible, Professor Karapetoff has been able to keep up his technic on two instruments, and continues to give public recitals throughout this country, in connection with his numerous speaking engagements on engineering subjects.

He is a recipient of the Montefiore prize for his electrical inventions and is an honorary member of the following honorary societies: Eta Kappa Nu, Tau Beta Pi, and Phi Mu Alpha (Sinfonia).

For a number of years he has been interested in the idea of increasing the range of the 'cello upward by the addition of a fifth string, an E, one-fifth above the regular 'cello A. He finally succeeded by using a steel string, and now uses his five-string 'cello regularly. This makes it possible to play advanced pieces without difficult thumb positions, and also enables him to play many violin pieces an octave lower than they are written.

MUSIC is not my profession; I am an engineer and a teacher of engineering. In my childhood, in Russia, I studied the piano and the 'cello under good teachers, and the most valuable part of their instruction proved to be that they taught me how to study pieces by myself. My scientific training and, perhaps, my natural analytical temperament have helped to develop their precepts further into a code of rules which I have followed throughout life. The best proof that I can offer as to the soundness of these principles is that I have been able to keep up my technic and a repertoire on two instruments up to the present time (I was born in 1876), and every year give one or more public recitals on both instruments. Some of my precepts are purely introspective, and as such can hardly be formulated in plain words, without using psychological terms. However, I shall endeavor to give you as much as I can, hoping that these precepts may help you and, through you, may help to raise the standard of musical appreciation in this country.

My principal precept in studying a piece of music is "analyze," or, in plain English, "split, split, and split." First of all it means never play or sing a musical composition repeatedly from beginning to end, while studying it. After you have found out the difficult passages, concentrate your attention on these, and keep on splitting each passage until you have discovered the simplest elements each of which, by itself, does not seem difficult. Then begin putting these elements together, and you not only have learned the passage but you have added to the flexibility of your mind for the rest of your musical life.

This splitting or analysis of difficult passages may be done on this or that basis, depending upon the nature of the difficulty, I have found the following methods helpful.

(1) *Melodic Analysis.* Divide the passage into simple melodic phases, each "satisfying" in itself. Even in instrumental music it is helpful to assign simple sentences to each melodic bit; for example, "Is it you?" "Let us go," so as to add unconscious phrasing and connection to such melodic bits. No matter how a phrase is actually written on paper, play or sing it to its logical end. In many cases this means to an accented note. For example, in a long passage consisting of triplets you will find a much better and simpler melodic phrasing by thinking from the second note of a group to the first of the next group. This makes a group of two unaccented notes followed by an accented note, of the form "let us go," with the accent on the last syllable.

(2) *Harmonic Analysis.* Name all the principal chords and modulations in the phrase which you are studying. You will be surprised how much this will add to the ease of memorizing a piece, to an intelligent phrasing, and to your feeling as one with the composer. I cannot urge too strongly a study of harmony at a young age. This will also help materially in ensemble playing, choral singing, accompanying, or reading new music. Even if you are a violinist or a singer, you need harmony just as much as a pianist or an organist does. Otherwise you are only half a musician.

(3) *Rhythmic Analysis.* Emotions cannot be expressed in music apart from a rhythmic "texture," and only a few great artists have fully mastered this subtle means of expression. With most performers, the rhythmic gradations of force and speed are either not prominent and varied enough or are too evident. Make up your mind how you are going to play or sing a particular phrase with respect to the relative accents slowing down, speeding up, rubato, and other features, and how you are going to contrast the phrase rhythmically against the ones preceding and following them. Look at a good oil painting very closely and learn what "texture" and "contrast" mean, and how different objects are approximated with a different kind of rough or smooth paint surface. Without texture the picture would look flat, like an amateurish water-color sketch.

(4) *Mechanical (or Anatomical) Analysis.* By this I mean a careful planning of the best utilization of your fingers, hands, arms, body posture, bowing, control of the facial muscles (in singing), and so forth. You know from your own experience how much is gained by adapting the means to an end, when you use a knife, a fork, a hammer, a needle or a tennis racket. So why always use parts of your body in the same stiff manner when performing such a delicate operation as playing or singing? Find the way in which you can play or sing a certain succession of notes in the easiest way, and it will look graceful and natural. Do not try always to hold your hands or the bow in the same stilted way, but always hold them in the most appropriate way for each particular kind of difficulty, the way thought out and experimented with in advance. There are narrow hands and wide hands, flexible hands and stiff hands, short fingers and long fingers; and no one fingering or method of holding the hands can possibly suit everyone.

PROF. VLADIMIR KARAPETOFF

(5) *Tone Color Analysis.* Always think of a listener who has a fine appreciation of tone quality and of its varieties. When Anton Rubenstein played the paino, one was seldom conscious of the instrument itself, with its harsh ivory keys and steel strings, but always, one was reminded of an orchestra, a violin or possibly a murmuring brook. The pianist and the organist should mentally strive to represent an orchestra or at least some ensemble of instruments. A violinist may think of a female voice, a flute, a cello, or whatever medium renders a particular phrase the best. A vocalist should cultivate changes in voice quality as much as possible, adapting it to the sentiment expressed. It is remarkable how much can be achieved in this respect, once a conscious effort has been made to learn the ways and means of bringing out the possibilities of one's instrument.

(6) *Analysis of Emotions.* The purpose of singing or playing an instrument is to arouse in the hearers certain emotions, akin to those which the composer and the performer together are endeavoring to express. Are you merely a postman who carries a sealed message from the composer to the listener and who knows nothing and cares nothing about its contents and intent? Or have you made the composer's message your own and are expressing it through your own emotions? Think of the difference in the impression which you can hope to produce on the listener in these two cases. Contortions, long hair, and rolling up of your eyes, will not fool many. They want a message of love and beauty; and the only way you can give it to them is by learning how to express them in music, the ideal love and the sense of beauty which you must cultivate in your real life, apart from music. As to how to accomplish these ends, the precept is very simple: "Seek and ye shall find."

After you have analyzed a section of a composition from the above points of view, put your findings and results together, and in so doing you will reconstruct the piece as if you yourself were the composer. It "soaks" into you, becomes an organic part of the contents of your consciousness, and then its effect upon the audience is limited only by your musical personality.

In addition to the foregoing six rules I have also found the following ones useful:

(7) *First Fill in the Holes and Cut off the Bumps.* This means: Do not play over and over again a phrase which has both difficult and easy passages. Otherwise, the difference will be always apparent to the listener. Work only on the difficult notes, just like a skilled journeyman painter who before giving a final coat of paint to a dilapidated wall, first fills in the hollow parts and cuts off the projecting parts. If he were to paint over the original rough surface no number of layers of paint would make it smooth. Again, think of a macadam road with a small dent in it. Every passing vehicle

makes the dent bigger and deeper until the road has to be closed for repairs. The proper thing to do is to fill in the dent in the beginning.

(8) *Practice on only one difficulty at a time.* If you are trying to get a large interval clear and pure, practice on it alone; do not play or sing the notes which lead to it or follow it. If it is three notes against four that is troubling you, practice the difficult rhythm on a repeated note; do not add the difficulty of a melody or of a harmony to that of the rhythm. No matter what the difficulty is, separate it out and overcome it alone.

(9) *Make your own exercises.* If you learn to analyze your technical difficulties and their causes as explained above, you will never want to practice complicated studies written for you by some one else. This, of course, does not apply to pieces like some of the Chopin etudes, which have a high musical value and are played in recitals. I have in mind dry complicated concoctions of old-fashioned musical pedagogs, which are becoming as obsolete as complicated prescriptions of the medics of the past generation. You want to know your scales and chords as the foundation of all music, and you want to know them by heart and in all forms, such as staccato, legato, and varied rhythms. Beyond this, make your own exercise out of each difficulty as it comes up. You (or your teacher) can make such exercises to fit your particular troubles. Playing printed exercises is like sharpening several special and complicated tools when there is nothing to cut. It is only by trying various exercises of your own design that you analyze each difficulty down to its very root.

(10) *Margin of speed, strength, and emotions.* Why is it that a great artist can play or sing a simple composition and make a deep impression, while you cannot do so, even though technically you can cope with each difficulty in it and you feel the composition very deeply. An important reason is that a great artist has a large margin of safety in his execution while you have only a small one. He can play the same piece much faster, with much more volume, and with much more emotion than he actually does. He gives you only a small part of it all, and the very feeling of assurance that he has that big margin adds to his success and to your enjoyment. Two performers on the vaudeville stage do the same acrobatic stunt. One is an Adonis dressed in glittering tights, but he just barely clears the obstruction. His partner has baggy trousers and a painted red nose, pretends to be awkward, but when he does the same act you know that he is the real artist with a great margin and could have performed a much more difficult feat. Again, what do you enjoy more in a person's conversation? A rehash from the last book he just finished reading the day before, or his own personal views that he arrived at as a result of years of experience and observation? The moral is: Get as big a margin as you can in what you sing or play. Do not strain to the last.

(11) *Study more difficult pieces than you perform in public.* This precept follows directly from the foregoing rule about a margin. Do not foist your imperfections on your audiences. Many a promising young musician has ruined his or her career by trying to perform in a public recital compositions which only veteran artists of the first rank should play. Liszt, Paganini, and writers of difficult coloratura arias, not only died their natural deaths once, but also have been murdered over and over again by their young injudicious admirers. When a teacher causes his pupils to play or sing in public a difficult piece of music just learned, he commits an unpardonable sin against the rule of margin. In public you should perform simple pieces, which you can play easily and in which you can show your real personality and artistic temperament. In private it is better to study more difficult pieces, provided you analyze them and overcome each difficulty intelligently. This will take the place of the stupid old-fashioned "daily exercises" and will give you the required margin, poise and refined taste.

(12) *You never learn a piece completely, you only approach it.* A first-class musical composition reveals itself to you more and more as your life experiences mature you and as your tastes and emotions become more refined. Your technic becomes better, your tone quality richer, you learn to express your feelings more forcefully, and you naturally play the same piece better. Hence, you cannot "learn" a piece and then use it like a phonograph record or a perforated roll. Study a good classical piece all your life, at intervals, and it will gradually become more and more closely assimilated with your sub-conscious mind. For this reason, do not hesitate to lay an unfinished piece aside and start on something else. Only be sure that you have done at least something definite on it, for example, that you have learned certain passages, had others marked or fingered, made clear to yourself the general correlation of the parts. You will enjoy taking this piece up again after a while.

Summing up, I would say: *The first function of a good music teacher is to train a pupil to think in musical terms and to analyze technical difficulties. Then, if the student possesses the required mentality, application, and musical temperament, he will continue to progress even without the teacher, in proportion as he splits, splits, and splits difficult passages, as explained above.*

[During the talk, the speaker illustrated his rules on the following piano pieces: Liszt's familiar "Dream of Love," the cadenza before the return of the main theme; Chopin's Valse, Op. 42, the first four measures of the theme; Beethoven's Moonlight Sonata, a few measures of the slow movement.]

Professor Karapetoff's remarkably clear and practical article will prove immensely helpful to many. Others will be inspired by the fact that from a very busy life he has been able to snatch moments sufficient to enable him to do what thousands of music teachers seem to be unable to do—to give recitals which really delight audiences. It is interesting to note in this connection the actual callings of famous Russians who were best known for their music, music cultivated at first as an avocation and not as a profession.

Rimsky-Korsakoff, originally naval officer.
Borodin, originally chemist.
Cui, originally artillery officer.
Tchaikowsky, originally lawyer.
Dargomijsky, originally government officer.
Mussorgsky, originally army officer.

Listening to Learn From Master Pianists

By Harold Mynning

Some of the best lessons we ever learn are the ones we get from listening to those who have mastered the art of piano playing. The characteristic qualities of a few follow.

Wilhelm Bachaus is one of the greatest living technicians, plays with great power, and executes the *Second Hungarian Rhapsody* of Liszt in an especially superb way. From him one learns that some of the greatest obstacles may be overcome by the most simple means. His stupendous technic is due in part to his wrists being always relaxed. He may not be conscious of it, but his wrists are kept constantly relaxed by moving up and down whenever there is a rest, a pause, or when the nature of the passage allows him to do so. This is done gracefully, of course. In a recent article he said, "Relaxation is really a simple matter. For instance, when one plays a chord, there is a slight tension of the wrist, but when the chord has been played, the wrist is instantly relaxed."

From Harold Bauer one may learn that proper gestures have much to do with making the music live.

Mischa Levitski exemplifies the value of the lateral movement of the forearm in a perfect technic. This refers, of course, to a sidewise movement of the forearm, and this may be practiced by picking out from various pieces the passages where the arm is moved from side to side.

Paderewski is the great exponent of the importance of making the soft tones sound clearly. Most students give far too little attention to these subdued notes.

Benno Moisevitsch's playing illustrates the importance of well-placed accents. Scarcely any feature of music produced by the piano gives to it more vitality than accents of the right type, at the right time, in the right place. Students, take notice.

Josef Hofmann teaches eloquently in his playing the lesson of "reserve power." "Never let the public know your limits," says this great artist, and in his playing he "practices what he preaches."

Josef Lhévinne and Leopold Godowsky are especially brilliant in octaves. Godowsky has been seen to play an octave passage of great difficulty during which the wrist did not seem to move at all. Evidently this great artist gives a good deal of attention to the movements of the wrist and arm.

From these gleanings, it is readily seen that valuable lessons are to be had from attention to the playing of others. Keen observation is one of the most valuable attributes of the student.

The Teacher's Creed

By Dana Thomas Harmon

I believe in myself, my pupils, my ability, my pupils' receptiveness.

I believe that, with divine help, I can benefit humanity, make this old world a better place to live in; death merely a passing on to a better life through my gospel of music.

I believe that my work is a university for self-development; and a great storehouse of happiness for others.

That music is the finest of fine arts; the most inspirational of all arts.

That in devoting my life to conscientious effort and fair treatment of my pupils I will be blessed with a happy old age, and with the knowledge of a life well spent can wrap the mantle of my life around me and lie down to peaceful dreams.

How Long!

By Austris A. Withol

"You can fool all the people some of the time, some of the people all the time, but you can't fool all the people all the time," has been attributed to everybody from Moses to Lincoln. Whatever its origin, the truth at the bottom of it applies as well to the teaching of music as to any other endeavor.

Judging from a collection of "Student's Recital" programs that is easily assembled, it would seem that many a teacher has not yet learned that the working of such a law is inexorable. Master compositions are given to the most immature children; presumably with the thought of creating an impression that the pupil is a prodigy and the teacher a wonder-worker. A ten-year-old girl struggles with a Beethoven sonata. With a month or so of preparation, a young man appears in a recital of complicated works ending with Liszt's *Twelfth Hungarian Rhapsody*. Think you that this is the limit? Not at all.

A lady leaves the washtub for music lessons. The teacher says, "You ought to appear in my next recital."

"When is your next recital?"

"Three weeks from today," replies the musical sage.

Then follows an interesting discussion as to what the student shall play, as she has not practiced for the deuce only knows how long; and at that, she has taken but a few lessons in her sweet life. With one lesson in each of three weeks, figure out, dear reader, what the student played at that recital? Only the "G Minor Prelude" of Rachmaninoff!

At first thought one would write a sermon of flaming expletives against such nonsense. But what's the use? The ones at which it would be aimed never would read it.

Most listeners prefer compositions with simple melodies rather than the complicated works of the masters, at least unless these latter are interpreted by master players. Hundreds of these exist if we but seek for them. It is far better to play a small piece well than that we mutilate the masterpiece.

Have you heard the story of the San Francisco amateur who could play Beethoven, Liszt and everybody else that is big, but from whose piano the action had to be removed to prevent his ruining a concert? How long shall we endure this condition? How long shall we work to show off a little of that which glitters rather than that we express a beautiful idea beautifully and thus add something to the total of happiness in the world? How long till a better day? How long?

Music But Partly Realized

By Roberto Benini

Campanella, born in 1568 and died in 1639, wrote, "If there were an instrument for the ear, by which we could enlarge the faculty of hearing, as the faculty of sight is increased by the microscope and telescope, we should become acquainted with an entire polyphonic tone-world, inasmuch as all motion produces waves of sound."

In the light of comparatively recent achievements, these words of three centuries ago read quite like prophecy. With radio an accomplished fact, and its possibilities expanding, who knows what the near future may have in store in the way of sifting from the air sounds not made by man nor of the earth?

Artistic Pedalling

By LESLIE FAIRCHILD

Rubinstein's "The pedal is the soul of the piano" has become an adage. It would be far better to say that the pedals are the means through which the soul of the pianist is expressed.

With the proper knowledge and technic of the pedals, one is able to infuse into his playing actual life and sunlight. Brilliant cadences, highly colored chords, mysterious echoes and diminuendo effects, clanging chords and octaves of great volume, and many other charming effects are at the command of the pianist who has acquired a skilful use of all three pedals.

There is no branch of pianoforte study more neglected or so much abused as pedalling. To many, the damper or right side pedal is used as a tread to beat time on, and to others it is used as a means to augment the tone. Thus, the reason for its being labeled the "loud pedal." As far as the *una corda*, or left side pedal, and the sustenuto, or middle pedal, are concerned, their use seems to be entirely foreign to many advanced pianists whom you would expect to more familiar with them.

The Ear, the Judge and Jury

Artistic pedalling requires the most serious kind of studying and experimenting in order to bring out the most beautiful effects in a composition. Nothing should be left to chance. Our ear is the final criterion to go by, and we should cultivate the habit of listening attentively to every tone that is produced in our daily practice.

Most talented pupils use the pedals to fairly good advantage; but no doubt their talent would be greatly enriched if they were thoroughly grounded in the fundamental principles that underlie artful pedalling. A composition that is artistically pedalled may be likened to a beautiful painting with its exquisite blending of colors and properly placed high and low lights. Poorly pedalled, the composition becomes flat, like a crude lithograph or line drawing, void of all rich and harmonious shading or colorings. Modern compositions demand highly colored effects and those who lack the ability to create such will lose the entire atmosphere of these pieces. There are passages in many of these modern works in which the pedal is "everything."

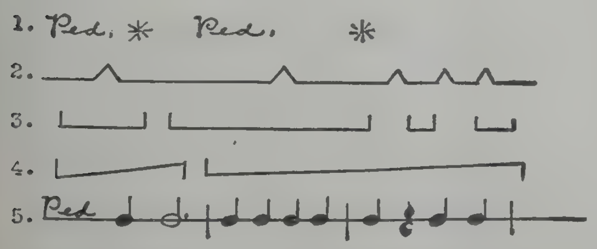
Deficient Pedal Markings

Many composers are notorious for their neglect of good pedal marks, leaving them to the discretion of the player. This may be perfectly all right for the exceptionally talented pupil, or the one who has a teacher who is capable not only of marking the correct pedalling but also the most artistic; but it is of little value to the less fortunate. Percy Grainger's editions are models of modern pedalling; and the student will be well repaid for studying them No pedal mark has been left to chance, every detail having been worked out as carefully as the notes; and by their use the student is able to catch the real atmosphere of the composition.

The pianist should always sit at the instrument with both feet over the pedals, not only for the sake of good deportment but also to have them ready for instant use when needed. In some passages it is required to use all three pedals simultaneously. This is done by turning the left foot so that the ball of the foot presses down the una corda and at the same time allows the tip of the foot to manipulate the sustenuto pedal, the damper pedal being used in the regular manner.

Pedal Signs

Numerous signs have been devised to show at what points the damper pedal is to be pressed down and released, such as:



The one shown at "5" is no doubt the most accurate of all, as it shows the exact time value for the duration of the pedal, and its release. It is probably not so popular as those shown from "1" to "4", owing to the extra labor required to mark it out.

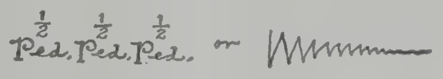
An insight into the workings of each of the three pedals will enable the student to use them to better advantage.

Pedal Mechanism

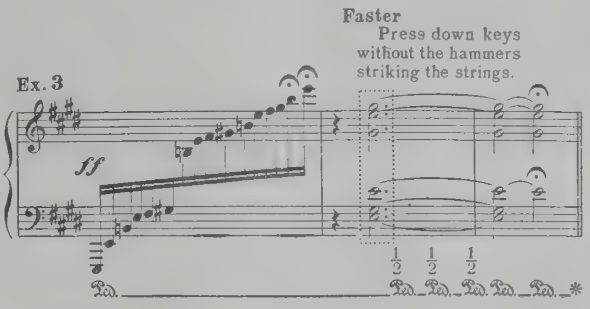
Felt wedges that press against the strings are called "dampers." When a key is depressed this damper is released from the string, allowing it to vibrate as long as the key is held down. When the key is raised the damper flies back against the string and immediately stops the tone.

There are many instances where tones are required to be prolonged; yet their distance is so far apart that it is impossible to hold them with the fingers. In such cases the damper pedal becomes of the greatest value. By simply pressing down the right side pedal, all the dampers are released from the strings allowing any notes that are played to vibrate until the pedal is released. If it were not for these skilfully constructed dampers, our playing would sound like one continuous blurr.

There are three ways of employing the damper pedal: first, taking it simultaneously with the note; second, pressing it down immediately after the note or chord is struck (this method being called legato or syncopated pedalling); third, what is called half pedalling or trilling the pedal, which is designated by signs such as;

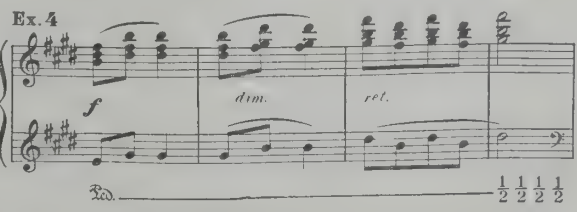


By this method the dampers are made to arrest partially the vibrations of the strings, thereby causing unusual effects that will be shown in the following closing measures from Percy Grainger's *Colonial Song*.



Faster
Press down keys without the hammers striking the strings.
Ex. 3
ff
½ ½ ½
Ped. Ped. Ped. Ped. Ped. Ped. *

Then, in this quotation from MacDowell's *To A Wild Rose*,



half pedalling creates a beautiful diminuendo of the sound volume that has accumulated under the damper pedal.

Sympathetic Vibrations

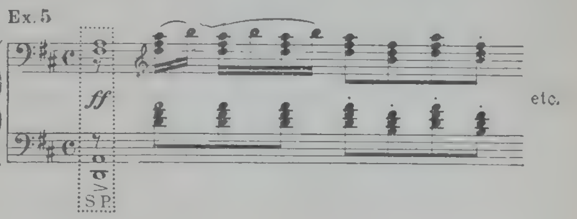
Another very valuable adjunct to artistic pedalling is made by making use of the law of sympathetic vibrations. The principle of this can be very easily illustrated if the student will press down the damper pedal, thereby releasing all of the dampers from the strings; then by strongly singing any tone directly at the sounding board, there will be immediately set up sympathetic vibrations with this tone that will resound back in answer to the note sung.

Another demonstration of the law can be shown by pressing down the middle key "C" silently. On striking "C" one octave below with a sharp staccato blow you will immediately set the "C" above in sympathetic vibration, and it will be heard to sing very softly—as a sort of an echo.

The Sustenuto Pedal

The possibilities of the sustenuto or middle pedal are greatly overlooked by the average pianist. Many do not seem to know that it even exists. This remarkable aid to artistic piano playing (the invention of which is accredited to Steinway, of New York) should be studied so well by the student who wishes his playing to rise above the ordinary that he will become as familiar with it as he is with the damper pedal.

By using the sustenuto pedal one is able to sustain single notes or chords while at the same time other notes or chords at different parts of the keyboard are played staccato.



The above passage is from Rachmaninoff's *Polichinelle*, and illustrates the effect just mentioned. Similar phrases are encountered quite often in the works of this Russian master.

Making use of the law of sympathetic vibration in connection with the sustenuto pedal, we are able to create many charming effects, and examples of this will be given below.

When using the sustenuto pedal the notes to be sustained must be pressed down and held before the sustenuto is depressed. Care must be taken to have the damper pedal fully raised before pressing the sustenuto pedal or the whole damper system will be sustained.

The Una Corda Pedal

Ordinarily, the hammers deliver a blow to three strings. On a grand piano the hammers are shifted over to one string when the una corda (meaning one string) pedal is pressed down, thus giving the tone a softer quality. In some lately made pianos this pedal allows two strings to sound, but the old name still persists. Many charming effects are produced by the use of this pedal, and also by combining it with the damper and sustenuto pedals. In Grieg's *Wedding Day at Troldhaugen*, the una corda pedal enters at the end of measure ten, giving a most charming subdued effect.

A fault of many players is that they do not press the damper pedal down to its full stroke, nor do they fully release it, thereby partially arresting the vibrations of the strings, which causes a muddy effect. Clean, crisp pedalling should be mastered by all who aspire to pianistic heights of interpretation; and this is achieved only by diligent practice and intense listening.

The Pedal No Cloak for Deception

The pedal should not be used as a cloak to cover up a slovenly technic, for this deception will fool no one except the one who is trying to use it as such. The various tones on the piano may be considered as a large paint box of the primary colors, and the pedal as the medium in which they are mixed in order to combine them into multitudinous shades and tints that will rival those of the rainbow.

Finally, the pedalling that is designated in most editions simply gives a suggestion of what should be, leaving a vast field for the student to combine and blend the tones to his own artistic taste.

Self-test Questions on Mr. Fairchild's Article

1. What physical organ is the "Judge and Jury" of piano playing?
2. In what ways are pedal markings deficient?
3. How is the mechanism of the piano affected by the pedals?
4. How do "sympathetic vibrations" influence the artistic quality of the tones of the piano?
5. What is the effect of the "sustenuto" pedal?

Applause, the Smoke of Fame

"Applause is the smoke of fame." The student, particularly the adolescent student, should not be deceived by applause. Real worth counts, with or without applause. It is said that when Schubert was doing some of his finest work as a composer he was also serving as an accompanist for his good friend, the renowned tenor, Vogl. Vogl was the Caruso of the day in Vienna. Everywhere he went he was lionized by the ladies. Schubert was immensely grateful to him for introducing his songs. Schubert eagerly accompanied him at the piano, and at the end of the songs Vogl was surrounded by groups of enthusiastic admirers, applauding him vociferously. Meanwhile the immortal Schubert would sneak out of a back door timidly dodging the applause which his own masterpieces had produced. Vogl was wreathed in the smoke of fame. Schubert was resting on the granite of immortality.

Overloading the Child Pupil

By Joseph George Jacobson

"It seems that all my pupils, who are beginners, have exceptionally weak fingers," said a young teacher recently when I was watching her giving a lesson to a little seven year old girl. She was trying to make her hold down two fingers and play with the others and this in the second lesson.

"Would you be able to lift fifty-pound dumb-bells in each hand?" I asked her at the conclusion of the lesson. When she replied in the negative I told her that that was about what she was attempting to make the little girl do.

Imagine a little finger, untrained, being put to such a strain as holding down keys and moving the other fingers. Some years ago I had the opportunity of watching one of the greatest prize fighters train for one of his boxing-bouts and noticed that most of his work was being done with two-pound dumb-bells. Very rarely did he use heavy weights and then only to show off before an audience. He said he would be afraid of getting a strain and would not acquire endurance. Now piano-playing is not exactly a boxing-game, although with some of our concert artists you are reminded of it with the difference that one of the contestants is helpless.

Much harm is being done with too strenuous exercises at the beginning which cause strains in the little hands. Stationary exercises should not be used for many months, if at all. Do not get worried if the hand wobbles around at first, it cannot be avoided and is better than to force it too much. More important would be to advise the pupils to play softly; they generally thump, using the strength from the arm. You will find the hands remain in a steadier position when they play *piano*. Do not bother them too much at first with scales. If after, say about eighteen months, they know well five scales, C, G, D, A and F, they have done well. Be careful also about too many stretch exercises, but begin soon to develop the wrist, using extensions of sixths. Use a good modern piano-method and play duets with the pupil with an easy part for the student and a more difficult one for the teacher, like Low and Sartorio duets. This will accustom the pupil to music she would otherwise not be able to play for years.

Rhythmic Analysis

By Edith Josephine Benson

A definite way of studying rhythm is more effective than a mere cognizance of meter signature and note and rest values. My five and six-year-old pupils clap the time of their music before they play it. Sometimes we make a duet, the pupil clapping the rhythm of one staff while I clap the rhythm of the other. Even small children can seek out the measures in a composition that are to be counted alike and the number of measures that are to be counted differently and lastly, they can copy the notes and rests of certain measures, without using the staff.

In every composition that has complexities, my older pupils count the number of measures that introduce new features in time values, and sometimes copy notes and rests. To dissociate time from pitch, staff-ruled paper is not used.

In teaching a phrase that begins at the end of a measure, I often explain that the first part of the phrase is not accented; the phrase is like a sentence that begins with unstressed words. Sense accumulates toward the end of the sentence, as in "I go to church to-day," "*I expect to read tonight.*" Such illustrations are frequently more effective than explanation that the end of a measure is weaker in accent than the beginning of a measure.

Motives can be analyzed also by observing: (1) Rhythmic structure; (2) Where the motive begins, whether on an accented or unaccented beat, or the second half of a beat; (3) On what other beats the motive occurs and how the change affects the accent in the motive; (4) Changes in structure of motive by lengthening or shortening tones or repeating a note, as 𝅗𝅥 repeated ♩ ♩. Rhythmic analysis clarifies problems in accent and relative values of notes and rests.

"Among contemporary innovators, some have very good reasons for writing as they write. In due time these reasons will be obvious to us all as are now the reasons that prompted the innovators of yesterday to ignore yesterday's conventions. But to ignore conventions is not the only thing that matters."

—M. D. Calvocoressi.

Saving a Masterpiece From the Flames

By Oscar L. Bechtel

Creative workers are notoriously bad judges of their own works. It not infrequently happens that a master will select from his compositions some work which he feels is certainly the greatest, which the public and posterity never identify as such. This was often the case with Beethoven. The story runs that when the great Viennese tone poet was in one of his despondent moods he was visited by the court singer, Barth.

"What have you got new?" asked Barth.

"Only this," answered Beethoven; "but it is so worthless that I was just going to put it into the fire."

"Let us try it," exclaimed Barth.

The composer sat at the piano and played while the singer ran over the melody.

"Burn this!' shouted Barth, "why this is a masterpiece!"

The composition was Beethoven's best known song, "Adelaide."

Interpretation and Intelligence

By Sidne Taiz

These two are so closely related that they can scarcely be separated for consideration. A composition, to be worthy of one's time and study, should have some property that will leave some definite impression with the listener; it must have some message for the interpreter. This may be nothing more than the vigorous, inspirational spirit of a march; it may be the gaiety of an idealized waltz; it may be the soul tragedy of a *Sonata Pathetique.*

Now if its message, its spirit or its soul is to find any place in the interpretation of a piece, the performer must catch and feel this so strongly that it will become a vital part of her rendition. How evident then that the composition shall not be beyond the ability of the student to comprehend, that it shall not be beyond her ability to overcome its technical requirements to the extent that they shall not interfere with her entering into its inner spirit. How much better that a piece of salon music shall be renedered with some show of intelligent comprehension of its mood than that a master work be given with a wild scramble to get the notes.

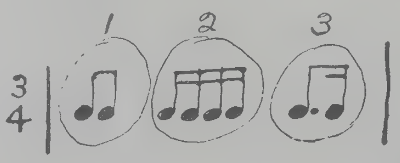
Study well the capacity and capability of the student, give work within her ability from every viewpoint, and yet something that will gradually lead to more advanced achievements in each direction. So many faculties must be developed. Try to keep each well employed. Try to lead each steadily to a larger growth. But in all things use discretion.

Teaching Beginners to Count

By S. E. Spratt

Many teachers experience no difficulty in teaching young pupils to count whole, half, quarter, or notes that require from one to four beats to the single note; but when it comes to playing groups of notes, as eighths, sixteenths, or dotted notes, the students often cannot seem to grasp the relation, even when it is explained in a clear manner.

A good plan is to draw a ring around a note, or certain groups of notes that designate one beat, and then write the count above numbering them. Very young pupils soon catch on to this simple rule, and after a few lessons, play readily without marks.



Anton Bruckner's Little Request

Bruckner was once given an audience with the Emperor Franz Joseph, who admired the genius of his subject. It was at a time when the Viennese critics, particularly Hanslick, were attacking Bruckner's works.

"What's troubling you?" asked the aged Emperor. "You evidently have something on your heart."

"It's that Hanslick," replied Bruckner. "He is always tearing me to pieces in the *Neuen Freien Presse.* I wish that your Majesty would give that fellow a good sharp talking to."

Counting With the Pupil

By Earl S. Hilton

Counting *with* the pupil helps. Of the many ways it helps, here are three.

It helps give the pupil courage.

Many a pupil does not have the courage to believe that he can both play and count at the lesson. In this case the teacher should count while the pupil is reciting, and should insist that the pupil join in the counting at the same time.

It helps the pupil to play smoothly.

There are some pupils (especially adults) who claim they "can't count aloud." They say that they count "to themselves." But in this manner of counting the teacher is not sure the pupil *knows* that his playing is in uneven time, or that he might be counting to himself wrongly. In this case the teacher may count aloud while the pupil plays smoothly.

It helps the pupil to overcome self-consciousness.

Pupils who have been in the habit of practicing without counting usually play very much out of time. If they would count aloud, smoothness could be much more easily attained. But usually these pupils have played so long without counting that they feel foolish or self-conscious at the sound of their voices. In this situation the teacher counts aloud while he himself plays, then also while the pupil recites. And, while the teacher is playing, he might require the pupil to count aloud.

Systematize Your Study

By Mrs. C. H. Carpenter

Do you have a system to your music studies? If you do not, then you are probably not making the progress you might if you had a regular schedule for studying and practice and would utilize this assigned time punctually. Much more advancement can be made in music by systematizing your study than by going at it at random.

Try it. Get a little note book and set down in it a scheduled time at which each day to practice and study your music, and note just how long you are at practice. Then live up to your schedule religiously. It will not be long until you will notice yourself getting along better. If you would try this plan it might surprise you in a short time how well you are doing.

And do not make the study period just so much time to get through or a certain amount of music to practice over, but make it a period of real study. Learn to enjoy your study. Get all the pleasure out of it that you possibly can. Work hard. You will soon find that the regular practice period you have set will seem short.

But the main thing is to have a regular time of day to study and practice, a regular length of time for it and to get in the habit of thorough and conscientious using of this period each day.

Thinking Music Irrespective of Keys

By John E. Carney

The musical architecture of a composition remains the same no matter what key it may appear in. If it were possible to make a "graph" apart from the keys, it would have a definite rise and fall which would express it pictorially.

Very early in your musical life you should begin to think of music irrespective of any key, if you can do this. That is, if a piece is printed in the key of A-flat, you should be able to conceive of it in any other key. Only in this way do you get the true musical perspective.

Most of the great masters have been able to transpose their works instantly to other keys. Beethoven, Brahms and von Bülow were famous for this. Once when Beethoven was called upon to play his *C Major Concerto* in public, he found that the fixed pitch of the wind instruments would oblige him to play the concerto in an entirely different key. This of course he did with the greatest ease.

Young children should be taught the different keys through scales and through tonality exercises so that in their work it may become perfectly natural to them to transpose little melodies to any desired key. There is no more reason why they should not do this than why they should not be able to read script and print with equal ease. Script is often quite different from print; but the child soon finds it equally easy to read the same thought expressed in either print or script.

Pianistic Talent and Race

By the Distinguished European Pedagog

RUDOLF M. BREITHAUPT

[This thought-provoking article has been translated expressly for THE ETUDE, from "Die Musik," by Miss Florence Leonard, Rudolf Breithaupt's American representative. The publication of this article does not imply that the author's opinions are endorsed by THE ETUDE. In some respects we do not endorse these views.]

RUDCLF M. BREITHAUPT

THE talent for playing an instrument is primarily a question of race, that is, it is more a matter of blood, heredity, and predisposition (tendency of the nerve centres) than of general physical organization, training and education, atmosphere and culture.

Long experience teaches that the interpretative arts derive their finest and most original manifestations, not from technic alone, but the racial springs of blood and energy, and the inherited impulses.

Certain racial characteristics and peculiarities are inborn and not acquired, thus, buoyancy of disposition, receptivity and susceptibility of the nerve areas, adaptability to musical and technical demands, and very rapid transmission to the act of the will (usually called temperament, impulsiveness). Certain traits, as of character, of heart and soul, are inborn, such as energy, firmness, endurance, tenderness and warmth of feeling, ambition, devotion, and love of art.

All these characteristics may perhaps be enhanced and strengthened, but they must first exist in the germ.

There are two races which manifest extraordinary adaptation for playing on instruments, especially on the piano and violin. These are the Semitic and Slavic, and the mixture of them with other races. Alert and agile intellect, quick perception and adaptability, a strong will to play, and a still stronger will for effectiveness, with a keen understanding; extraordinary physical mobility and dexterity, a dazzling memory and ear as well as, in most cases, lack of reserve in manner and action, besides tireless diligence—these qualities have given to the Jewish race an almost predominating position in the interpretative arts.[1]

At all events, the actual creative, constructive talent is rare among them. The frontal portions are more developed than the creative brain areas.

Masters of Style

Intelligence and cleverness outweigh imagination and the higher forms of thought association. The impulse for imitation and feeling, for realization, lead rather to the complete technical power. Ambition and pride, and the mercantile instinct sharpened for a thousand years, often bring money and fame, but lead away from true ideals, and destroy, only too easily, the sources of true musical art.

Great masters of style or builders of form, brilliant conquerors with great spiritual power, with the sweep and might of the genius, are rare instances. The exceptions are truly great, and these great ones are among the world wonders, which are, unfortunately, dying out.

The Slavic race, also, has still an unsubdued energy and unimpaired instinct. It has also a deep yearning, a passionate longing for music, imagination rich in tone-color, delicate, poetic sensibility, hot blood and temperament.

But the wild and impetuous phase of its character, especially a melancholy which is sometimes even self-destroying, a dreadful fatalism which can lead to despair and complete apathy, besides, often, a complete lack of culture, poor education for their children (also a fault among the Jews), over-exertion of the nerves, and over-stimulation of them, relapses into idleness and indifference, laziness and slovenliness (faults which we see embodied today in sacred Russia); these faults may prove to be the fate of this richly gifted race and the curse of its art.

The great intensity of temperament, the sudden transitions (frequently in evidence) from one wave of feeling to another, make their born players of Chopin and Liszt often unfit for presenting the great calm line, the organ-like unfolding and orchestral construction of certain noble styles, like Bach and Beethoven.

Cross Breeding Pianists

The best and most nourishing soil for playing talent is found in the crossing and mixing of the two races, and in the crossing with other sources—German, Hungarian, Rumanian, and others. Excellent combinations are: Rumanian father with Polish Jew mother, pure Pole with Russian Jew mother, or Russian Jew with pure Polish or German mother; also many crossings of Jewish strain with Hungarian, Croatian, Slovakian, Czech—and the mixture of Jewish and Slavic with German blood.

The varied mixture of peoples in the old Austro-Hungarian monarchy on the Danube, the streaming together of all possible race-mixtures, in combination with its great culture, made Vienna the chief city of the art of playing on musical instruments.

The musical quality in German-speaking Austria originated in the old crown lands of Steiermark, Carinthia and Tyrol. The majority of Austrian talent is of mixed blood, combinations of Hungarian, Bohemian, Polish, Croatic-Slovenic and Rumanian-Italian elements, with or without Jewish strains.

The playing-talent of Russia is, likewise, rarely pure Slav. The Jewish strain usually predominates. The South-Russians are more gifted than the North-Russians —the population of the Podolic (?) country, of Kiev, Cherkov, Saratov and Moscow (central districts), the old dwellers on the Volga and the Ukrain, besides the Caucasians (of Arischen strain) and the Grusinians.

Magyar Pianists

The Hungarians—it is well known that the Hungarians are not Slavs, but with the Finns belong to the Magyar race—have almost all the advantages of the Slavic race; but, also, almost all the disadvantages especially the weakness, instability, the riot of extremes in feeling, the propensity to effect, the dazzling, purely technical playing, as well as indolence. But they have blood and nerves, a burning enthusiasm for all that is beautiful and great, a tendency toward the dramatic, pathetic and heroic, and inimitable elegance and ease of touch and of bowing.

In most of them, to be sure, are generations of Jewish blood. The pure Hungarian is a doubtful quantity. But mixed or not mixed, the race itself, together with the Bohemian and Slavic, always provides excellent material for the art of the violin and 'cello, and richly predisposed piano-players, especially when there has been intermarriage with German discipline and thoroughness, German comprehension and taste.

The Imperial German (so-called) is plainly inferior to his Austrian race-brother in playing gift, especially with reference to blood, musical nerves, rhythm, charm and technical ease. The Elbe and the Main are not mere geographical boundaries. The Austrians, like the Hungarians, are sheer, full-blooded musicians, and the predisposition, the lighter temperament and the higher musical potentiality are as golden weights, which weigh heavier than the thorough training and cultivation of the North German. The gay nature, the joy in singing and in playing, and the unreserved personality of the Austrian, are not to be caught by imitation. They are advantages of ancestry, which, like the climate (one has only to recall the sun of Italy and its influence on the human singing voice) belong more naturally to the cheery South than to the colder and severer North. (Note.—The string band of the Vienna Philharmonic is without an equal. The North German, however, has the better "brass", while the French, as is well known, produce the best players on the wood-winds.

Strength of character, strict discipline, energy, endurance and industry; solidity and thoroughness of workmanship; in a word, better "schooling," these qualities for which the German "of the Empire" is known, are often a disadvantage to his art. House and school in Germany destroy more than kind Providence can be responsible for. The schoolmaster in the German, that which makes him "Professor," shuts the light and sunshine out of his music. Besides the reserved and imprisoned personality, besides the playing-will which is attained only through training, and besides the lack of confidence, there is a still greater hindrance—unwieldiness and slow motor-activity, "the long lead," as the Berliner jestingly says. Impulses seem to become slower in proportion to the northern degree of latitude. The bony structure is stronger, the physical power increases, but the transmission and translation of the central impulse takes longer, and the manual dexterity and skill, the ease and fluency of technic—in short, the elastic tension of muscles and joints, is decidedly inferior.

German Pianists of Foreign Descent

The great playing-talents of Germany are mostly of foreign descent—are Jewish or Slavic mixtures—Russian, Pole, Hungarian, Bohemian or Romanic.

If one looks closely at the various stems, the Thuringian, Rhenish and Saxon elements of the former Empire are the most gifted, the most joyous in playing. The Thuringian forest is enriched with the blood of the old Franks. And in the Thirty Years' War, Slovak, Croatian and Hungarian were brought thither. The Counter Reformation brought Bohemian, Salzburger and Tyrolese (Innsbrücker) over the old Roman Road and with them, the art of the glass-blower, and musical blood.

The Saxons of the former kingdom are not of pure Folk origin. The population is a mixture of Thuringian, Frank, Wend and Czech. But this mixed blood is of a mobile spirit, alert and swift, quick to observe and comprehend, and skilful in all manual arts and accomplishments.

In the Rhinelander, music is in his blood just so long as Father Rhine rolls his waters through this Paradise on earth. The joyful nature, the pleasure in wine and song, of the whole race, create a type there, which closely approaches the Austrian type, in musicianship and technical fitness. At all events, the playing art is an art of adroitness, of light, fine, graceful wrists, on the banks of the Rhine, where grows the flower of charm, and where rhythm can unleash itself freely in the swinging dance—more at home than in the land of the Pomeranian grenadiers, or on the shores of Northern waters.

Transitory mixtures with Romanic-French blood are there, also helpful to the playing arts.

Among the South Germans, Suabia, Pfalz and German Elsass are prominent in musical feeling, although here the technical ability is considerably inferior. A certain good nature and thoughtful contemplation, which belongs to these races—except in certain more cheerful districts of fields and woods—are not favorable to the growth of the playing art. This is also true of the Alemannian Swiss, who have seldom become world-famous in the interpretative arts. The French and Welsh combination is better.

In Bavaria we touch upon heavier ground. The whole style of the man is heavier, limbs are more stiff, and skill in moving them is less. The same is true of the northern branch of the old Saxons (in Braunschweig Hanover and the rest), and Westphalia, Pomerania, Mecklenburg and Friesian East and West Prussia. With them, too, the love of music is not at all in proportion to the executive skill. The projection of rhythmic impulse seems to be checked; technical ease is rarely found in combination with inborn charm.

Virtuosity—as it appears in a gesticulating, rhythmically agile race, is here almost a mythical idea. Where the bones are heavy, the elastic wrist is rarely found. Musical feeling, slumbering in the depths, is often crushed by the heaviness of mind and body, stifled by the gloom and anxiety of the northern woods and seas, in the fog and ice of the long winter. Only occasionally does a shoot rise to sunny heights, and offer to the world, in playing and in technic, the wonder of a lightly swinging rhythm.

---

[1] Compare also their amazing adaptability in theatre and operetta. Even the soubrette of the opera is usually of Jewish extraction. In the world of artists, among the jugglers and tight-rope performers and acrobats, the same holds true.

Scandinavian Pianists

The other Northerners, especially the Norwegians, are hemmed in by the same limitations of race. They depend for their interpretative art, almost wholly on importations.

Danes and Swedes are more mobile, the latter especially, with their mixture of Finnish, German or Romanic blood.

Good talents are found also in the German Baltic provinces, Laton and Finland.

The same statement holds true for Holland. The number of playing talents in no way corresponds to the sound, musical feeling of the people, and the good musical training in home and school. The renowned great violinists, 'cellists and pianists have, moreover, strains of Jewish or Semitic blood.

Of the pure Romanic races, the French are unquestionably in the lead. Intellectual and technical facility, grace and eloquence, are virtues which cannot be denied the French, and for long years they have conduced to the great reputation of French violin schools, of Brussels and Paris, and the piano methods of the conservatoires.

Italy, the Paradise of voice-culture, has for a long time accomplished more with violin technic than with piano technic. But recent times seem to have brought about a change, and to have increased piano talent.

The same may be said of Spain and Portugal. Yet in all three countries mixtures of Jewish and German origin are not rare, and, when they appear are usually of remarkable gifts.

English and American Pianists

The Englishman of the original stock seems to have been forsaken by muses and graces, since the decline of his Elizabethan period of flowering. His irresistible inclination toward football, boxing and water sports, inevitably precludes activity in the province of interpretative music.

The best branches are found in the Welsh race of the old Cymric Wales, and in Norman mixture. Irish and Scotch are truly gifted. Both stems produce excellent violinists, occasionally also good piano-players.

Of North America one may say, as of a vineyard, that there are localities and waves good, bad and indifferent.

The pure New Jersey man shares the fate of the pure Englishman. This branch gives only sour wine.

The best species grow in the South—Virginia, Carolina, Alabama and Florida, and in the Western States—Texas, Kansas, California. Here, where Spanish, French, German blood is richly and variously mixed with English, striking talents are born. Also in the Middle and Northern States, where are Irish, Polish, Czech, Hungarian and Italian mixtures, with or without the Jewish strain, good material is found.

In Canada there are French and Scotch graftings.

The whole complex of the States, with its vivid mixture of peoples, needs only good schools and the Old World tradition and cultivation, to achieve perfection. But the day is not far distant, when this land of technic (which, moreover, can afford the luxury of the best European artists) will make itself entirely independent of foreign importations, and when its own art centers and schools will bring forth material quite equal to that of the old mother countries—if not even better material.

Here are great activity in all that is technical and practical, a true sense for all that is new, which saves time and labor. Here are a keen sense for the best methods and practices of the world, imitation and quick adaptation of all the results of modern research in all the departments of art-technic; here excellent bodily training and development at home and in the school, in which the idea of modern relaxation, the rhythm of free movement, the culture of the dance and the freedom and lack of reserve in personality which already are more widely known and more popular than in the Old World. Thanks to all these qualities, a soil is prepared in which the young plants may develop, grow and thrive with uncanny swiftness.

In Central America, Mexico plays the chief rôle. Her best talents are cultivated in France and Germany. In South America, the preponderating influences are the mixtures of the mother countries—Spain and Portugal. Brazil and Argentina, Venezuela and Chile are rich, new soil, which will bestow many musical blossoms upon us. The musical development, in comparison with the giant strides of the United States, is remarkably backward. The larger proportion of mixture in the blood, as well as the climatic conditions of the tropical zone, have diminished the executive power of the race, even into the present period. The best specimens and examples have sprung from French and German schools.

Australia, on the contrary, has great aspirations, and in certain manifestations has far outstripped the mother land, England, The daughter colony has produced not only phenomenal voices, but also several instrumentalists of high rank and reputation.

Quite in the background appears the yellow Japanese, in musical art still fragmentary, without visible development, without musical sympathy or taste. But who knows whether he may not yet outrank the old, rotten Europe? The downfall of the "Lands of the Evening" is perhaps nearer than one suspects, and the flowering of Japanese painting and relief shows that powers are slumbering in the yellow races, which, if they are once awakened, may promise equally great musical art, both creative and interpretative.

Jewish Pianists

The following names show what a high percentage, of talent, especially in the virtuoso art, is derived from the Jewish race. Of pure or mixed Jewish descent are (the names show which are to be reckoned as belonging to the ancient race) :—Henri and Jaques Herz, Henri Rosellen, Josef Ascher, Wilhelm Goldner, Sigismund Thalberg (Paris), Ignaz Moscheles, Felix Mendelssohn, Jakob Blumenthal, Felix Blumenfeld (Petersburg), Karl Tausig, Anton and Nikolaus Rubinstein (both Russian Jews), Alexander Dreyschock (Czech), Julius Epstein. Theodor Leschetizky (Vienna), Arthur Friedheim, (Russian), Moritz Moszkowski (Polish Jew), Xaver Scharwenka (German-Pole), Raphael Joseffy (Hungarian Jew), Emil Sauer, Moritz Rosenthal, Alfred Grunfeld (Vienna), Alfred Reisenauer, Ferrucio Busoni (Italian, with Russian-Jewish mother), Frederic Lamond (Scotch), Leopold Godowsky (Russian) Vianna da Motta (Portugese), Mark Hambourg (South Russia), Ossip Gabrilowitsch (Russia), Karl Friedberg, Ignaz Friedman (Pole), Gottfried Galston (Hungarian-Polish stock), Arthur Schnabel, Paul Goldschmidt, Leonid Kreutzer, Joseph Lhévinne (South Russia), Severin Eisenberg (Pole), Bruno Eisner, Ignaz Tiegermann (Pole), Alexander Borowski (Russian Jew), and others.

Of pure German blood are Hans von Bulow, Karl Klindworth (Hanoverian) Klara Schumann, Bernhard Stavenhagen, Konrad Ansorge (German—Moravian), Heinrich Barth, Max Reger, Max Pauer, Josef Pembaur (Innsbruck), Frida Kwast-Hodapp, Waldemar Lutschg, Wilhelm Bachaus (Leipzig), Elly Ney (Rhineland), Edwin Fischer (Swiss), and others.

Liszt was pure Hungarian, so also are Ernst von Dohnányi and Franz v. Vecsey. Joseph Joachim was, as has been said, Jewish. Chopin was pure Polish. Ignaz Paderewski is likewise Polish; Joseph Hofmann, German-Russian, Teresa Carreño was in blood, pure Spanish, and Claudio Arrau also. A like high proportion of Jewish blood could also be shown among singers, violinists, 'cellists and conductors.

If one glances into the history of *creative* music, the proportion is found to be just the reverse. At all events, here the Jews are in the minority, even though they have, at all times, dominated in the lighter musical forms, such as operetta and the popular music—so called. Creative geniuses like Halévy, Mendelssohn, Meyerbeer, will, remain exceptional, at all events, so long as the Jewish race does not feel the inner necessity for ethical art-power, the call to ideal heights, to mystical glorification, the painful struggle to comprehend the World-Soul and the eternal mystery of God; the deepening of technic in the direction of great form, inner structure, and contrapuntal working-out.

Mahler

"The case of Mahler" proves this: He was first, Faust-like, Jew who sought to break loose from this inner race dissension, and to reconcile the discrepancy between logical speculation and intuitive power. At all events, he struggled, fanatically with himself, God and the world, and wrought out the solution of the great musical synthesis with an unparalleled mental energy. Mahler possessed cosmic feeling and a magical imagination (Lied von der Erde), in spite of superficial and banal moments.

Likewise, the youngest, most Jewish of the Expressionists (Schönberg and others) exercise a powerful charm in the heedlessness with which they let loose the world of tones in all its finest colors and shadings, as if attempting to break it into quarter tones, like a magic spectrum. But thus far, their efforts and labors are only feeling the way, and seeking for beginnings. The speculative preponderates. The "Soul-Dynamic" is lacking; the mighty proportions of height, depth and breadth; That which is reckoned out, subtilized, broken into many harmonic colors does not suffice; for the roots of all great creations lie on the other side of space, limits, color and count. Without symbolism of world-feeling, without mystical experience, without seeing of visions and seeking to realize dreams, the heartbeats of man will not be quickened.

Why a Contest

By Genevieve Sowers

"All life is a race," said Benjamin Disraeli. Nothing in human life excites quite so much interest as a race, whether it is a contest to decide the prowess of pugilists, tennis players, chess wizards or the greater battle of nations.

Millions are spent each year in races for supremacy. Unfortunately these millions are given largely for trials of brute force. But the contest principle, the race is the same.

Nothing stimulates interest among children of the same grade quite so much as contests.

Appoint a specified time when a certain piece or study shall be learned. Have these pupils meet at your studio and each one play in turn. Award a prize to the one who plays best from a musical standpoint. The idea of securing a prize will keep up their interest while preparing for the contest.

Any study or piece which contains good technical material and is pleasing to the pupils will answer. The following are very good: Clementi, *Sonatina, Op. 36, No. 1; Austrian Song,* Pacher; *Solfeggietto* Bach; any Sonata, Chopin Waltz or Song Transcription within the ability of the player. Bach Inventions, Studies of Czerny, Clementi or Cramer may be used.

When the class begins the study of the desired composition, have it understood that it shall be judged according to the following points: Tone, accuracy, rhythm, phrasing, pedaling and speed.

"Artists succeed because of their ability to project their personality beyond the limits of the stage. For this an endless supply of vitality is required, and without this life-giving stream all talent is sterile."

Why She Made a Success of Teaching

By S. E. Spratt

"I need not fear to trust my child to her;
I knew it by the lighting of her eyes,
When first she stooped to take his hand
in hers,
And speak a word of greeting."
—Craig.

(1) Because she made a study of child nature as well as of music.

(2) Because she was a student of her work.

(3) Because she selected books and pieces best suited to the needs of her pupils.

(4) Because she traded with a music house that always could supply her needs promptly.

(5) Because she read good musical magazines, attended teachers' meetings, lectures and recitals.

(6) Because her word could be depended upon.

(7) Because she did not "bluff" nor make excuses if she committed an error.

(8) Because she did not hold up certain pupils as examples to others.

(9) Because she never concerned herself about the family affairs of her patrons.

(10) Because she never attempted to teach pieces beyond her own ability.

Arpeggio Fingering

By Celia F. Smith

In playing arpeggios in the third form, pupils often have difficulty in finding the correct fingering when the arpeggio begins on a black key. A good rule to remember is that in the right hand the thumb comes on the first white key ascending, and the left thumb comes on the first white key descending. For example:—in the arpeggio "bb-d-f" the right thumb comes on "d" and the left thumb on "f."

A Thousand Years From Now. Music in America in 2924

A Mid-Summer-Night's Phantasy

By LORNA GILL WALSH

"ORDER the Aero Car, Minerva; let's take a little trip," said Mars.

"We need to do some propaganda work; my shield is getting so rusty."

"Where shall it be, Min?"

"What a question, Mars. America, of course! they have such good brass bands."

"I am just sick of her Radio messages of Peace and Good Will, with pretty hymn-like accompaniment," said Mars, "but I'll be blowed if I'll send her a Christmas card."

Landing at the Hangar, off Montauk Point, Tory Island.

Emigration Officer: "What brought you here, Mars? and Min, too? Surely you did not think we'd let you in? What's that I see in your grip? A drum and a trumpet? Ha! ha! Don't you know that for more than fifty years we've not allowed any one to own or play these instruments without a license?"

(Mars bribes him with a bottle of Ambrosia.)

"I tell you what I'll do, Mars; but first I must confiscate that drum and trumpet. Naturally you're interested in seeing a bit of the country, I'll show you about town, incognito, of course; you'd be electrocuted at once, if you were caught.

"We call this the Age of Harmony, because all the effort and accomplishment for the past century have been along these lines. After all the hatreds of that last war something had to be done. Right here in my department I shall show you what is being accomplished." (Mars could see a baton waving in the distance.) "We begin to harmonize these alien groups at once—it keeps them waiting peacefully. Such terrible fights history tells about between those Hungarians and Roumanians, Italians and Austrians, not to mention the awful rows between the English and the Irish. The Melting Pot was a great failure, until those Musical Efficiency fellows got busy.

"The physical examinations over, all immigrants are passed to the Musical Experts, their ears and voices tried and indexed, then assigned for chorus work, here, and the Community Houses in their future neighborhoods, in town or country. Players of instruments are ticketed for Community Orchestras, their services to be called upon, for Municipal, State, patriotic and charitable affairs.

"'Vibrating in unison with nature,' is the slogan of the day. The application of music, in industry, medicine, in every department of life, has done wonders. Let me call one of our Musical Experts; he can tell you better than I."

(Introducing them as friends from Newfoundland.)

Musical Expert.—From the Department of Musical Efficiency:

"I shall be delighted to show you something of the workings of our Musical System."

All go off together.

"Here's a factory, where a new musical apparatus has been installed. A short time ago the manager, seeing failure ahead, called upon me for advice. I said to him, 'no wonder; those old tunes of yours won't work any more, they're out of date. What you need is an entirely new musical mechanism. You must be progressive, up to date in your musical system.'

"Now, as you see, business is flourishing. Harmony makes the wheels go round; musically well-fed workers put their hearts into their work. I press this button for Tonic Tunes, for tired workers; out pours, *Tarentellas, Scherzos, Jigs* and *Reels*—all the Step Lively Tunes; no Hesitating Waltzes, mind you. An ether is scattered through the air that fills them with happiness and contentment. The Boss tells me that now they ask him to work overtime. He has to force them to leave when the whistle blows for luncheon. That's the result of good, wholesome drinking at the pure fountain of melody, a pure sparkling drink, with no 'morning after.' We Musical Experts recommend more lilting music and less hootch. Turn on the spigots of harmony (pointing to the various buttons) and they spring to their tasks as though they were going to a baseball game.

"In every department of life and industry, you will find it the same—our Department of Musical Efficiency working successfully to relieve most of life's drudgeries and burdens. But I don't suppose any Age ever was or ever will be perfect, let alone this Age of Harmony. There are Clothing and Shoe salesmen, who will demand your favorite tune, then sell you a suit of clothes or a pair of shoes, a size too small. Getting one's keynote, instead of one's number, is working untold mischief in all lines of business. The mesmerism of music is a dangerous power in unscrupulous hands. Look at some of those Real Estate Developers who go out into the country, with fine bands along, to auction off worthless tracts of land! Look in the newspapers at all the ads. for Musical Directors and Musical Aids of every sort; if you wish to know what is thought of the powers of music." "All the ads. were for servant girls," said Min to Mars, "when I was here before."

"With the Doctors it was formerly pills and pulses, or tongue and tonsils. Now there are more musical prescriptions than were ever in his pharmacopoeia. But you should see the vim the Docs. go to it; all the appendices, the tonsils they clean up in a day under the influence of the Heavenly Maid! She really warms up a man's whole nature with a spirit of generosity, too, (attention charity workers!) toward his fellow man. He forgets his grudges and his hatreds."

Suppose that, Rip van Winkle-like, you went to sleep for a thousand years and woke up in the world ten centuries hence. What would music be like then? Miss Lorna Gill Walsh, one of the most imaginative writers in music, and a practical musician herself, essays a picture of music in 2924 that our readers will surely find interesting.

Mars was dying to ask him what the salaries were in his department, but it was difficult to find a pause in the ceaseless flow of conversation. A stop for breath gave him his chance at last.

"The salaries are big," he answered. "Why not?" with a broad wave of his hand. "It requires the profoundest knowledge; years of study, from the physical, scientific, emotional and aesthetic standpoints. Courses of Applied Music are given now, in all the Universities.

"But as I said before, music has its abuses. The Antis are always with us, terrible fanatics, who see only the bad side of everything. They wish to abolish all music, as those Prohibition cranks of a hundred years ago, who succeeded in banishing all the beautiful sparkling wines, and those distilled essences of flowers, the chartreuses, because some people imbibed too many spirits. They have yet to learn, as the Prohibitionists, the difference between the wine and the spirits of music. It's the invention of the devil, they say, because of the stimulating effect of our highly emotional music. I admit its dangers, it's a force like electricity, that must be kept under control. It can bring out the best and the worst in us. But already we have harnessed its powers for the good and the happiness of mankind; already, we have our musical censors. No wonder that great old novelist, Count Tolstoi, was afraid of it! There are operas and Symphonic Poems that fire the blood like cognac. They're not meant for daily use, as are the health-giving wines of simple melody and harmony.

"Just think of its benefits to the sick, alone! Our Musical Healers are God's own people. They must be very clever musicians who can sing or play some instrument. They are familiar with all the sources of musical supplies, and well read in the vast library of recorded music. They can conjure up all the powers of auto-suggestion; they can bring peace and calm with old church music, or can quicken the pulse of the depressed and make one live again in pleasing memories of the past."

The Emigration Officer caught a glimpse of Mars trying to suppress a yawn; and Min, usually so talkative, hadn't a word to say for herself. "Come, let me take you to my apartment for a cup of tea; you must be tired," he said.

"Tea," whispered Mars, with scorn to Min. "I'm scalded with tea. What we need is a good bracer, after all this." (Officer escorts them to his Aero Sedan.)

(Arriving.)

"Now that we have Aero Cars at our doors we have become a nation of homebodies. Make yourself comfortable, Min," as he stuffed a cushion behind her back, and offered her a cup of tea. "Two pieces of sugar? A little rum?" (Mars helped himself, generously, as soon as the Officer's back was turned.)

The Musical Expert: "I shall let you hear that new opera they're playing at Monte Carlo this afternoon. Operator, give me *The Fall of Constantine of Greece.*

"This evening you can hear that fine new tenor at La Scala, some of the new popular music from Vienna, and some of our native opera at the Metropolitan. Oh! You would prefer to hear some of the old operas and singers? All right, here, press these buttons for your recorded music. This wealth of music in the home is chiefly responsible for what America is to-day—the most musical country in the world. It's because of the opportunities for repeated hearings of the great masterpieces of music by the great artists and orchestras.

"Very nice on Sunday mornings, Mars, if you're spiritually inclined," whispered the Emigration Officer. "You can have your Gregorian Chant and your favorite preacher served with your toast and coffee, without the irritation of a collection box."

"What above all those lovely prima donnas you had at the Metropolitan?" said Mars. "Some without much voice, either. And those managers and millionaires?"

"All that's changed," interrupted the Officer; "a matter of history. The public do the picking, now. The successful manager keeps his finger on that musical pulse of the people, Radio. The day of advertising and press notices is over. There is nothing to influence public opinion in advance. American ears have grown so keen and critical that no manager can slip anything over these days. Reputations are made overnight. New singers, unheralded and unknown, wake up to find themselves famous as Carusos or Jeritzas. Success by Radio signifies a great demand for names of the performers so that they may be heard in person, in concert or opera, with the managers waiting to offer them the opportunities their talents and the public appeal calls forth."

"Those Wagner operas were terribly longwinded affairs," mused Min.

"Not now," replied the Expert. "They were like some good old apple trees that need a good deal of pruning. Few operas last over half an hour now; rarely an hour or an hour and a half."

"You don't mean to tell me that people sit at home every night listening to music?" said Mars, aside to the Emigration Officer. "They were chasing out every night to the movies, or jazzing it somewhere, when I was here before."

"You mean the People's Theaters? They're still very popular."

"I did have quite a weakness for those fine cowboys, and I just loved the little vamps," Mars ranted on.

"You'd scarcely know them from a real theater now, pictures have grown so realistic in voice and action; besides, there are reproductions of musical comedies, old and new, plays and music, the mimic drama as well as the spoken drama, and opera nights, when both new and old works are given. You see, these theaters have very elaborate mechanism, too costly for the average home; but you'll find the same old heartbreaks and misunderstandings as before, plenty of bashful suitors, and heroines enfolded in the arms of their lost sweethearts at the finish."

"The Musical Expert says he would like to show you one of our studios," said the Officer.

"No; tell him I would rather sit here by the fire. So pretty girls are still carrying music rolls about, and really take the trouble to practice five-finger exercises, with all this canned music?"

"It has just the opposite effect," said the Expert. "Teachers never were so busy. It has stimulated only more the desire for self-expression. Nothing can take the place of that. Teachers are people of great importance in the community, not like the past century, when hod-carriers earned more. Not every one who has the ability to pass the State Board of Musical Examiners. Studios have great libraries of recorded music, the interpretations of the artists of the past century and the present, as well as the interpretations of their own works by famous composers of the past century. Sheet music always was a feeble means of expressing their musical ideas. Tradition had to be more or less relied upon. So much material along these lines of interpretation has accumulated that it has given rise to a School of the Technic of Emotional Expression.

"I shall take you to a concert this evening to show you the error of your opinion in regard to the effects of our musical machinery." (Mars uttered a groan.)

"Better accept," whispered the Emigration Officer, "he might get suspicious."

Evening at the concert, Olympus Hall. (Mars looks around.)

"Well, Min, I never thought I should see this day. Just look at all the men! And not one asleep! Not even a snore! Little did I think those brave American men would ever come to this!"

"The old mollycoddles!" retorted Minerva. "The women are to blame for all this! They've dragged them around to concerts and operas for years until now they've grown to like them."

"What's this they're all listening to?" Mars said, glancing at his program.

"The World We Live In." (Symphony of color and sound), by Seraphimsky.

"Let's go, Min; sneak out while it's dark. I'm just sick of it all."

"Hush! Stop rattling that sword! The time has come for a little diplomacy, Mars. Just wait a minute. I would like to take home some good spicy gossip about these melomaniacs and this music."

"Music, woman, there's not a tune in the whole darn thing!" (Intermission after the Symphonic Poem.)

"Pardon me, my friend, but I overheard you," said the Expert. "Sorry you're not enjoying it; but you will if you stay with us; your ears, perhaps are not so sophisticated as ours in your Newfoundland. The fact is, a single tune is too obvious a thing for the cultured ears of Americans. We must have a rich tapestry of melodic design, a rich warp of melody and harmony, as in this symphony with its vivid characterizations of the animal and the man-made world, the world of roaring machinery, —and the world of nature, with its mists, its twilights and its moonlights. And then all that infinite melody of color. Heard melodies are sweet; but, perhaps, those unheard are sweeter.

"There is a psychology in it all, too. It's music with a purpose, made to unite us. Don't you feel that you want to make up for all the suffering you have caused in the world? Doesn't it make you love everybody when you listen to it? Makes one feel so mean to have been jealous of any one—for me to have been envious of that other fellow down at the department. That's how wars arise! There is no greater power on earth to make men brothers. It creates pity and love and faith.

"The great composer of to-day is a profound student of the psychology of music. This great school of composition of the past fifty years has arisen because of the discovery of the laws of vibration underlying the powers of suggestion in music. Why, music can form one's thought and mood, it can make us live within ourselves, and lift us above the petty cares of this life. Great music is a psychical storm, agitating to fathomless depths the mystery of the past within us. Why, there are tones that call up all the ghosts of passion, of joy, of tenderness, of pain and perished passion! To every ripple of melody and billow of harmony there arises out of the past some eddy of pleasure and pain. If the discovery of the laws of harmony produced great masters like Haydn, Mozart, Beethoven and Wagner, look at the giants of to-day that the knowledge of these laws of musical psychology have given us!"

The Fascinating March

By C. A. Browne

"Why," challenged the maiden fair, "Why do I like Military Marches so much better than any other kind of music?"

The man whose Military Marches have girdled this globe of ours replied, "It is because of the barbarian, the savage, the Oriental, in you." And in evidence, he smilingly pointed out the feathers in her hat, the skins of the animals with which her dress was trimmed, and the little, ornamental tassels that bedecked her slippers.

"A March must be robust," argues the March King. "It must stir the blood. No matter how cultured we may be, we all have in us an element of the wilds."

From the primitive savage, lustily beating upon his tom-tom, to inspire fierce deeds of courage in his fellow-tribesmen, 'tis a far cry to our glorious drum-major, gracefully and ostentatiously twirling his wand at the head of a glittering band of instruments.

Along the mighty rivers of the Dark Continent, the negro tribes code all sorts of messages, to those dwelling on the opposite side of the stream, by beating the rhythms of their tunes, upon their clumsy drums. And the seven-foot war trumpets of New Zealand's Maoris could be heard for miles.

Napoleon—most practical of men—convinced of the stimulating effect of Music upon armies, utilized it with telling results little recking of a time when that of the enemy should contribute to one of his most humiliating defeats. The advance of his Grand Army into Russia was undoubtedly the turning-point in Napoleon's career. It marked the beginning of his downfall. In his note-book we find this significant entry: "The weird and barbaric tunes of those beastly Cossack regiments simply infuriated the half-starved Muscovites to the maddest rage. And they wiped out the very cream of the army." The Man of Destiny, in summing up the causes of his overthrow, frankly added the effects of the singular Russian music to the rigors of a frightful Russian winter.

A book, written in 1622, intimates that military musicians were esteemed as almost sacred some three hundred years ago. The drummer, especially, was to be considered as a man of peace, rather than of the sword. It was considered most dishonorable for anyone to harm him.

Old-time military instructions direct that "It is to the voice of the Drum that the soldier should wholly attend." In modern Music three separate Drums are used. And Military Music employs three different cadences, the Drum being of the utmost importance in defining the distinct rhythms.

Naturally, the pace varies with the composition; from the extremely slow time of the Funeral, Processional or Dead March, gauged at 75 steps a minute; the Quickstep, calling for about 103 steps; to the Pas de charge or Double-quick, demanding 120 steps. In the first two rhythms, a pace or step means a stride of 30 inches; whereas in double-quick time it denotes 36 inches.

Said Handel to Gluck, "If you want to work for the English, you must give them something tumultuous, like the rattle of drum-sticks or a drum." But this biting comment should have included the entire race, rather than a fraction of it. Even primitive man so marvelled at the sound of a drum that he believed it to be the voice of a spirit.

Later, the brilliant Marshal de Saxe protests that the sound of the Drum is more than mere noise; that the entire military art depends upon its various cadences. Always, and irresistibly, has the Voice of the Drum called to the soul of Man, as well as to the subconscious savage that is latent within him.

Rubinstein's Free Seat

Rubinstein was constantly importuned for free seats for his recitals, by people who were willing to resort to all kinds of means except currency to secure them. One young lady was unforgivably persistent.

"But, master," she said, "you surely can get me at least one seat."

"There is only one empty seat in the house," responded Rubinstein, "and I will give you a pass for that."

The young lady was delighted, but upon reaching home found that Rubinstein had written, "Good for the seat at the keyboard."

"The minor mode is so universal in folk songs because life among the common people, almost the whole world over, was full of sorrow and oppression, and this found its vent in the wailing minor."

—Louis C. Elson.

Traffic and Genius

By Jacob L. Geiger

Has the age in which genius was respected by the common people passed away? Here is a tale of Beethoven, authorized in a recent German publication. Beethoven was accustomed to take paper and pencil with him on his daily walks around Vienna. Whenever the inspiration seized him he would stop to write down new ideas. Once he stopped in the middle of a street, sat down and commenced to write out his themes. Two cabbage pedlars from the country came down the street with their loads of cabbages. One was about to shout to the composer to get out of the way when the other, recognizing Beethoven, exclaimed, "Ha! Hans, leave him alone. He is the greatest musician in the world. Our cabbages can wait for his ideas." So they patiently waited until Beethoven was finished. How would Beethoven have fared with an American traffic "cop" if he had held up the traffic in similar manner. Perhaps we shall never have great American music until we learn to make allowances for genius.

When Beethoven Was Arrested as a Tramp

By William G. Dentzel

Very few people know that Beethoven was actually arrested as a tramp. It occurred in this way. The master went out for a short walk and became so enraptured with some new themes that he was developing mentally that he lost all idea of time, place or personality. He walked along a canal and finally found himself in the outskirts of Vienna, in a place known as Wiener-Neustadt. He lost his bearings entirely and had no idea where he was. When he awoke from his musical trance he was covered with dust from head to foot, hatless, his hair disheveled, his face streaked with dirt and perspiration and his house-coat old and soiled. Small wonder that when he sought to find his way and shouted, "I am Beethoven," no one believed him. Only when the police took him in hand and led him back to his quarters would the people of the streets really believe that this tramp was the great Beethoven.

Where Are You Going?

By W. F. Gates

On the street recently, we heard the following conversation:

"Hello, John," said one young man to another: "Where are you going?"

"I don't know where I'm a-goin'" was the spiritless reply.

It struck us that this answer expressed the condition of many music students. They don't know where they are going, or why.

They begin music study because their parents demand it. They keep at their lessons because they don't know how to get out of them—or all of them.

The technical studies are bores, and so they skim over them a few times, and then make noises to "make mother think I am practicing." They can see no use in the study of sonatas, those "dry old things," and so far as Beethoven is concerned, there might as well have been a hyphen in the place of the "h" in his name.

They do not acquire the technic to play the better class of moderns and so drift off into the parlor-piece class. Neither do they take as much interest in this as in the jazz orchestra at a cheap theater.

Musically speaking, they "don't know where they are goin'!"

More than that, if you ask us, we do not think they are "goin'" at all. They are stationary.

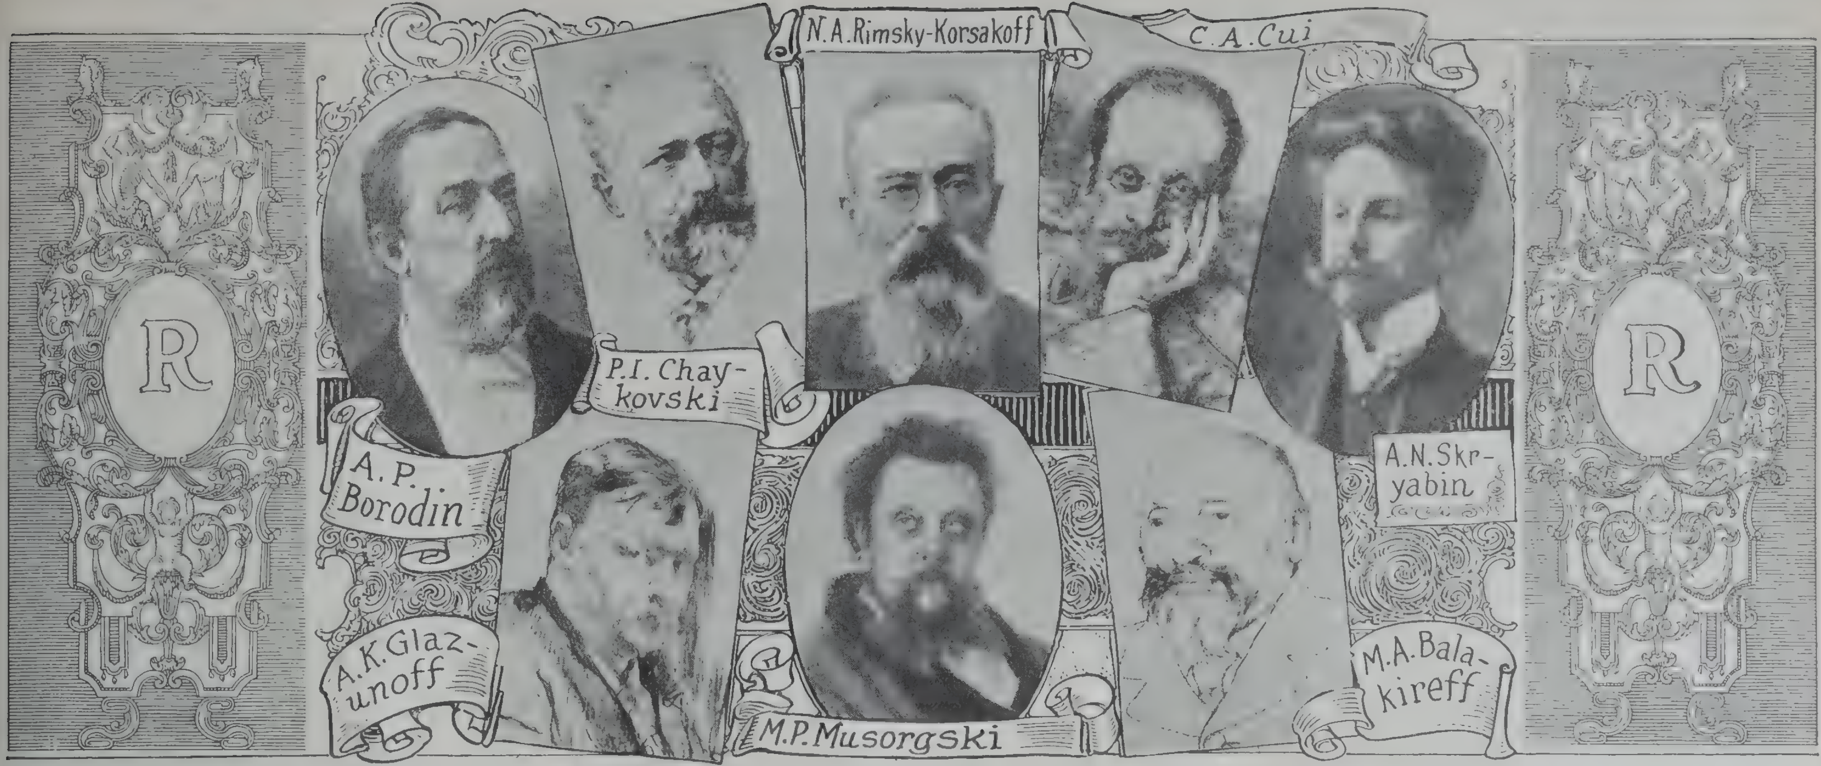
"We often find out what will do, by finding out what will not do; and probably he who never made a mistake never made a discovery."—Samuel Smiles.

A Blind Composer Before Braille's Invention

An interesting chapter in the life of Fridzeri has not found its way into the musical encyclopedias. Blind though he was, in the years 1772 and 1776 he wrote two small operas.

In the "Correspondence Litteraire" of Baron Grimm and Diderot we get some light on his method of work.

On a desk silk threads were stretched to form the musical staffs. Little wooden figures were cut to represent the notes and other characters to be used. Each kind was kept in a little drawer to itself; and he accustomed himself to recognizing them by his touch. Thus he wrote music much as another would set type; and, to prove his writing, he had but to pass his fingers over the wooden figures.



The Music Masters of Modern Russia

Intimate Glimpses from the Autobiography of

NIKOLAY ANDREYVICH RIMSKY-KORSAKOFF

One of the Most Significant of Modern Musical Life Stories

Editorial

[THE ETUDE herewith presents several graphic extracts from the autobiography of one of the greatest of Russian masters, Rimsky-Korsakoff, as translated by Judah A. Joffe and edited by Carl Van Vechten. These extracts have been taken from the 389-page, finely illustrated volume, by permission of the publisher, Alfred A. Knopf, Inc. Few biographies in the field of music have been written with the minute attention to veracity and frank expression of opinion as this detailed and interesting work of the composer of "Le Coq d'Or."

Rimsky-Korsakoff was born at Tchvin, in the province of Novgorod, March 18th, 1844. He died in Liubensk in 1908. His parents were aristocrats, and although the child was permitted to study the piano at the age of six and actually started to compose at the age of nine, his father and his mother opposed music as a career.

He was therefore sent to the Naval Academy. While there he managed to secure lessons upon the 'cello from Ulrich and upon the piano from Kanille. Balakireff was just then assembling his coterie of young musical enthusiasts upon whom he exerted such a pronounced influence. He gladly took in Rimsky-Korsakoff as a member of the group. The young man after some time in the navy saw that he was destined for a musical career. On a cruise around the world (1862-1865) he visited America. While upon this cruise he wrote his first symphony in E flat minor. This was the first work in this form to be written by a Russian composer, according to some authorities. In 1871 he became professor of musical composition at the Petrograd Conservatory and retained that position until his death, despite the fact that the directorship of the conservatory (as well as that at Moscow) was repeatedly offered to him. Rimsky-Korsakoff wrote fourteen operas, the most famous of which are "The Snow Maiden" and "Le Coq d'Or."

Of his large number of magnificent works for orchestra his symphonic suite, "Scherehazade," is the best known. His chamber music and his songs are less known, with the exception of his "Song of India," which has world-wide popularity. Not the least notable of Rimsky-Korsakoff's life work was the splendid undertaking of reorchestrating and completing the masterpieces of his friends among the less technically skilled Russian masters. If it had not been for the lofty idealism of this man Mussorgsky's "Boris Godunov" (Godounoff), Borodin's "Prince Igor," and Dargomyzhsky's "Kamennoi Gost" might never have been successfully produced. His Practical Treatise on Harmony (printed in Russian and in German) was especially adapted to his own classes. The following extracts have been made without regard to sequence. The translator has made some interesting innovations in converting the Russian spellings into English. Tschaikowsky is, for instance, written Chaykovski and Chaliapine—Shalyapin.]

What the Balakireff Coterie Thought of the "Immortals"

"During November and December, I visited Balakireff every Saturday evening, often meeting there Musorgski and Cui. There also I made the acquaintance of V. V. Stasoff. I remember V. V. Stasoff[1] reading aloud to us passages from the *Odyssey* one Saturday, for the purpose of enlightening my own poor self. Musorgski once read Kookol'nik's "Prince Kholmski," and the painter Myasoyedoff read Gogol's "Viy." Balakireff alone, or four-hands with Musorgski, would play Schumann's symphonies and Beethoven's quartets. Musorgski would sing something from "Ruslan and Lyudmila," (for instance the scene between Farlaf and Nayina) with A. P. Arsenyeff who impersonated Nayina. As far as I recall, Balakireff was then composing a piano concerto, excerpts from which he would play for us. Often he explained to me instrumentation and forms of composition. From him I heard opinions that were entirely new to me. The tastes of the circle leaned towards Glinka, Schumann and Beethoven's last quartet. Eight symphonies of Beethoven found comparatively little favor with the circle. Except for the "A Midsummer Night's Dream" overture, the "Hebriden" overture and the finale of the Octet, they had little respect for Mendelssohn, and Musorgski often called him "Mendel"; Mozart and Haydn were considered out of date and naïve; J. S. Bach was held to be petrified, yes, even a mere musico-mathematical, feelingless and deadly nature, composing like a very machine. Handel was considered a strong nature, but he was mentioned very rarely.

"Chopin was likened by Balakireff to a nervous society lady. The beginning of his Funeral March (B flat minor) roused them to rapture, but the rest was deemed utterly worthless. Some of his mazurkas found favor, but the greater part of his compositions were looked upon as pretty lace-work and no more. Berlioz, whose works they were just beginning to know, was highly esteemed. Liszt was comparatively unknown and was adjudged crippled and perverted from a musical point of view and often even a caricature. Little was said of Wagner. The attitude toward the contemporary Russian composers was as follows: They respected Dargomyzhski for the recitative portions of "Rusalka"; his three orchestral fantasies were considered a mere curiosity (*The Stone Guest* did not exist as yet); his songs *The Paladin* and *Oriental Melody* were highly thought of; but, on the whole, he was not credited with any considerable talent and was treated with a shade of derision. L'voff[2] was deemed a nonentity. Rubinstein had a reputation as a pianist, but was thought to have neither talent nor taste as a composer. Syeroff had not put his hand to his "Judith" at that time, and so was passed over in silence."

Why the Untaught Balakireff Was Such an Astonishing Teacher

"Balakireff who had never had any systematic course in harmony and counterpoint, and had not even superficially applied himself to it, evidently thought such studies quite unnecessary. Thanks to his original talent and pianistic gifts, thanks also to the musical environment which he had found at Ulybysheff's[3] (who had a private orchestra which played Beethoven's symphonies under Balakireff's leadership)—he somehow became at a bound a genuine, practical musician. An excellent pianist, a superior sight reader of music, a splendid improviser, endowed by nature with the sense of correct harmony and part-writing, he possessed a technic, partly native and partly acquired through a vast musical erudition, with the help of an extraordinary memory, keen and retentive, which means so much in steering a critical course in musical literature.

Then, too, he was a marvelous critic, especially a *technical critic.* He instantly felt every technical imperfection or error, he grasped a defect in form—at once. Whenever I, or other young men, later on, played him our essays at composition, he instantly caught all the defects of form, modulation, etc., and forthwith seating himself at the piano, he would improvise and show how the composition in question should be changed exactly as he indicated, and frequently entire passages in other people's compositions became his and not their putative authors' at all. He was obeyed absolutely, for the spell of his personality was tremendous. Young, with marvelously alert fiery eyes, with a handsome beard,—unhesitating, authoritative and straightforward in speech; ready at any moment for beautiful piano improvisation, remembering every music bar familiar to him, instantly learning by heart the compositions played for him, he was bound to exercise a spell as none else could. Though valuing the slightest proof of talent in another, he still could not help feeling his own superiority; nor could that other, too, help but feel it. His influence over those around him was boundless; and resembled some magnetic or mesmeric force."

What Rimsky-Korsakoff Missed

"Of all his pupil-friends I was the youngest, being only seventeen years old. What did I need? A piano technic, the technic of harmony and counterpoint and an idea of musical form. Balakireff should have made me sit down at the piano and learn to play well. That was so easy for him—as I worshipped him and obeyed his advice in everything. But he did not do it; declaring from the outset that I was no pianist, he gave up the whole thing as altogether unnecessary. He should have given me a few lessons in harmony and counterpoint, should have made me write a few fugues and explained the grammar of musical forms to me. He could not do it, as he had not studied it systematically himself, and considered it unnecessary, hence also he did not tell me to study under some one else.

---

[1] Vladimir Vasiliyevich Stasoff, a famous writer on art and music (1824-1906).—CARL VAN VECHTEN.

[2] The composer of what was, before the Revolution, the Russian national anthem, "God Save the Tsar." For L'voff's own account of how it came to be written see Montagu-Nathan's "History of Russian Music" (Scribner's), Page 57. C. V. V.

[3] A music critic, the author of a famous work on Mozart. Balakireff was brought up in Ulybysheff's household. C. V. V.

"Having made me write a symphony after our first meeting, he cut me off from preparatory work and the acquisition of a technic. And I, who did not know the names of all intervals and chords, to whom harmony meant but the far-famed prohibition of parallel octaves and fifths, who had no idea as to what double counterpoint was, nor the meaning of cadence, thesis and antithesis, and period, I set out to compose a symphony. Schumann's 'Manfred' overture and Third Symphony, Glinka's 'Prince Kholmski' and 'Jota Aragonesa' and Balakireff's 'King Lear'—these were the models I followed in writing the symphony; copied (thanks to my powers of observation and imitation.) As for orchestration the perusal of Berlioz's *Traité d'Instrumentation* and of some Glinka scores, gave me a little fragmentary information. I had no idea of trumpets and French horns and would get confused between writing for natural-scale and chromatic-scale instruments. But Balakireff himself had not known these instruments and became acquainted with them only through Berlioz. The bow instruments, too, were an absolute muddle to me; the movements of the bow, the strokes, were completely unknown to me—I indicated interminable legatos, impossible of execution. I had a very vague notion of the execution of double notes and chords, blindly following Berlioz's table, in case of emergency. But Balakireff himself did not know this chapter, having the most confused notion of violin playing and positions. I felt that I was ignorant of many things, but was convinced that Balakireff knew everything in the world, and he cleverly concealed from me and the others the insufficiency of his information. But in orchestral coloring and combination of instruments he was a good practical hand, and his counsels were invaluable to me."

Why Rimsky-Korsakoff Left the Navy

"I was never seasick and never was afraid of the sea and its perils. But, at bottom, I did not like sea-service and had no aptitude for it. I possessed no presence of mind and had no executive ability at all. Subsequently, during the sail abroad, I proved to be utterly unable to give orders in military style, to scold, to swear at people, to speak reprovingly, to punish, to speak to a subordinate in the tone of a superior, etc. All these gifts, indispensable in naval and military service, I utterly lacked. Those were the years of rope-ends and brutal blows on the mouth. On several occasions, willy-nilly, I had to witness the punishment of sailors with 200-300 ratline blows on the bare back, in the presence of the whole crew, and to listen to the chastised man exclaiming in an imploring voice: 'Your Honor, have mercy!'

"On the artillery ship *Prokhor,* when the drunken crew were brought in from shore-leave on Sunday, Lieutenant Dek, standing at the companionway, used to greet each drunken sailor with fist blows on the mouth. Which of the two—the drunken sailor or the lieutenant who hit him on the mouth for the love of it—had more of the beast in him, is not hard to decide, in the lieutenant's favor. Commanders and officers, supervising the tasks, swore with the technic of virtuosi; the choicest billingsgate filled the air with a heavy stench. Some of the officers had a reputation for their fiery imagination and inventive genius in abusive language, others—for their efficiency in knocking out teeth. For this latter exploit great was the fame of first class Captain Boobnoff, who, they said, used to stage a veritable Mamay Massacre[1] aboard his ship while tacking under sail."

Mixing Chemistry With Music

Rimsky-Korsakoff's picture of the amazing manner in which a great Russian chemist gradually metamorphosed himself into a great musician is a classic. The following extract relating to the working methods of the composer of "Prince Igor," is very graphic.

"Borodin was already professor of chemistry at the Medical Academy then, and lived near the Liteyny Bridge in the Academy building. He remained until his death in the same apartment. Borodin liked my symphony, which Balakireff and Musorgski played four-hands. Though he had not finished the first movement of his symphony in E flat major, he already had material for the other movements, which he had composed abroad during the summer. I was delighted with these fragments, having now fully grasped the first movement which had merely astonished me on first hearing. I became a frequent visitor at Borodin's; often staying overnight as well. We discussed music a great deal; he played his projected works and showed me the sketches of the symphony. He was better informed than I on the practical side of orchestration, as he played the 'cello, oboe and flute. Borodin was an exceedingly cordial and cultured man, pleasant and oddly witty to talk with. On visiting him I often found him working in the laboratory which adjoined his apartment. When he sat over his retorts filled with some colorless gas and distilled it by means of a tube from one vessel into another—I used to tell him that he was 'transfusing emptiness into vacancy.' Having finished his work, he would go with me to his apartment, where we began musical operations or conversations, in the midst of which he used to jump up, run back to the laboratory to see whether something had not burned out or boiled over; meanwhile he filled the corridor with incredible sequences from successions of ninths or sevenths. Then he would come back, and we proceeded with the music or the interrupted conversation."

How Rimsky-Korsakoff Played the Piano

"In general, I applied myself that year quite zealously to piano playing, alone in my room. I think I lived then on Tenth Line in a furnished room, at a rental of some ten rubles a month. I diligently conned Czerny's *Tägliche Studien,* played scales in thirds and octaves, studied even Chopin études. These studies were carried on without the knowledge of Balakireff, who never suggested to me work at the piano—though how necessary that was! Balakireff had long given me up as a pianist; usually he played my compositions himself. If occasionally he sat down to play four-hands with me, he would quit playing at my first embarrassment, saying he would rather play it afterwards with Musorgski. In general, he made me feel uncomfortable, and, in his presence, I usually played worse than I really knew how. I shall not thank him for that. I felt that I was making progress in my playing, after all,—working rather hard at home. But I was afraid to play before Balakireff, and he was utterly unaware of my progress; moreover, I was rated 'without capacity for playing' by others as well, especially by Cui. Oh, those were wretched times! The circle often made fun of Borodin and myself for our pianistic achievements, and, therefore, we too, lost faith in ourselves. But in those days I had not yet become wholly disillusioned and was striving to learn things on the sly. It is singular that in my brother's house and at the houses of other people outside of Balakireff's circle, they thought me a good player, used to ask me to play for the ladies and visitors. I played. Many went into ecstacies from lack of understanding. The result was a sort of silly deception."

A Professor Without "Training"

Rimsky-Korsakoff's confessions upon receiving the offer to become professor of composition at the Petrograd Conservatory are most extraordinary.

"Had I ever studied at all, had I possessed a fraction more of knowledge than I actually did, it would have been obvious to me, that I could not and should not accept the proffered appointment, that it was foolish and dishonest of me to become a professor. But I, the author of 'Sadko,' 'Antar,' and 'The Maid of Pskov,' compositions that were coherent and well-sounding, compositions that the public and many musicians approved, I was a dilettante and knew nothing. This I frankly confess and attest before the world. I was young and self-confident; my self-confidence was encouraged by others, and I joined the Conservatory. And yet at the time, I not only could not decently harmonize a chorale, had not written a single counterpoint in my life, but I had hardly any notion of the structure of a fugue; nay, did not even know the names of augmented and diminished intervals, of chords, (except the fundamental triad), of the dominant and chord of the diminished seventh, though I could sing anything at sight and distinguish chords of every sort. The terms 'chord of the sixth' and chord of 'six-four' were unknown to me. In my compositions I had aimed at correctness of part-writing and attained it instinctively and by ear; correctness of the grammar of music I also attained instinctively. Also my ideas of musical forms were vague, especially of rondo forms. I, who had instrumentated my compositions with a good deal of color—had not the requisite information as to the technic of bow instruments, or the real keys (that were used in practice) of French horns, trumpets, and trombones. As to the conductor's art, having never conducted an orchestra, nor even rehearsed a single choral piece, of course, I had no conception of it. And now Azanchevski took it into his head to offer a professorship to a musician so ill-informed, and the musician accepted without blinking."

A Text Book that Was Never Written

"My appointment to the post of Inspector of Music Bands stirred up a desire of long standing in me, to familiarize myself thoroughly with the construction and technique of orchestral instruments. I obtained some of these: a trombone, a clarinet, a flute, etc., and, with the aid of tables existing for that purpose, set out to find out their fingering. At our summer home in Pargolovo I played these instruments, so to speak, for all the neighbors to hear. I had no aptitude for brass instruments; the high notes I produced only with difficulty; to acquire a technic on the wood-winds I lacked patience; yet I became rather thoroughly acquainted with them after all.

"With the peculiar haste of youth and a certain rashness in the matter of self-instruction, I immediately conceived the idea of setting out to write the fullest possible text-book of instrumentation; and, with this end in view, I made various outlines, memoranda and drawings which had reference to a detailed explanation of the technic of the instruments. I was eager to tell the world no less than *all* on this score. The writing of such a manual or rather the outlines of such sketches for it, took a great deal of my time throughout the following season of 1873-4. After having read a little in Tyndall and Helmholtz, I wrote an introduction for my book; in this I endeavored to state the acoustic laws pertaining to the fundamentals of musical instruments. My work was to begin with exhaustive monographs of the instruments by groups, with cuts and tables, with description of all makes in use to date. I had not as yet thought of Part II of my book, which was to treat of combinations of instruments. But soon I realized that I had gone too far. The wood-winds, in particular, proved to include untold multitudes of makes; in reality each maker or each factory has an individual system. By adding an extra valve or key, the maker either adds a new trill on his instrument or makes easier some run that presents difficulties on instruments of other makes.

How Musorgski Went to a Drunkard's Grave

"There was absolutely no possibility of finding one's way through all this maze. In the group of brass wind-instruments I found some with three, four and five valves; the construction of these valves is not always the same on the instruments of the various firms. To describe all this was absolutely beyond my power; and of what use would it be to any one reading my text-book? All these minute descriptions of all possible makes, of their advantages and disadvantages would but thoroughly confuse one who wished to learn something. Naturally, the question arising in his mind would be: Which instrument, then, should I write for? What is possible and what is impracticable? And in the end he would fling my bulky text-book violently to perdition. Such reflections gradually cooled my zeal for my work, and, after struggling a year with it, I gave it up."

"What was the cause of Musorgski's spiritual and mental decay? To a considerable degree it was due at first to the success of 'Boris' (owing to which his pride and ambition as author began to grow); later on it was due to its failure. Presently cuts were made in the opera, the splendid scene 'Near Kromy' was omitted. Some two years later, the Lord knows why, productions of the opera ceased altogether, although it had enjoyed uninterrupted success, and the performances by Pyetroff and, after his death, by F. I. Stravinski,[4] Platonova and Kommissarzhevski had been excellent. There were rumors afloat that the opera had displeased the Imperial family; there was gossip that its subject was unpleasant to the censors; the result was the opera was stricken from repertory.

"On the one hand, V. V. Stasoff's delight in Musorgski's brilliant flashes of creative genius and improvisations had raised Musorgski's self-conceit; on the other hand, the adulation of people incomparably inferior to the author, yet his boon-companions, and the approval on the part of others who admired his virtuosity, though they were unable to distinguish between its true flashes and its felicitous talent for playing pranks,—still pleased and irritated his vanity. Even the bar-man at the restaurant knew 'Boris' and 'Khovanshchina' well-nigh by heart and honored Musorgski's genius. Yet the Russian Musical Society denied him recognition; at the opera he had actually been betrayed, though on the surface he was still being treated with affability. His friends and companions, Borodin, Cui and I, still loved him as before and admired whatever was good in his compositions, but we took critical measure of much else of his. The press, led by Laroche, Rostislav and the rest of them, scolded him continually. Under these circumstances, his craving for cognac and desire to lounge in taverns till the small hours grew stronger day by day. To 'trans-cognac oneself' was a mere nothing to his pals; but, to his morbidly nervous temperament, it was downright poison."

"He was taken to the Land Hospital owing to a fit of delirium tremens. Dr. L. B. Bertenson had placed him there and was attending him. On learning of the misfortune that had befallen Musorgski, we—Borodin, Stasoff, myself and many others—began to visit the patient. He was visited also by my wife and her sister, Mme. A. N. Molas. He was frightfully feeble, had greatly changed and had turned grey. Rejoicing at our visits, he occasionally talked with us altogether normally; yet suddenly he would pass into a mad delirium. Thus things went for some time; at last, at night, March 6th, he died, apparently from paralysis of the heart. His powerful organism proved to have been completely undermined by alcohol."

The Teachers' Round Table

Conducted by PROF. CLARENCE G. HAMILTON, M.A.

This department is designed to help the teacher upon questions pertaining to "How to Teach," "What to Teach," etc., and not technical problems pertaining to Musical Theory, History, etc., all of which properly belong to the Musical Questions Answered department. Full name and address must accompany all inquiries

Encouraging Originality

> How shall one encourage and guard a child's unhampered initiative during the lesson hour,—how constantly and forcefully correct without disturbing confidence and trust?—M. B.

One of the great perils of the teacher is that of becoming too dogmatic. It is so much easier to tell a pupil authoritatively just what to do and what not to do than to fulfil a teacher's real office, which is to guide rather than to lead! Let us learn wisdom from that old Greek philosopher, Socrates, who educated his countrymen by asking them which made them *think*. That's what we ought to do—make our pupils think out their problems for themselves.

To this purpose, every teacher should cultivate the art of questioning. It is not such an easy art either: for to put a question so adroitly that it will direct a pupil's mind into just the desired channel requires much care and practice. The pupil makes a slight mistake—forgets to sharp a note, for instance. "There is a wrong note in that measure," you say, "which is it, and what is the matter with it?" Perhaps you will have to narrow the original question still further, to a group of three notes or even to the note itself. But do not actually tell him what the trouble is, if possible. So in other matters—fingering, rhythm, and so forth—let him find out for himself the real crux of the difficulty. And especially in phrasing, let him decide the limit of the phrase, its climax note, and how to lead up to this note most effectively.

Thus you will be cultivating his own sense of musical meaning; and ultimately he will be able to bind his phrases together with a due sense of their logical relationship in the scheme of the whole composition. When he is studying a new piece, let him, as far as possible, develop his own interpretation of it, before interfering. Then you may suggest additions or alterations without crushing out his own personal ideas. It is always possible to vary the interpretation of a composition and still have it make sense. So don't try to turn him into a mere poll-parrot of your own playing; but give him all the freedom of choice possible.

Another great aid toward originality is the *imagination*, which is so easily stimulated in children. No doubt the purists are correct in their exaltation of "absolute" music over music with a so-called "program." But if we are after sure results, we will often attain them most effectively by inciting the pupil to devise some little story about the music he is studying. Even giving a name—*Fairy Dance, Santa Claus' Polka, Teddy Bears' Frolic*—to a commonplace little study, will surround it with a magnetic halo of romance in the child's mind.

Try these three devices, therefore, in solving your problem: (1) ask plenty of questions; (2) encourage the pupil's own conception of his music; and (3) appeal to his imagination. Given his freedom in such matters, he will come to understand that any corrections or suggestions which you make are aids toward that for which he is himself striving, and not mere carping criticisms. Teach him, in other words, to become his own severest critic; and he will grow in musicianship instead of becoming a phonographic record of your instructions.

Studying Without a Teacher

Miss M. E. L. asks for advice as to a course of study to pursue without a teacher. She has had several instructors, good and bad, and is now herself teaching a class of young pupils. As there is no teacher available with whom she desires to study, she is anxious to continue her advancement along safe and progressive lines. She also says:

> "I have heard of and read about the works of Mozart, Haydn and many others, but do not dare to attempt them alone. Which ones would you recommend?"

It would be wise for you to follow out a reliable and well-planned course, beginning at a grade that is quite within your ability. For example, you might study systematically Mathews' *Graded Course*, beginning with Grade IV. It would not be necessary or wise for you to start at the very beginning.

Let me urge you, too, to purchase collections of the classics, and to study from time to time whatever of them seem available and interesting. These may be bought in cheap editions at slight expense, and will ultimately constitute for you a library of the very best piano music. As foundation for this library, I suggest the following:

Bach: Two-part Inventions.
Bach: Well-tempered Clavichord, Volume 1.
Beethoven: Sonatas, Volume 1.
Chopin: Waltzes, Preludes and Nocturnes.
Haydn: Sonatas, Volume 1.
Mozart: Sonatas, Volume 1.
Mendelssohn: Songs without Words.
Schubert: Impromptus and Moments Musicals.
Schumann: Scenes from Childhood, Op. 15, and Fantasie Pieces, Op. 12.

Strengthening the Fifth Finger

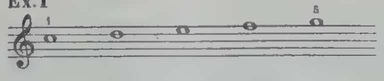
> Will you kindly advise me how to strengthen the middle joint of the fifth finger, which is inclined to weaken when playing octaves, or passages requiring heavy bravura work?—D. K. M.

The solution here is to cultivate a firm position of the finger, which shall not weaken when it is in action.

Try the following exercise:

Place the fingers of the right hand on the keys

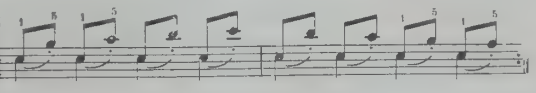
Ex.1



holding the hand in a cup shape, with the fingers curved and firm. Now play C with the thumb, and hold the key down, rotating the hand and forearm up and down over the thumb, with a fan-like motion.

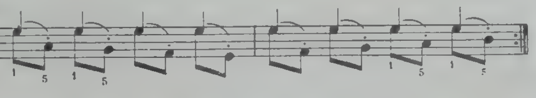
Again, sound and hold the thumb as before, but this time, as the hand rotates quickly back to its first position, drive G down with the fifth finger, keeping the finger fixed in its relation to the rest of the hand. The key should be immediately released, so that the tone is staccato, and the fifth finger should ride up on the key, returning to its first position, in contact with it. Continue the exercise in a similar manner as follows:

Ex.2



For the left hand, all these motions may be reversed, as follows:

Ex.3



Doubtless you will discover means of amplifying these exercises, by which the fifth finger should be taught to stand without flinching the shock of forcible contact with the key.

Preparing for Organ Work

> I would like advice about a pupil, a little girl who is anxious to become an organist. I have given her all the harmony she can absorb at this time. Shall I give her Bach and Handel in the Master Series or more advanced studies of the above masters, or shall I leave that to the organ teacher who has her next fall at the convent, where she will also have piano?—S. K.

I do not believe that there should be any essential distinction between the piano teaching of one who intends to become an organist and that of any other pupil. In the first place, while the pupil is studying the piano, she should learn to play in a *pianistic* manner, and not as though she were playing some other instrument. All the delicate *nuances* of expression, all the fine gradings of touch which can be so finely cultivated on the piano, will contribute in the end toward any other branch of music that she may take up.

Certainly, it is much easier to develop a clean and facile technic on the piano than on the organ, and I therefore recommend plenty of work in scales, arpeggios and other finger exercises, since she will thus be preparing to play organ music which requires fluent execution. Meanwhile, two types of music may be especially stressed. The organist must be able not only to use the hands independently, but the feet also, in pedal passages. Hence music that involves independent voice-parts should be cultivated—the easy fugues of Bach and Handel, Bach's *Two and Three Part Inventions*, and especially the fugues in Bach's *Well-tempered Clavichord*.

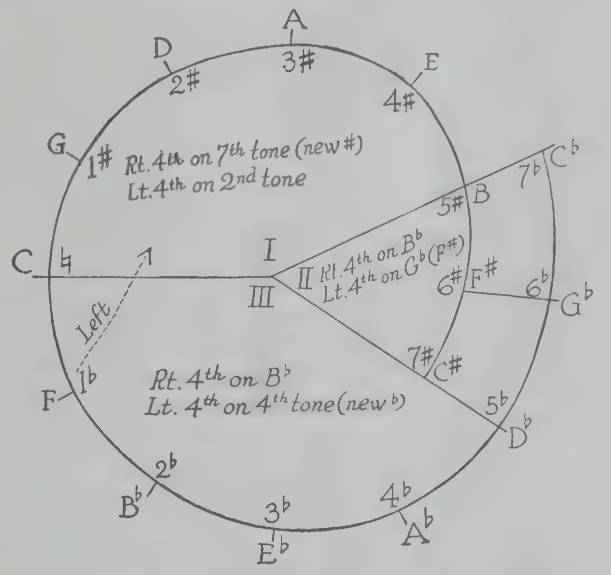
Again, sustained legato music is characteristic of the organ style. Here Mendelssohn's *Songs Without Words* are invaluable, especially those of the serious lyric type, such as numbers 6, 18, 27, 44 and 48. Numbers 1, 5 and 6, of Mendelssohn's *Seven Characteristic Pieces*, Op. 7, may well be added to our list.

You are wise to introduce instruction in harmony. With this work, too, should go an intelligent understanding of the formal structure of every composition that the pupil studies.

Major Scales and Their Fingerings

Some time ago, I asked the members of the Round Table to send me devices or suggestions which they had evolved from their own teaching experiences. I am glad to acknowledge a number of these, but wish I might have many more. Just think! If you have chanced upon a bright idea that has assisted you to solve some knotty problem, you may, through the Round Table, "brighten the corner" for a host of others, who, like yourself, are struggling for the light.

In a recent letter from Mrs. E. D. Boyle, of Rockaway, N. J.—one of our most thoughtful and (consequently) successful members—she presents, among other interesting matters, a diagram of the major scales and their fingerings. Here is her scheme, which seems to me eminently simple and practical:



Inasmuch as the place of the fourth finger in the scale determines that of all the other fingers, this place is the paramount feature of the diagram. The scales as a whole are divided into Groups I, II and III. In Group I the fourth finger comes on the seventh degree of the scale (or on the new sharp) in the right hand, and on the second degree in the left hand. Group II has the fourth finger on B♭ (A♯) in the right hand and on G♭ (F♯) in the left hand. Group III has the fourth finger on B♭ in the right hand (like Group II), but on the fourth degree (or on the new flat) in the left hand. An exception in Group III is the scale of F, of which the left-hand fingering comes under Group I. The scale of D♭ (C♯) falls in both of Groups II and III.

Doubtless other members of the Round Table have in mind helpful schemes for simplifying the subject of scales. May we not have the benefit of these ideas?

"One must look for discipline in liberty and not in a philosophy handed down and good only for weaklings—one must listen to no one's advice but that of the passing wind which tells us the history of the world. Music is made of scattered forces and one wants to make it a speculative son! I prefer the notes of an Egyptian shepherd; he blends with nature and hears harmonies ignored by theory books. Musicians listen only to music written by clever hands; they obey barbarous laws and become a mixture of monkey and slave."

—Claude Debussy.

The Musical Scrap Book

Anything and Everything, as Long as it is Instructive and Interesting

Conducted by A. S. GARBETT

JAPANESE COURTESIES TO KREISLER

RECENTLY returned from a tour of the Orient, Fritz Kreisler tells the readers of the *Strand Magazine* (London) something of his pleasant experiences in playing the violin to Japanese audiences:

"Another fact which struck me strangely concerned the newspaper criticisms of my playing. Instead of being written as they are in our newspapers, each and every one was in the form of a poem. After my concerts I was also presented with poems, as well as the most wonderful golden robes and magnificent porcelain.

"The music I played was quite strange to them, they did not understand it; it is so utterly unlike their own that Western and Eastern music are as the poles asunder. Yet the Japanese were wonderfully appreciative and most attentive.

"To Western ears Japanese music is very wierd and strange, absolutely beyond our comprehension. Some of the greatest vocalists in Japan, artists who are the equivalent of Melba and Caruso, would evoke laughter if they sang their Japanese songs on the English concert platform, whereas if we really understood their technic and music we should realize that they were giving brilliant performances. The European, when he does not understand a thing, laughs; the Japanese behaves with dignity and respects the feelings of others."

THE DEATH OF A PARROT

EVEN in these days, traveling to the far West with a Grand Opera Company is no light matter. Colonel Mapleson in his *Memoirs*, however, convinces us that it must have been much worse in the eighties of the last century. Not only was transportation more difficult, but artists could afford to be more temperamental than now, when they are more easily replaced. The redoubtable Colonel was heading for San Francisco with a flock of song-birds including Madame Scalchi and her parrot when the following happened:

"The night before we reached Salt Lake City Mme. Scalchi's parrot died, which caused the excellent contralto to go into hysterics and take to a bed of sickness. I had announced "Il Trovatore," in which the now despondent vocalist was to have taken the part of the vindictive gipsy, *Azucena*. This I considered would amply compensate for the absence of Nevada (Emma Nevada, a famous soprano). Only half an hour before starting for the theater I was notified by Mme. Scalchi's husband that she would be unable to appear that evening. I insisted, however, upon her going at all events to the theater, as I considered the death of a parrot not sufficient reason for disappointing a numerous public. I threatened at the same time to fine her very heavily if she refused.

"About an hour afterward the call boy came down (to the train), up to his waist in snow, to the door of my car—some little distance from the station—stating that Mme. Scalchi had again gone into hysterics and was lamenting loudly the loss of her beloved bird. On my arriving at the theater with another *Azucena* (this one was lamenting only that she had not dined), I found that it wanted but five minutes to the commencement of the overture. There was Mme. Scalchi dressed as *Azucena*, and it was impossible to obtain possession of her clothing, for she was almost in a fainting condition. At last, however, she divested herself of her gipsy garments; and she was replaced by a new *Azucena*, Mlle. Steinbach."

"IT is frankly unbelievable that the Greeks, for example, who were capable of a poetic, dramatic and plastic art which has never been surpassed, had not a music of correspondingly high development."

—W. J. TURNER.

A STROLLING MINSTREL WHO MADE GOOD

JOHN ALDEN CARPENTER, who included "Pinafore" among the world's ten masterpieces in THE ETUDE, should be glad to know that the Gilbert and Sullivan operas are being revived at the Princess Theatre, London. Henry A. Lytton is the leading comedian and gives the following account of himself to the readers of the London *Graphic*:

"You may ask me which is my favorite rôle in all this big gallery of characters. Without a doubt it is dear old Jack Point in 'The Yeomen of the Guard.'

"You see," he explains, "in real life I have never been a Lord Chancellor, or a political place man like Sir Joseph Porter, K. C. B., or a common executioner like Ko-Ko ('The Mikado'). But I *have* been one of the Jack Points of the world, a vagabond of the villages, wandering about hither and thither in search of a few coppers for a crust, and ever hiding the aching heart and the empty stomach under the jester's livery.

"This, of course, is going back to the early days, though the incidents are as vivid as if they had happened yesterday. 'We were seven,' all down on our luck and content to pool our few indifferent talents as entertainers, just as we pooled our adversities and our small stock of courage. Sometimes we would secure the use of a ramshackle barn, and if our four hours' show brought us a few shillings apiece, business seemed so flourishing that we decided to stay another day! If on the other hand we got no audience at all, we would hike to the highway again, often so famished and weary that but for one or two great hearts in our little band, we might well have given way to despair.

"Our repertory consisted of songs, dances and sketches, and if the truth must be told, we deserved some of our chilly receptions. The Commonwealth, as we were in fact, survived until we reached Guildford, when a friend in need took pity on us and paid our train fares back to London."

PAGANINI'S VIOLIN

ON his way to the far East, Wilhelm Burmester, the noted violinist, stopped long enough in Genoa to take a look at Paganini's violin, now in a glass case in the Palazzo del Municipio. Burmester wrote of his visit in the *Kolnische Zeitung*, and a translation appeared in *The Living Age* (Boston):

"In a silk-lined case, standing on a supporting base, you see the violin made by Guarnerius del Jesu, which belonged to Paganini, father of violin technic. In the circumstances in which I saw it, with three broken strings, there was nothing in its outward appearance to give a man, who did not know, any cause for flights of fancy into the realm of poetry. And yet to me, even in such neglect of this costly instrument, shut away from light, air, sun and playing, there was something deeply tragic. A hundred years ago, men by thousands were enchanted by the strains that poured from these few bits of wood. This magnificent little object, covered with red varnish, helped its master to set up a tradition of violin-playing which, if it had been used in the service of a higher art, would have fully justified its existence. Our modern critics may think and say what they will of Paganini; nevertheless he became a distinguished musician in spite of his technic."

By way of explaining this last remark of Burmester, we must remember that Paganini, notwithstanding his vast gifts, was something of a charlatan who did nothing to dispel the rumor that the devil himself gave aid to his nimble fingers. Had it not been for this Barnumesque touch, however, he would never have drawn great audiences and popularized the violin as he did. He prepared the way for the Joachims and the Burmesters.

JOHN GAY OF "THE BEGGAR'S OPERA"

RECENT revivals of "The Beggar's Opera" in London have reawakened interest in this famous old work first produced at Lincoln's Inn Fields Theatre, January 29th, 1727 (a century before the death of Beethoven). John Gay was a Devonshire man, and an account of his work is included in S. Baring Gould's book, *Devonshire Characters and Strange Events*.

"Gay's friends sat in great uncertainty of the event, till they were vastly encouraged by hearing the Duke of Argyll, who sat in the next box, say: 'It will do—it must do! I see it in the eyes of them!' When *Polly Peachum* sang her pathetic appeal to her parents—

O ponder well, be not severe,
 To save a wretched wife,
For on the rope that hangs my dear,
 Depends poor Polly's life.

and this to the air of *The Babes in the Wood*, familiar to the entire audience from their nurseries, the effect was magical. The audience broke into a roar and the success of the play was established.

"The plot of the piece was thin and poor, but the people were refreshed and rejoiced to hear again the old familiar notes of English music. There were sixty-nine airs in "The Beggar's Opera," and nearly every one was an old English ballad or song air. Gay was not himself a musician, but he had his head full of old ballads and their airs most, doubtless, picked up about Barnstaple or Bideford, and he set to the tunes words suitable to his characters and the dialogue, and then got a German named Pepusch to note them down for him and write a simple orchestral accompaniment and overture. The author, according to Mace, got the entire receipts of four nights, amounting in the aggregate to £693 13s. 6d., whereas Rich, the manager, after the piece had been performed thirty-six times, had pocketed nearly £4000. It was well said that this play made 'Rich *gay* and Gay *rich*.'"

THE LIBRETTIST OF "FAUST"

MARIE ANNE DE BOVET wrote her *Life of Charles Gounod* while the composer of "Faust" was still living. She was also acquainted with Jules Barbier, the librettist of that famous opera. Concerning the meeting of Barbier and Gounod, and the origin of the masterpiece, she has the following to say:

"M. Barbier is an eminently Parisian personality. Everybody is acquainted with his tall stature, his handsome person, and the delicate, fair features with the clear blue eyes that sparkle so brilliantly in animated conversation.

"He belonged to a small group of dramatic poets of whom two at least, Ponsard and Emile Augier, achieved celebrity. It was in the house of the latter, who then lived in the Rue des Pyramides, that Barbier made Gounod's acquaintance. M. Augier had praised to his young friend the wonderful talent of the young musician for whom he had just written a libretto; the introduction took place, Gounod sat down at the piano, and with his young, fresh, delightful voice and inimitable diction, sang the touching musical paraphrase of Beranger's *Old Coat*."

THE MUSICAL HEART

SAYS Romain Rolland, author of the best of all musical novels (*Jean-Christophe*), and of many works on music: "All is music to the musical heart. All that vibrates and moves, struggles and palpitates, the sun-gilded days, the summer nights when winds blow, the filtering light, the glitter of the stars, the storm, the song of the birds, the murmur of insects, the quivering of trees, voices cherished or abhorred, familiar noises of the home, the creaking of the door, the rush of blood which fills the arteries in the nocturnal silence, all that there is, is music; it is merely a question of hearing it."

HOW SAINT-SAËNS COMPOSED

FROM Watson Lyle's biography of the late Camille Saint-Saëns, composer of "Samson et Dalila," the *Dance Macabre* and other well-known works, we learn how this versatile French master produced his brilliant compositions. "When composing the majority of his works, Saint-Saëns apparently wrote ahead pretty steadily until the construction was ended. Sometimes, however, the idea and general outlines of a work were completed mentally before he jotted down a note of it. Other works would be constructed from a series of sketches briefly noted in inspired moments. This latter plan, of course, is a favorite one with many composers; but evidently Saint-Saëns was less addicted to the sketch-book habit than, say, Beethoven. He seldom revised his larger works. Probably this explains the spontaneity that pervades his music, although his facility of technical resources sometimes endangers the naiveté of his melodic flow He was no doubt wise in refraining from the meticulous polishing-up which brushes off the pristine bloom from much creative art. We may deduce the wisdom of this course from the comparative obscurity today of three of his operas that were rewritten efforts, 'Le Timbre d'Argent,' 'Prosperine,' and 'Déjanire,' the last pieced up from the tragedy of the same name by Louis Gallet, to which he wrote the music. In 'Déjanire,' by the way, he makes use of a theme to denote the hero, *Hercules*, that is utilized for the same purpose in his symphonic poem, *La Jeunesse d'Hercule*."

"THE longer I live, the more I am certain that the great difference between men —between the feeble and the powerful, the great and the insignificant—is energy, invincible determination, a purpose once fixed, and then death or victory."

—SIR FOXWELL BUXTON.

Old Studies in New Guise

By V. G. Tupper

REPETITION wearies the teacher and at last has little effect on the pupil. The new way of saying the old thing arrests attention. Every teacher struggles for a limber first finger, and tells the child to pass his thumb quickly under the second finger in scale playing. A new illustration may get the desired rapidity in thumb movement without so much nagging.

The rounded hand is the cage, the thumb the bird. As soon as the second finger is played the bird must fly into the cage—not walk in. Birds fly; so the thumb, clumsy as it is, must hustle some and hop under the hand quickly. In descending scales the thumb hops out rapidly when the finger nearest it plays.

Again that well-known exercise for weak finger R. H. 3 4 5, L. H. 5 4 3, up an octave and back, is more likely to be practiced if the pupil is told to play it only once a day. He must, though, travel up the whole keyboard, which means sufficient exercise in that particular finger climbing. At first the little hand is tired when the third octave is reached; but soon the muscles will strengthen. Every day slowly ascend the keyboard, octave by octave, with the three weak fingers, hands separately, and soon those fingers will be strong and reliable.

Soil From Which Spring Great Composers

By W. Francis Gates

ONE feature in the creed of the Music Optimists (a society recently established) is that only American compositions are to be played on their programs. At first thought, some are inclined to criticize this stand as narrow and as productive of mediocre programs. But it must be remembered that the purpose of the organization is to create interest in American works, not to act as propaganda for Europe.

As to the charge of a reduction in total values of programs, this may be true. But in this connection, there is another point to consider: great composers do not spring from bare soil. They come from a mass of smaller ones.

Just as the giant trees of California do not spring from the midst of otherwise treeless plains, but are surrounded by trees of lesser height, so it is with the great composer. He is the product of many.

Therein lies a strong reason for the Music Optimists and for other organizations whose purpose it is to foster American music. If it were their design to produce at once a great composer or several of them, that would be absurdity. But the object is to create a musical atmosphere of American founding, to foster American composition by performing and hearing American compositions, and by so doing to encourage American composers to multiply and do their best.

And with this is the knowledge that some day other Schuberts will sing, other Wagners will orchestrate, other Liszts will play, and these others will be Americans. They will be giants who have sprung from the mass of men who have had their works performed and applauded by Americans.

From the many spring the few. From the Revolution emerged a Washington; from the whole Civil War came a Lincoln; from all Russia came Tschaikowsky; from the many German composers emerged Wagner. And so from the many composers that it is hoped and prognosticated America in time will produce, there will come later and greater American composers who will overtop the mass of their predecessors.

Great music comes only from well-tilled musical soil. America in the last three or four decades has only begun to till her musical soil; and it is too soon to expect great things. But so sure as the process continues, aided in no small degree by such organizations as those mentioned, just so sure will emerge species *Gigantans*, the giant who overtops his contemporaries and who will cause America to take her place with other and older musical nations.

Play Softly

By May Hamilton Helm

ONE of the finest pianists on the Pacific coast, when asked the secret of his marvelous tone quality, generously "gave away" a valuable lesson in answering that it lay, principally, in absolute freedom from tension. That did not mean a flabby relaxation, for his touch is marked by great virility, but his point was that only the muscles in actual use should be "tensed." All others should be in a state of watchful waiting.

An old Italian proverb might be placed where all pupils could read it—translated if necessary—though often pupils want to know the meaning of something that piques curiosity. It is: *Chi va piano, va sano e lontano.* Which being interpreted is: "Who goes softly, goes safely and a long way." It is as applicable to life as to music, but it has proved so very helpful to so many piano pupils, some of its results may be worth reviewing.

First, playing softly benefits tone quality. Second, it is less tiring to the ears and nerves of both player and hearers. Third, it prolongs the life of the instrument. Fourth, it facilitates memorizing, because the mind is placed in a position similar to the traveler in the fable. *The Wind and the Sun*—"Gentle means will often succeed when forcible ones will fail."

Get the Full Flavor of Your Harmonies

By George Coulter

Do you know what it is to savor your harmonies? It is just like seasoning your food. When you bolt a meal you do not get the proper zest of it, and you miss much of the enjoyment. Likewise, if you are in too big a hurry to play a piece you will fail to relish it to the full. Why be a musical guzzler? Do not think that, because a piece is marked Allegro or Vivace, your chief aim is to get the pace right irrespective of a proper musical conception. The speed will come all the readier after the piece has been realized musically.

Forget all about the marking and settle down to play the piece at a perfectly leisurely tempo—let it be even absurdly slow—while you listen most carefully to every chord and single sound, to see that they are clearly articulated, and also that the tone is always of good quality. Allow these impressions to soak in thoroughly. Skip no detail anywhere—crescendos, diminuendos, accents, ornaments—give them all meticulous attention.

It is in this way that you get the full flavor of a composition, just as the wise reader gets more from a good book by pausing here and there to reflect over what he has read. There is no better way to train your ear in harmony—better than a score of text-books—than this intent listening to chords played slowly. Try it. You will vitally increase your appreciation of music and put a finer edge upon your artistic sense.

"To be a musician nowadays one needs to have an assured and independent means of living, or genuine diplomatic talent."

—GEORGES BIZET.

For Your Vacation, Have Your Hair Permanently Curled

Mothers, Wives, School-Girls, Famous Screen Stars and Society Women All Praise the Nestle "LANOIL" Home Outfit

A single treatment in your own home gives you the curl and wave you need to last for many months

Marjorie Daw, dainty screen genius of Selznick Pictures, thanks the Nestle LANOIL Home Outfit for her pretty waves and ringlets. *"Simply wonderful,"* she writes to Mr. Nestle from Los Angeles. *"No more hot irons or nightly crimpers for me!"*

A pleasant afternoon, with the Nestle LANOIL Home Outfit on free trial, gives results. The Outfit lasts a lifetime and with additional supplies will wave family and friends as well.

IF you are troubled with straight hair, you cannot do better than to turn from the make-shift curling lotions, nightly crimpers or hot irons you have been using, to the wonderful Nestle "LANOIL" Home Outfit for ***Permanent*** Waving.

Shampoos, Moisture, Etc. Increase Curliness

For this dainty Outfit *alone* can give you perfect freedom from hair troubles, in addition to the most charming curls and waves you can imagine—curls and waves that will stay with you ALWAYS, whether you go bathing, motoring, walking or dancing, through the hottest and dampest summer weather.

Simple, Interesting and Quick

The Home Outfit is easy and safe to operate. Children of twelve have been known to wave their mothers' hair successfully. Well over 200,000 of these Outfits are in frequent use all over the world. The main essentials of a wave are to moisten a strand of your straight hair with LANOIL, then wind it on the patented Nestle Curler, and slip the little heater over it. Then, seven minutes gentle heat, and this strand is naturally wavy. Shampoo or wet it as much as you like, the curl in it will stay, and act exactly as naturally curly hair would stay and act. It is unbelievable perhaps, but absolutely true.

Our Famous 30 Days' Free Trial Offer

Imagine the comfort you will derive from naturally curly hair day and night, at home, at seashore, at mountain resort. Imagine the self-confidence it will give you for every summer activity.

Get your Home Outfit now. Send for it by forwarding its cost of $15 in check, money-order or bank draft as a deposit, or if you prefer, deposit the money with your postman. When it arrives, use the free trial supplies to test it on your hair. The directions are easy to follow, and you will be overjoyed at the results. Should you decide to the contrary for any reason, return the Outfit within 30 days and WE GUARANTEE (*backed by this magazine*) to refund the $15 immediately, without question, deduction, or delay.

Send for our free illustrated booklet

NESTLE LANOIL CO., LTD., Dept. E
Established 1905

The Singer's Etude

Edited for August by Well-known Voice Specialists

It is the Ambition of THE ETUDE to Make This Voice Department "A Vocalist's Magazine Complete in Itself"

On Singing in Tune

By Dr. G. A. Pfister

THERE is hardly anything more excruciating to the musical ear than to hear singing out of tune. It is even worse than the performance of a string quartet playing an ultra-modern composition written in quarter tones. And yet to sing perfectly in tune involves a quality of voice which has a distinctly hard effect on the ear. This sounds paradoxical, yet it is perfectly true.

It all depends on what we call "in tune"; whether we understand by this term merely what does not sound out of tune to a sharp and trained ear, or whether we require each note to have the precise number of vibrations which science has determined that it must have. These two definitions differ, in fact, very widely from each other.

The writer witnessed a few weeks ago some exceedingly interesting experiments on this point made at the Phonetic Institute in Paris by its director, M. l'Abbé Rousselot, who is recognized as the greatest authority on the science of Phonetics. The apparatus used consisted, firstly, of an instrument registering the sound vibrations on a graph; secondly, of a unique set of tuning forks. The fact that the value of the latter exceeds one million francs, and that it is the only such set existent in the world, will give an idea of its importance. Hundreds of tuning forks ranging from the deepest note which the ear can feel "as a note" to the highest are each provided with ingenious clamps, by the adjustment of which the number of vibrations can be regulated one by one. The largest fork, about 2 ft. high, with prongs about 1½ sq. in. sectional area, produces for instance (at a temperature of 20° Centigrade), 28 vibrations per second, and can be adjusted to 29, 30, 31, and 32. The next fork is built to make 33-43, and so on and on until we come to a tiny fork, scarcely half an inch long. I may mention in passing that nine months' work was required before a satisfactory fork of the smallest size was obtained. All are set in motion by using bows (from double bass to violin).

A Test of Tune

Now supposing someone sings middle C exactly in tune, and the vibrating middle C fork is gradually approached to his mouth, then the sound emitted by the fork will make a strong crescendo as it comes nearer, and often be doubled in volume when it is about an inch away from the singer's lips, If the vibrations of the note sung differ from those of the fork, then no crescendo will result.

Notes sung by a number of noted artists (from the Grand Opera, Paris, and the concert platform), teachers of singing, and students at the Conservatoire were tested. All had been selected on account of their reputation of singing in "perfect tune." The result was rather surprising. While the average number of notes sung "in tune" was 1 out of 22, there were some excellent singers who did not get the correct pitch once in 30 trials—the number provided for in the test; and precisely those were the voices that appeared to us most beautiful and perfect.

The second group of "subjects" were so-called natural voices, mostly people who could not read a note, none of them trained, and none of them having a beautiful or even a good voice. All that could be said for them was that they sang in tune. The results were as surprising as those of the professional group; average notes "in tune," one out of eight; highest number, one in five; lowest one in eighteen—*i. e.*, better than the professional average. Those who sang most in tune had the hardest, most unsympathetic voices.

The graphs made of notes sung by all these people revealed the fact that the voices which appealed most to the hearers were those which constantly moved around the tone required—*i, e.*, alternately lower and higher—but with a *constant* variation (the total of which was less than ¼ of a tone) above and below the required note. If the total variation was ¼ of a tone or more there could be heard a slight "vibrato," increasing to a tremolo as the variation became greater. The "truest" voices, which were also the hardest and coldest, scarcely varied at all.

We may compare this to the vibrations of a string on any string instrument. If the finger pressing the string against the finger-board is kept perfectly steady the vibrations will be constantly alike in number and the note "true." But such a note will be far less appealing to us than one sounded while the finger of the left hand moves slightly backwards and forwards, with the correct position as the centre of these movements. The discovery that the notes of a voice or a string instrument in order to appeal to us must have slight oscillations provides also a scientific explanation of the fact that many "rich" voices and string players possessing a full tone in time develop a "vibrato" or a "tremolo."

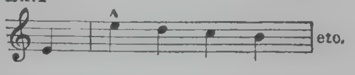
However, these alternating variations from the "true" are not the only factor which makes the quality of a voice. A secondary reason is found in the volume of the harmonics; it would, however, be wrong to say that this constituted the principal reason, for it was proved that of two notes (produced by the same singer) which had similar variations from the "true" note but different volumes of harmonics, the one having stronger harmonics was not the more beautiful of the two.

Beauty of Tone

The beauty of a tone does not principally depend on the volume and the number of different overtones which our ear can register (though not necessarily distinguish apart from the fundamental tone), but on their evenness or proportion. If, for instance, all the harmonics are in correct proportion, all is well. Full voices (as open organ-pipes of wide scale) have a preponderance of lower overtones; but they lack in brightness. Bright voices sound the higher harmonics more than the lower (as do open organ-pipes of narrow scale); soft, but dull, or monotonous voices produce only the *odd* series of harmonics—as a stopped organ-pipe or the clarinet. But if the harmonics are out of proportion—*i. e.*, instead of favoring the lower or the higher or the odd ones, give more of overtones which are in irregular intervals—then the quality will become shrill and unpleasant to the ear.

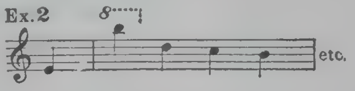
It was illuminating to watch the difference of harmonics in the chest, middle and top registers. Uneven voices are wholly due to difference in the proportion in volume of the various overtones, and as the voice sings higher some of these increase in volume. One particularly fine voice, a deep contralto, showed an extraordinary difference in this. It was decided to make a gramophone record of it, using a particularly sensitive sound-box attached to the recording needle, with the result that on reproducing the record, one of the harmonics was heard instead of the fundamental note which had been sung and heard by the human ear. She had sung:

Ex.1



all the notes except the highest being sung in the middle register. The gramophone registered and reproduced:

Ex.2



A Matter of Harmonics

It may be possible—and I am strongly inclined to believe—that this variation of tones from the "true" note and the volume of harmonics have much to do with, or are even the reason of, the "blasting" of notes in gramophone or phonograph records. Careful observation will show that "blasts" occur most frequently when the note sung by the voice is doubled by some accompanying instrument; but it would happen only when both notes are perfectly in tune—*i. e.*, have exactly the same number of vibrations. As stated, this would not happen very frequently, and also less frequent the more beautiful (though not "true") the voice is. Again, the greater and more uneven the volume of the harmonics —and we have seen that this is more and more the case the higher, and also the more forced, the notes are—the more likely they are to blast on a gramophone record, because it is probable that the ordinary sound-box is not perfect enough to transmit and record the extremely rapid vibrations of the highest overtones, and also because from this there may result what is scientifically called "interference of sound waves," with a consequent rattle or blast. A somewhat similar effect is produced by some organs. If certain notes in certain registers are sounded together, leaded lights of the church will rattle very strongly. (This does not happen with all organs, and where is does happen the notes and registers will vary according to the instrument.) The reason for this is "interference of sound-waves," and the rattle of the leaded lights corresponds to the rattling of the diaphragm of the recording sound-box, which produces a "blast" when the note is reproduced on the talking machine.

I am not prepared to say that the statement just made is a proved fact; experiments could not be made, as there was no apparatus available at the Institute which would have either confirmed or refuted what I have stated.—*From the London Musical News and Herald.*

I consider the most important qualifications for success in the study of voice to be: Voice, personality, enthusiasm and intelligence.

—Sergei Klibansky.

The Voice as a True Instrument

By E. F. Larson

To practically every vocal student comes the difficult task of proper relaxation. Even when he comprehends in his mind the type of magnetic quality he wishes to create, he is at a loss in producing it.

In order to have the proper quality, the tone must leave the vocal apparatus with the same feeling of physical relaxation as one has when he is breathing naturally with his mouth closed. Until this is accomplished it is perhaps impossible to give forth in purity of tone just what the mind wishes to portray.

A splendid ideal for the vocal student to work for is to aim to produce tone easily and without more conscious effort than in winking or rolling the eyes.

To this end, the manner of exhaling the breath is of greatest importance. As an illustration of the physical preparation, proceed like this: With mouth and throat open wide and entirely relaxed, lower jaw hanging, increase the space in the back of the throat by raising upwards and backwards the palate as much as possible without strain. Then inhale a full breath, extending chest and abdomen fully forward and to the sides.

Now all is ready to make tone; but in doing it the all-important thing is to keep the chest extended; trying to extend it more is just the thing to do while giving forth the tone. Automatically this compels the abdomen to expel the breath which is correct, since no tension on the chest muscles can then influence or restrict the quality of tone.

If the student will be very careful to do this painstakingly he should be able shortly to hear himself producing quite perfectly the quality which has been awakened in his mind. Then in proportion as he finds the truest beauty of life, should quality of voice grow.

Plunket Greene on Singing

IN *Musical Canada* the great Irish basso, who delighted opera and oratorio audiences of two decades ago, has the following apt observations worthy the singer's attention.

1. Say your words nicely and distinctly, and keep on your toes with the melody echoing in your heart and the rhythm finding a response in every nerve of your body.
2. Don't sing with your voice—singing is purely a matter of emotion.
3. Avoid too much vocalism.
4. Remember the importance of the great abdominal muscle.
5. Don't get fussed over your song. The less breath you take, the easier it is to sing, and don't forget to sing upon your word.
6. Here is a fine voice going to nothing through opening the mouth too wide. It is a lovely voice being ruined. It is like a bird beating its wings against the bars to get out into the sunshine. Don't do anything different in song from what you do in your speech. Remember the rule for your consonants "on your lips and the tip of your tongue and the back of your teeth."

"A SMALL voice may be only a child without food and exercise; nothing to grow upon. An unlovely quality may be only an acquired and artificial condition, a false shell which careful cultivation of the ear and of the musical sense will remove—the chrysalis holding the butterfly."—Dow.

"RECEPTIVITY, expressiveness, high-strung sensitiveness, all go to make up what is called the artistic temperament, a necessary concomitant of the vocal artist's equipment."—MARCELLA CRAFT.

The Climax of a Song

By Alexander Henneman

No matter how good the rest of the song may have been, if the climax does not "climax" the whole effort falls flat. A good ringing climax satisfies fully many thoughtless listeners, and their enthusiasm and applause often create the impression of success, no matter how poor the rest of the work may have been. This being the case, a consideration of how a climax should be studied and prepared is desirable.

In practicing a song the highest tone forming the climax-tone should always be cut out, before the study of the song is begun. This holds good not only for the beginner, but for the advanced singer as well. No attempt should be made to sing the climax-tone, but the teacher should inscribe a lower note instead. Let us say the harmony is E flat major and high B flat the climax-note. The teacher should substitute the tone G and instruct the pupil never to attempt the B flat in practice until the song is mastered. Then at a lesson when all goes smoothly and a fine G has been achieved, it is well to quietly tell the pupil, "Now begin eight measures ahead of the climax and sing the high B flat." This must be done in a matter-of-fact tone of voice. Anything else is poor psychology. To first prepare the pupil for the tone by a special drill is inadvisable. He has already done this in his transpositions.

In the drills the phrase should have been carried by transpositions, not only to B flat, but to C. And now the assurance of the singer must not be disturbed, but, as if it were an extremely easy thing to do, he is asked to take the proper tone.

It will be found that if drills on the original notation have been made from G upward to higher than B flat, then, though the phrase has been sung on G, placement has been achieved in the drills and the change from G to B flat is easy and placement is instinctive and assured. Should, however, on the first attempt the high B flat be poor, then G must again be taken. This is a sign that either more drills are necessary, or that the pupil has made a special effort and thus frustrated the natural action of the vocal organ. The pupil's attitude for B flat must be the same as it is for G. If he changes this, then he interferes with spontaneous action, interposes his will and decides what causes shall bring the effect desired; and this is fatal.

Even though the high tones come well at this lesson, this does not assure continued success. The pupil must be warned that he may be in poor physical condition at a later practice or lesson, and care is then essential. All students, before very long, develop a premonitory feeling that a climax will or will not respond properly. If a feeling of uncertainty arises a few measures before the appearance of the tone, the lower tone must be substituted. After we have decided to sing the extreme high tone, I instruct my students, should fear arise, to substitute the lower for the higher tone.

The psychology involved in the production of a climax-tone is extremely complex and intricate, and the teacher should realize this and apply psychological principles to the extremely difficult and highly important feat of producing a fine climax to a song. Too much attention or care cannot be lavished on this matter. Not only is it the crux of the success of the rendition, but a well-sung climax gives confidence to the singer. And, if he has been roused emotionally, his placement is instinctive and spontaneous, and a new good tone has been added to his range.

Care and *courage* are the watchwords. The first, to make sure that conditions are favorable; the second, to do the thing with extreme confidence and assurance, convinced that—the preliminary drills having prepared the way, the conditions being right, all fear being eliminated—a fine climax must and will result.

Sustained Work or Florid Exercises

By Frederick W. Wodell

CERTAIN prominent vocal instructors have advocated, for the first study, the use of sustained tones. On the other hand, an English teacher, one of note in his day, issued a book of studies in which he made the point that it was unreasonable to expect the beginner to do more than make a short, light tone, correctly, at the beginning. And one thing is evident: If a tone is not correctly produced, the longer held, the worse for the singer.

Here again is an opportunity for the exercise of the skilled teacher's judgment. But one thing is certain. It is not wise to put off the study and practice of sustained tones too long. Also, over-practicing of florid music, without the steadying influence of work on sustained tones, tends in some cases to cause the voice to become tremulous and more or less unreliable.

Florid Singing

Some voices are naturally adapted to florid singing and master the art with comparative ease. These should be given careful work on sustained tones at an early stage, with great care that there is no attempt at pushing for power of tone, and with insistence on absolute freedom from rigidity at the tongue. Other voices are not so well adapted naturally to singing rapid scales, runs and ornaments; and oftentimes the careful practice of this type of exercise is of great value to them in "loosening up" the voice. In most cases "power" of tone is most surely and safely acquired by working not for power but for loveliness of quality. The practicing of the "swell," first from MF. to P., next from P. to MF., later from PP. through to F. and back, on single tones at easy pitches, is a most useful exercise for developing true "power" of tone, provided it is done with the greatest care to avoid even a suspicion of rigidity at the tongue, jaw and neck. Cultivation of the use of the resonance of the mouth cavity and facial cavities is of the greatest value in developing power of tone. One cannot create "resonance" in a voice. The potentiality is there, according to nature. But one can fail to use the natural gifts of resonance, or can cultivate skill in doing so to the fullest extent. "Resonance," fully as much as skilled breath pressure, gives the color and great carrying power characteristic of the best "operatic" voices.

These considerations must be kept in mind for the fullest success in developing the power to sustain long tones, and also in practicing "shading," or using different degrees of power of tone for expressive purposes. As a rule full voice is not indulged when singing florid music, except for special effects. Certain great singers, with exceptional vocal endowments, have done florid singing on "full" voice. But the average voice adapted to florid work is not naturally a "big" one, and in such cases loveliness of quality and facility in execution are the important points.

"Aren't you going to invite that Mr. Johnson who plays so well to our anniversary party? A good piano player certainly 'makes' a party."

"Yes, that's just why I'm afraid to invite him. Imagine how awful it would be when he started to play on that piano of ours."

She hadn't the courage to invite him

Oh, the disappointment and embarrassment a poor piano can cause. But in the homes where there are Weaver Pianos assurance, satisfaction and enjoyment abound. For the tone of the Weaver Piano is unsurpassed. Its mechanism is so perfect that it removes all thought of mechanics. And these wonderful qualities of the Weaver give a lifetime of splendid service.

Write us for the name of the Weaver dealer in your locality, and ask for the Weaver catalog. Convenient terms are easily arranged, and a liberal allowance made on your former piano. Weaver Piano Company, Inc., Factory and General Offices: York, Pa. Weaver, York and Livingston Pianos and Player Pianos.

What Did She Do to Win Him?

How a demure little wren of a girl was changed almost overnight into an attractive Bird-of-Paradise woman—how she who had been neglected by her young men acquaintances suddenly became a center of attraction, and within a few weeks the radiant bride of the man she had loved in vain for years—this is the theme of a letter received today. Hundreds of other letters just as wonderful have come to us voluntarily from readers of our new, revolutionary book dealing not with sex, but with psychology. "Fascinating Womanhood" shows how any woman who understands certain peculiarities about man's psychology can attract and win the love of practically any man she chooses.

SECRETS of FASCINATING WOMANHOOD

Just 10c in stamps with your name and address on the margin of this page will bring this little book to you, postpaid, in plain wrapper. Knowledge is Power. Send your dime today.

Teaching the Accompanist

By Alice Clausen

Very often accompanists are asked by singers to teach them just enough piano so that they will be able to play their own accompaniments.

A music teacher is in a sense a salesman. The customer comes to him and states what he wants, and if the salesman is honest, he will give him just what he asks for. The pupil is not asking that he be taught how to become a concert pianist, or that he might go into thrills of joy when he plays "To a Wild Rose." He asks for a very definite thing and it is up to the teacher to give him his money's worth.

What is needed that the pupil might play his own accompaniments?

He will need:—

(a) A through knowledge of major scales.

(b) Ability to read at sight.

(c) A good development of the left hand.

The pupil, remember, is a beginner and if the teacher maps out a program which is too ambitious in character, there will soon be one less account for the teacher to keep.

The major scales are worked out first, because they will give the pupil a finger instinct which will make accurate fingering come naturally and easily. They will also be the basis of a sound technical foundation when used in various rhythmic patterns and with different tone colors. It is best to start with the five-note scale used so often by vocal teachers as exercises, and from that gradually work into the octave, nine-note scale, and two octvaes. The pupil always finds it easier to play the scale in contrary motion when he first puts both hands together.

At every lesson read something at sight. Start with the very easy piano pieces and when the pupil reads them easily, leave them. As soon as possible, use songs in the lesson, for it is not piano pieces, but songs, that the pupil wants. Have him play the bass while you play the treble, then change places. Then have him play the melody of the song, while you play the accompaniment. It helps the pupil to acquire an idea of the song's construction, if he first separates it into its parts.

There is a rich field for development in the playing of hymns. It is splendid eye exercise for the pupil to be compelled to watch the four parts at once and the rhythmic training is invaluable.

The left hand must not be allowed to become lazy. Accompaniments in which the left hand follows the melody are easily found. The great fault that most singers have who play the piano after a fashion is that they concentrate their energies on the melody of the song. In much of the modern song literature the accompaniment is of very high importance towards the intelligent interpretation of the song.

Write the Words

By Jean McMichael

One of the most satisfactory means of memorizing the words of a song is to write them, not once but many, many times, on paper, correcting them each time before attempting to sing them from memory. In this manner the words are literally photographed upon the brain.

Not only does this simplify one's memory work, but also it makes the story of the song more clear, and less difficult to interpret, as the words will be found to be more easily retained and remembered longer when committed to memory in this way. The act of writing seems to be peculiarly advantageous.

The Singing Student's Equipment

The young person contemplating the entrance upon preparation for a singer's career will find the requirements for success very succinctly collated in the following short article which Harold L. Butler recently contributed to *Musical America*:

"The high school student who is contemplating taking up the serious study of singing will want to know something of the advantages and disadvantages of this work. He will also want to know what he must do to prepare for a successful career.

"I am placing in the order of their importance those things absolutely necessary to the ambitious student of singing:

"First: a good, natural voice.

"Second: good health.

"Third: a good general education.

"Fourth: at least four years of first-class instruction in the proper use of the voice, together with training in artistic singing.

"Fifth: a good musical education. This means thorough training in sight-singing, theory, history of music and, if possible, in some instrument, such as the piano.

"Sixth: a knowledge of the foreign languages in the order of their importance: German, French, Italian.

"Seventh: the opportunity of hearing many performances of the best music, both vocal and instrumental.

"Eighth: the opportunity of singing often in public—in ensemble as well as in solo work.

"Ninth: money.

"Tenth: energy.

"More and more music is becoming a part of the every-day life of the normal man or woman. Never in the history of this country have there been so many persons who demand music as a part of their recreational pursuits. The smallest towns have their concert and lyceum courses, and more and more these courses are given over to the presentation of good music by well-trained artists.

"The singer is still the favorite performer. No instrumentalists before the public today receive as high fees as do the noted singers in concert and opera. As this is true of the greatest artists, so it is true of those of lesser rank.

"Singers are in constant demand as teachers of music in the public schools, as teachers of voice and singing in colleges and universities, as well as in private conservatories. Salaries for such positions range from $1,000 to $5,000 a year."

Picking Up the Minutes

By Abbie Llewellyn Snoddy

"No, I'm not keeping up my own playing at all, this winter," a young teacher exclaimed, discontentedly. "I have so little time to myself, and it's no use trying to practice unless one has at least two hours clear."

Well, naturally, two hours seem all too short for a student who has been in the habit of practicing five or six hours a day; but, since half a loaf is better than no bread, one can learn, not exactly to content oneself—but at least to train oneself to make the most of the time that is left from teaching. Someone has said that time is so precious that God gives it to us moment by moment, and when we have learned to use those moments well, we have learned one of life's most important lessons.

"Why should not the singer have as thorough an education as the pianist or violinist? Singing is a great art."

—Elena Gerhardt.

The Kindergarten Band

By Andrew M. Strang

Most of our great leaders in the arts and sciences were given the right kind of training in their infancy. Pestalozzi said that Education should begin at the cradle. The biography of any great artist, Heifetz or Kreisler for example, shows that their training did not begin at five or six years of age but at birth. The very atmosphere into which these men were born was the breath of the great music masters. Heifetz's father, a premier violinist himself, moulded the brain, temperament and character of the future virtuoso from the start. A violin, at first as a mere toy, was introduced, when young Heifetz was about three years old. Like incidents were the fruitful beginnings of all the great masters.

Is it not time that we take cognizance of what was done for them and formulate our aims and methods for the Kindergarten child along more empirical lines. Beethoven, we are told successfully led a chorus of adult voices at five years of age. He first evinced his musical greatness by his fondness for a little drum.

This of necessity points the way. The child at three years is strongly epitomizing the race. At this stage he is a little primitive man with very primitive instincts, therefore we should begin with primitive instruments. In other words most of the instruments will be of the percussion type: The drum, tambourine, rattle, little bells of various types and the wood-demon. Then various whistles of the type that is used in the kindersymphonie could be introduced, leading up to the more complicated instruments of the modern band.

When a child goes to the kindergarten he is supposed to learn rhythm from all sorts of rhythmic games. How many people have really learned the lesson is not hard to judge. Did you ever observe how many musicians can not play with a metronome, a player-piano or a record of a selection by some great artist, and actually give the creations an impeccable rendition? Let us observe a group of dancers at any modern affair and have a capable judge tell us just how many people have a real sense of rhythm and have him count the number who cannot keep in time with the rhythm of the music. The results are rather startling. Most of us think that we have a correct sense of rhythm, but we are enjoying a mere delusion.

One may ask the question "Is the introduction of a band into the kindergarten going to guarantee the acquisition of a sense of rhythm?" Positively. And it will accomplish much more if persistently carried out. It will teach him tone color, tone placing, intensity, order and succession.

The melody of the selection would gradually be imitated by the child and this would tend towards tone placing, one of the greatest difficulties of early childhood. All those who instruct the very young realize what a hard thing it is to find a class that is even forty per cent acceptable in regards to singing in tune.

European schools have long had successful systems of rhythm and tone placing. This is the secret of so many of the German musicians having the sense of absolute pitch. How many of us actually know the tone C or A or F♯ when we hear it? How many of us can start a song in exactly the correct key without having some instrument to give us the beginning tone? And still this is all a matter of attainment. We can teach the child, if we start early enough to know the tone A when he hears it the same as we teach him to know the color red when he sees it.

Then along with all these attainments there is a certain element of play and good wholesome fun which will cause a love for doing things, superseding the passive attitude that comes from listening.

The old composers realized the advisability of the kindersymphonie; but, as all art has become more and more commercialized, we have neglected for most part this very root of musical foundation.

In order to introduce any such innovation into the kindergarten, public and private, it would be necessary to consider both the aim in view and the method. We could not expect to attempt Beethoven's overture *Fidelio*, but there are certain little things within the child's scope that could be instrumentalized and rendered faultlessly.

This is the key-note: FAULTLESSLY.

Whatever we would have the band render, we must insist upon being done without a break. It may be only four measures; it may be only one. Then build up measure by measure until a whole creation can be accomplished. If rhythm were taught this way in a kindergarten there would be no question about it becoming a vital and real part of the child.

Sonata Form as Stabilizer

By W. Francis Gates

In point of dignity and scope, chamber music ranks next to that for the symphony orchestra. But the full orchestra is at the command of but few, while chamber music, ranging as it does for small combinations of instruments, from ten down to two, is practical in nearly every community.

The name "chamber music" had its origin in the fact that these more limited combinations of instruments are heard to better advantage in a small hall. Especially was this true in the day when the term first came into use, about three hundred years ago.

In this class of music, the sonata form has been the accepted standard of thematic arrangement and construction ever since the time of Haydn, who fixed the form by his many works in which he used it as the vehicle for his thoughts.

In the orchestra, this form furnishes the boundaries of the symphony; in chamber music, it is the usual form for combination from duet up to octet; and most of the works of the classic period for organ, piano, violin and other instruments are in that form.

Also, the orchestra has its symphonic poem and its overture; and in chamber music we find the precursor of the sonata, the suite, and the descriptive piece, the latter more rare in chamber music than in orchestra.

As in every science and every art there must be some basic formal principles, in music this is found in the sonata form. However, it must be admitted that, with the passage of years, this form has been treated in a more and more elastic way, until, at times, one may question the fixity of the form—so many are the "exceptions to the rule" that are found in theory works and in practical examples.

But as a basic form, a returning point, the sonata holds its value. Otherwise music might approach the formless. Consequent from this, is the value of chamber music, in which the sonata form is more continuously present than in other styles. The symphony and the quartet may be regarded as the anchorage buoys of music, furnishing almost the only stabilizing element of form in composition.

The
PREMIER BABY GRAND PIANO

The dominating, popular priced small grand—first choice of teachers, studios, conservatories and public institutions.

Remarkable grand piano quality at a moderate price—possible only because of concentration, specialization and magnitude production.

Aristocrat Model 5 feet, 3 inches long $725

Other Models $625 and up

Do not decide the important piano question before you see and hear the Premier at your Dealer's. If you cannot secure in your community, kindly let us know, and we shall see that you are promptly supplied.

The new edition "Magic of Music" tells the Premier story in a most interesting and illuminating way. Send for it, also paper pattern showing exact Premier space requirements.

The Organist's Etude

It is the Ambition of THE ETUDE to make this Organ Department "An Organist's Magazine Complete in Itself"

Edited by Well-Known Specialists

Making Organ Playing Interesting to the General Public

By Dr. H. J. Stewart

THE title of this article may appear, at a first glance, to be anything but complimentary to organists, as a class; for it seems to imply or suggest that some of the organ playing which goes on around us is lacking in interest. With all the present-day activity in the organ world, the question as to how organ playing can be made interesting might seem superfluous; yet we must admit that many people, otherwise musically inclined, rather shrink from the infliction, as they regard it, of an organ recital. What is the reason for this instinctive dislike to organ music on the part of the general public? Perhaps it will do no harm to take stock of ourselves, as it were, and to see if organists themselves may not be responsible, in some degree, for this lack of appreciation.

The organist's regular duties, whether in the church or in the recital hall, call for much care and forethought, together with incessant daily practice; yet many of us—not too industriously inclined, perhaps—are liable to fall into a rut and to accept our task as a mere matter of routine. If we yield to this very natural impulse our standards are lowered; and the indifference which we feel will be reflected in our playing.

Careless Church Organists

As the great majority of organists are engaged in church duty it might be well to deal with this side of the question first, and afterwards to devote some consideration to the field of recital work. The organist occupies a very important position in church life. He is the recognized musical authority in his congregation; and those who worship in the church look to him for guidance in all musical matters.

Yet, without reflecting too harshly upon those engaged in church work, it must be admitted that, in many cases, the duties are discharged in a somewhat careless and perfunctory manner. It is true that the salaries often paid to church organists are so inadequate that first-class talent can hardly be expected, nor can much time be expected to be given to the work of preparation. Still, it is incumbent upon the organist at all times to give the best that is in him, not only as a matter of honor and fair dealing, but also from a feeling of personal pride in his work. Let every reader of these lines ask himself seriously whether he is really doing his best to elevate the music of his church to a proper standard of beauty, dignity and devotion. A little "searching of hearts" on this point will do no harm to the best of us. Are our voluntaries—preludes and postludes—always chosen with a view to their appropriateness to the general scheme of the service; or de we at times offer inappropriate selections, merely because we wish to "tickle the ears of the groundlings", or to display a fluent technic?

If it be permitted, for a moment, to speak of my own experiences, they may perhaps illustrate the point I wish to make. Frankly, I have learned a great deal since giving up regular duty as a church organist some few years ago. As a member of the congregation, very many things have been learned which had escaped me when engaged in the round of duty; and if it should ever be my lot to return to the church organ loft, surely I should find myself all the better for the opportunity of viewing the question of church music and church organ playing from the layman's standpoint.

Stainer Always Learned

The late Sir John Stainer once remarked that he had never listened to a service, even in the smallest village church, without learning something of value. A friend who was inclined to question this statement said, "What can you, organist of the great cathedral of St Paul, learn from listening to the music in a village church?" "Ah," replied Sir John, "we can learn what to avoid as well as what to imitate." There is a world of truth in this remark. We should always listen to the "other fellow," not in a spirit of carping criticism, but rather to take stock of ourselves, and to see whether we have not perhaps fallen into the same errors which we notice in his performance.

So far only voluntaries have been mentioned; but the same process of self-examination may reveal weak spots in other details of the church service. For example, if the organist—as frequently happens—is also the director of the choir, does he approach this side of his work in the proper spirit—a spirit of reverence and devotion, and a sincere desire to bring the full meaning of the sacred text home to the congregation? Does he ever make a close study of the hymns, for example, so that their message may be properly conveyed to the listener? We find in every collection of hymns some of the most exquisite poems in the English language. What a field for the development of taste and expression in our organ accompaniments! Take, for example, such beautiful hymns as "Lead, Kindly Light," or "Abide With Me." Here we have poetry of the highest order, yet it has often been my fate to hear these hymns accompanied in such a careless and perfunctory manner that it was evident the beautiful verses of the text were entirely unappreciated by the organist. Yes, it is feared, we must admit, that much of the organ playing heard in our churches is not "interesting," or even devotional. As St. Paul says, "It is high time to awake out of sleep."

Carelessness in Details

After all, it is in the smaller details of a church service that we find most to criticize. An anthem or offertory may be beautifully sung and tastefully accompanied; yet if in the same service some hymn, or response, or even an "amen" is carelessly rendered, we shall find the congregation very apt to overlook all the good work of the organist and choir and to remember only the neglect of these minor details. We cannot, therefore, afford to relax our attention, even for a moment, without running the risk of failure and humiliation. The organist must always remember that it is by example, rather than by precept, that a proper spirit of devotion can be developed in the choir. Every member of the musical organization naturally looks to him for leadership, and his attitude will be reflected by those under his direction.

To this point only the church organist has been considered. It is now time to say something of organ recitals and recitalists, although to a certain extent one branch of organ playing is involved in the other. Even church voluntaries offer some opportunity for the development of solo playing, and there is a growing tendency to include a short recital as part of the Sunday service. Evidently most organists welcome this addition to their regular duties and sincerely endeavor to the best of their ability to make the selections interesting. Perhaps a few words on this phase of the subject may be helpful.

Four Important Details

Organ playing depends for its interest and success upon several things, which may be classified under the following heads: (1) selection of pieces; (2) registration; (3) touch; (4) interpretation and expression. Let us consider these points in detail. First, the selection of pieces; and here it is very important to take into account your audiences and their musical capacity. If the program is designed for an audience accustomed to high-class organ music we may safely include selections which might be unacceptable in communities where organ playing is not understood, and therefore not appreciated. Again I venture to quote from experience, with special reference to work during the past eight years as municipal organist of the city of San Diego.

On taking up these duties I was faced by the fact that the organ, as a solo instrument, was entirely unknown to musical people in this community. None of the organs in the city was adapted to recital work, and therefore the literature of organ music had never been exploited. Obviously, the first thing to be done was to arouse interest in the instrument and its possibilities, and with this object in view I framed my programs, for the most part, upon popular rather than upon academic lines. Gradually the higher forms of organ music were introduced. Little by little the taste of the public improved, until now, after eight years of patient work, one may count upon a sympathetic and friendly attitude towards the best works of the great composers. Quite frequently requests are received for one or other of the Bach preludes and fugues and the Mendelssohn sonatas are not forgotten. In this way my recitals have been of great educational value to the community, and they have contributed in no small degree to a wider appreciation of music in general. In planning our programs we must never forget that in every audience there will be many who resent the educational process. As they frankly tell you, they know nothing about music, but "they know what they like." They simply come to be amused, and if the expected amusement is not forthcoming they feel aggrieved.

Good Things for the General Church-Goer

Such people can be satisfied, and eventually won over to an appreciation of good things, by including in every programme some numbers which are within their rather limited capacity. Such pieces as Beethoven's little *Minuet in G;* Thomas' *Gavotte* from "Mignon"; Elgar's *Pomp and Circumstance,* and Lemare's *Andantino,* have a popular appeal; yet they are all good, and may be included in any programme without lowering the dignity of the instrument or clashing in any way with other and more elaborate selections.

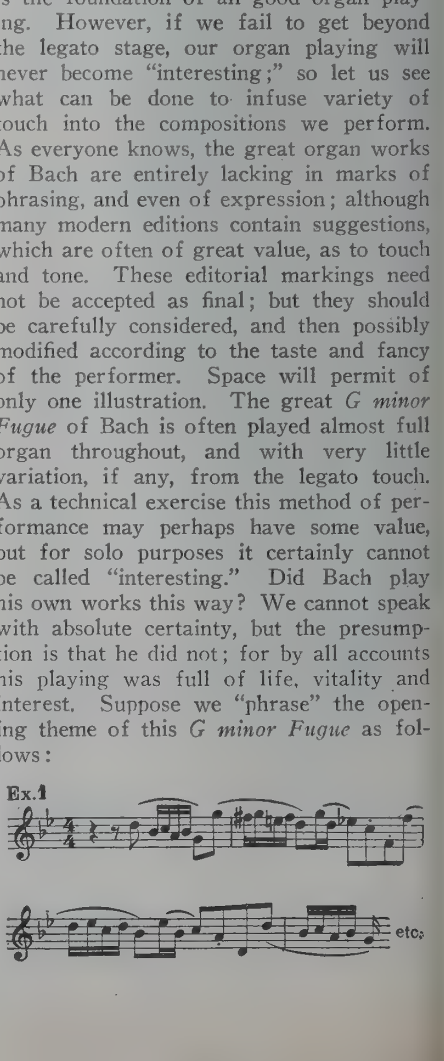
The second point—registration—must be carefully considered, for here we are liable to fall into a rut, and if this happens organ playing ceases to be "interesting". As an extreme case I may quote a musician, long since passed away, who for many years was organist of one of the great Oxford colleges. Every day the dear old gentleman would take his seat at the organ, and invariably he would draw the same combination of stops, so that the monotony of his playing became the subject of irreverent comment on the part of the undergraduates. I have no doubt that if he were alive to-day he would be found continuing the same time-honored custom. As he once remarked, "stops are difficult things to manage, and the less you change them the better."

Misleading Stops

One of the chief difficulties in registration arises from the fact that stops bearing the same name do not always produce the same result. Moreover, our organ builders are fond of indulging in fanciful titles, drawn from almost every language under the sun, and often failing to convey a correct indication of the true character of the stop. As we know, Mendelssohn in in his preface to his organ sonatas expressly disclaims all responsibility for registration; and, with the exception of a few very general indications, he leaves everything to the taste and fancy of the performer. There can be no doubt that this is the best plan. The great drawback is that an inexperienced organist is often left in doubt as to his registration and frequently errs in his choice of stops. The only remedy is to listen to standard works, as played by leading recital organists, or—better still—to seek instruction from someone whose position in the organ world entitles him to speak with authority. Above all, avoid monotony in your registration. Even at the risk of being thought eccentric, you must strive for variety in registration if you wish to make your playing "interesting"

The third point, touch, raises some very important questions. Every organ student, in the early stages of his study, is taught to acquire a pure legato touch; and it is certainly true that this method is the foundation of all good organ playing. However, if we fail to get beyond the legato stage, our organ playing will never become "interesting;" so let us see what can be done to infuse variety of touch into the compositions we perform. As everyone knows, the great organ works of Bach are entirely lacking in marks of phrasing, and even of expression; although many modern editions contain suggestions, which are often of great value, as to touch and tone. These editorial markings need not be accepted as final; but they should be carefully considered, and then possibly modified according to the taste and fancy of the performer. Space will permit of only one illustration. The great *G minor Fugue* of Bach is often played almost full organ throughout, and with very little variation, if any, from the legato touch. As a technical exercise this method of performance may perhaps have some value, but for solo purposes it certainly cannot be called "interesting." Did Bach play his own works this way? We cannot speak with absolute certainty, but the presumption is that he did not; for by all accounts his playing was full of life, vitality and interest. Suppose we "phrase" the opening theme of this *G minor Fugue* as follows:

Ex.1



AUSTIN ORGANS

NEW YORK, Philadelphia, San Francisco, Chicago, Detroit, Los Angeles, Richmond, Atlanta, Charleston, Minneapolis, Cincinnati, Seattle, Troy, Worcester, Baltimore, and many other large centers are possessors of notable Austin organs.

Over twelve hundred are now in use, representing an average output, since active operations a quarter-century ago, of about one organ a week.

The list of Austin owned patents runs into scores.

FIVE MINIATURE
MASTERPIECES

By THIS MASTER PIANIST

(Mignonettes—The Children's Corner)

Cat. No.	Title	Grade	Price
18690	**Lonesome,** *Song Without Words*	3	$0.30
18691	**Wooden Soldiers,** *March*	4	.30
18692	**Lullaby,** *Berceuse*	3	.25
18693	**Sister's Dolly,** *Polka*	4	.30
18694	**Nocturne,** *Complaint*	5	.30

These numbers are big enough musically for the recital programs of the greatest pianists and yet "easy" enough for pupils in the medium grades. They will prove a source of delight to all pupils or pianists playing them. Each one is of an engaging character with clean melodic outline.

THEO. PRESSER CO.
1712 CHESTNUT STREET
PHILADELPHIA, PA.

Play this on the Swell (box closed) with the following registration: foundation stops, 8 ft. and 4 ft.; a soft, silvery mixture (if you are so fortunate as to have one), and one or two light reed stops. With this registration, and the phrasing suggested in the example, the "exposition" of the fugue is transformed into an elfin revel—a dream of fairyland! Of course, after the exposition other registrations will be used, according to the requirements of the score; but enough has been said to show the possibilities of variety in touch and phrasing.

Learn the Composer's Thought

"Lastly," as the old-fashioned clergyman used to say, a few words may be added on "interpretation." However much we may differ in our conception of any piece of music, it is necessary to form at least some definite idea as to its meaning and purpose. We may be sure that every composition worthy of our attention has some underlying thought or sentiment—something that was in the mind of the composer which he wished to express when placing his ideas on paper. Occasionally there is a definite title to guide us, but more frequently—especially in organ music—there is nothing except some indication of speed, such as *Adagio* or *Allegro*. In such cases we must be guided by the music itself; and careful study is necessary if we are to form a proper conception of the work and to give to it an individual interpretation. I have often found it helpful, especially when playing pieces of the romantic school, to form a mental picture of some kind. For example, Chopin's *Nocturne, Op. 37, No. 1*, in G minor, suggests to me a beautiful lake by moonlight. We hear a lovely melody, played by an unseen violinist. Then, from a distance, a religious chant, sung by the choir of a chapel or monastery; after which the violin melody is resumed. If you keep this picture in mind throughout the piece you will find your thought reflected, more or less, by the audience.

Above all, in every piece you must strive (1) to discover the thought in the mind of the composer; and, (2) to convey this thought as clearly and definitely as possible to your audience. There may be some technical flaws in your performance perhaps, but if you succeed in bringing home to your audience the message of the composer, your playing will always be "interesting."

Voluntaries in Church Services

By J. F. Gairns

In some respects this subject is an old one, as evidenced by recent correspondence in these pages; but, from the point of view of what I may term the "ordinary" organist, I am afraid that no one seems to have taken quite the right attitude. The real aspect, as it appears to me, is the relation of voluntaries to the services of our churches and chapels; and on this subject I have somewhat decided opinions which are, I hope, worthy of being stated.

The usual arguments appear all to be based on the assumption that the voluntaries represent the musical commencement and conclusion of a service with which they have only a slight connection. To my mind, however, the connection is a very strong one and the stronger it is made the better.

As I understand it, a church service is one of public worship, with a twofold character. First, it is a service where those who acknowledge the same Master and who serve the same Lord meet together for praise and prayer and for the study of God's Word under the guidance of one of His accredited ministers. But it is also a service intended to help those who are discouraged and who find the Christian life difficult; to comfort and strengthen those who are in trouble or are downcast; and, perhaps more importantly still, to guide those who do not acknowledge the Saviour of mankind to trust themselves to His keeping.

It is not until this twofold aspect of our church services is generally realized that the real position of music can be appreciated. That music is a very important factor is, I think, generally acknowledged; and every organist is agreed that the choice of hymns and tunes, their treatment by choir and by organ and details of that character do much to assist or mar what is perhaps best, though rather inadequately described as the "religious atmosphere."

Yet, when it comes to the voluntaries, the concluding one in particular, the general idea appears to be either that it constitutes an opportunity for the organist to show off his capabilities or else it provides an attractive musical entertainment for those who care to stop long enough to hear it.

Coadjutor of the Minister

I am sorry to say that there are many churches and chapels where both the service and the way in which it is participated in by the congregation not only foster such conceptions but are also best served by voluntaries of a recital character. But I do think that every attempt should be made to carry out the right idea; and there are large numbers of places of worship where this is the only way to make music occupy the right place. The organist should not be merely the paid servant of the congregation but the coadjutor of the minister in the services. In fact, I would go still further and suggest that it is quite possible, and undoubtedly happens, that sometimes an organist will mar the effect of a really helpful sermon, while it is quite as possible and happens quite as often that one is able to give just the right finish to a service and thereby do it perhaps as much good as the minister may have done by his choice of subject and his treatment thereof. Moreover, one might go even further than this and suggest that sometimes the work of the minister is least important in carrying out the true conception of a religious service; and the credit, if such a term is admissible in this connection, of good results may be primarily attributable to the treatment of the musical features. For example, I have known several instances where, at the conclusion of a sermon, a soloist has sung without announcement, perhaps making a choice of hymn or of solo by arrangement with the organist while the address has been in progress and has thereby put (as it were) the finishing touch upon the theme of the discourse. Again, I have known cases where at the conclusion of a very serious and soul-searching discourse the organist has merely played a few bars softly in continuation of the last notes of the closing hymn or of the concluding Amen or has refrained from playing anything at all because he felt that anything he could do would spoil the "atmosphere" of the service.

No more wet clammy hands when you play

Send for trial bottle of Odorono—it will harmlessly correct this condition

Wet, clammy, slippery hands—those who play know the extreme discomfort, even the danger they can be. For this condition seriously affects ease and accuracy of movement.

Excessive perspiration of the hands and underarm is caused as often by nervous excitement as by heat. Physicians say it is a condition which should be corrected; that controlling perspiration in such small areas as the palms or underarms is absolutely harmless.

It was to relieve this very annoyance that a physician formulated Odorono, the original perspiration corrective. It is a clear, clean, antiseptic liquid which, used only twice a week will keep the hands, underarms or any other small surface of the body completely dry and free from all distressing moisture.

A perfect deodorant, too

Odorono is now used by more than 3,000,000 people as their one perfect protection against the disagreeable odor of perspiration as well as its excessive moisture. For they have learned that underarm odor is a danger into which one may fall unconsciously —in spite of careful soap-and-water cleanliness.

One application of Odorono will give you complete relief from *all* perspiration annoyance for at least three days. It keeps your clothing fresh, sweet and unstained and safeguards your personal daintiness from any slightest suspicion. And if you would enjoy dry, comfortable hands when you play —just one simple little application of Odorono to the palms and underarms! At all toilet counters, 35c, 60c and $1; or sent postpaid.

Three generous samples for the Underarm Toilette

RUTH MILLER
427 Blair Avenue, Cincinnati, Ohio

I enclose 10c for which please send me samples of Odorono, Creme Odorono (for odor only) and Odorono Depilatory, with booklet.

His Loving Kindness......... *Schuler*
ORGAN
Marche Melodique .... *Diggle*

TWENTY-FIVE MELODIES FOR EYE, EAR AND HAND TRAINING. By Mathilde Bilbro. Price, 75 cents

These little pieces may be regarded as second grade studies. They are intended to aid in establishing the position of the hand upon the keyboard, attaining freedom, training the eye, especially in leger lines, in staff positions and cultivating a musical ear. These studies are all tuneful and interesting to practice. Altogether this set of study pieces promises to become popular with teachers as well as students well in the second grade.

THEODORE PRESSER CO. PHILADELPHIA, PA.

Special Summer "Get Acquainted" Offer

Treat Your Musical Friends to a Delightful Surprise

WE WILL SEND THE ETUDE MUSIC MAGAZINE TO ANY ADDRESS FOR JUNE, JULY, AUGUST

THREE SPLENDID MONTHS FOR ONLY 35 CENTS! THINK OF IT!

Over 50 Excellent Pieces **Over 200 Inspiring Articles**

FOR ONLY 35 CENTS
(Stamps acceptable)

Thousands think nothing of spending dollars for the most trivial things. Why not give your friends a musical treat by introducing them to the world's most widely demanded musical magazine.

The amount paid will be credited toward a full year's subscription on receipt of the balance ($1.65).

ETUDE MUSIC MAGAZINE
1712-14 CHESTNUT ST. PHILADELPHIA, PA.

The biggest musical "buy" of the times

Possibly this may suggest too much pandering to the emotional side of religion and it is quite likely that few of my readers will go with one so far; but it leads to the point at which I have been aiming—that the choice of voluntary is as important as the choice of hymns and of tunes.

Plenty of Good Easy Voluntaries

In the case of the opening voluntary, the organist usually has a free hand; but, as he is generally informed beforehand of the hymns to be sung, he should be able to gauge the character of the service to follow and adapt his music accordingly. The usual practice is to play something soft and only moderately attractive; still, I see no reason why, if the subject is to be a joyful or a stirring one and the hymns of a praiseful character, the organist should not play something reasonably loud and stirring in character. But, whatever it may be, it should at least be good; and I am afraid that I must also express the opinion that it should not be selected from any of the usual collections of what are termed "easy voluntaries for the organ, harmonium or parlor organ." Many of these collections contain some good material, but some also contain much that is mediocre, while most of what is good can be obtained elsewhere. There is apparently an idea among many "ordinary" organists that any music with a big name is too difficult. As a matter of fact there are plenty of comparatively easy movements that make splendid opening voluntaries and they are to be found in many places. Oratorios and cantatas contain them (perhaps vocally arranged); pianoforte sonatas and so on can be drawn upon, while there are, of course, the standard organ compositions and arrangements. But whatever may be the ideas of the individual as to the kind of opening voluntary, there is no lack of material if only one will take note of what is to be found in one's own collection of music as it accumulates.

As regards the offertory, the music played during this is often open to some comment. The average "offertoire" is, to my mind, very unsuitable; and I prefer that something should be played that is interesting to listen to, well treated, with a reasonable body in it (this does not mean loudness) and providing for expression on the part of the player. So often the voluntary is a thin, mediocre and uninteresting production; and everyone is relieved when the organist finishes and the service can be resumed. In this connection some of the quartets or easy choruses in cantatas or oratorios make good offertory pieces, for the part working and complete harmonies give the requisite body; and they usually provide for a reasonable amount of expression by means of the fingers and slight stop changes without the extravagances that the use of the swell pedal, as sometimes practiced, entails. Then there are many small pieces by well-known (and sometimes unknown) composers that come in very useful.

The Closing Voluntary

And now as to the closing voluntary, to which considerable attention was devoted in my introduction. As already stated, the closing voluntary should be selected in view of the character of the service. Sometimes, but rarely, a good march is in place; though more marches are used than anything else, certainly by organists of a certain class. After a good rousing address, including well-known martial hymns, a march (so long as it is not of the flowery or jiggy kind) is appropriate; but a good robust, stirring piece of music that is not a march or only partially of a march character is better. But there is one drawback carried by so many pieces of this character—that is, they usually begin quite full power; it is difficult to find a piece with a quiet leading up. Nothing seems so incongruous after, for example, the Benediction or a vesper hymn as the sudden striking up of a loud and energetic voluntary. But unfortunately the practice of many organists of playing a few soft bars in continuation of a final Amen appears unsatisfactory, or at least it often is. One of the most useful pieces, considered in the light of the foregoing remarks, is the chorus "Oh, Father, whose Almighty power" (from "Judas Maccabæus"). This commences softly, but still adequately, and gradually leads up to the fugue, which constitutes a fine energetic martial movement admirably suited for the conclusion of a stirring address. Another useful item is the epilogue from Sullivan's "Golden Legend." The opening blasts of the trombones should be left out, but the unison of the first two stanzas makes a pretty but substantial air, with a full accompaniment that is not over difficult to manage by a little adaptation with the solo on another manual. The second stanza can be varied in stop treatment; and then, if the performer fights shy of the fugal working up, one can skip this and continue without a break to the finishing bars, working up with splendid effect to a full organ climax.

If the service has been of a quieter character, there are many organ movements that are neither too elaborate and rapid nor too sleepy and quiet which can be used very effectively without suggesting sleepiness or giving the idea that everyone is pleased to be relieved from the tedium of the service. And then, if the service has been of a very impressive character, a good idea is to play a slow and not too loud movement; and some of the choral settings to be found in oratorios come in useful, though legitimate organ music provides plenty of material. It may be said that one can hardly expect the average organist to have a large repertoire always available and to be prepared to play all sorts of music according to the way that the service strikes him. But a good deal can be done in this way, even at the expense of extemporizing; and every organist who is worth his salt and who is in the happy position of having a minister with whom he can work comfortably and enjoyably should be able to carry out these ideas. Of course, there are many cases where the conduct of a service is not calculated to encourage an organist to do his best and to do his part as suggested; but if the necessity of an ideal is realized, it becomes comparatively easy to realize this ideal and it is in this spirit that the foregoing remarks are submitted.—*Musical Opinion & Music Trade Review* (London, Eng.).

The Jazz Problem

A fair, impartial and serious consideration of the Jazz Problem by many eminent musicians and music lovers will make THE ETUDE for August one of the most discussed numbers we have ever published. Among the composers represented will be Mrs. H. H. A. Beach, Felix Borowski, Henry F. Gilbert, Percy Grainger, John Philip Sousa, R. M. Stults and the famous "Kings of Jazz," Paul Whiteman, Vincent Lopez and others.

Question and Answer Department

Conducted by ARTHUR DE GUICHARD

Always send your full name and address. No questions will be answered when this has been neglected.

Only your initials or a chosen nom de plume will be printed.

Make your questions short and to the point.

Questions regarding particular pieces, metronomic markings, etc., not likely to be of interest to the greater number of ETUDE readers will not be considered.

Consecutive Fifths and Octaves.

Q. *Is one ever allowed, in composition, to write consecutive fifths and octaves, or an occasional tritone? I notice that several of the most modern composers write them; what is the rule?*—A. J., Pontiac, R. I.

A. Let the reply be in the words of a great master. In a well-known letter, in which Verdi refused the position of Director of the Naples Conservatoire, he wrote: "Licenses and errors of counterpoint may be allowed, and are sometimes beautiful in the theatre—in the conservatoire never." To-day, the tritone is an everyday acquaintance—worse luck!

The Conductor's Art . . . Euclid . . . Euterpe.

Q. *Will you kindly tell me the meaning of "Cheironomy"; and who were Euterpe and Euclid? I have heard of the latter as an ancient mathematician, but did not know he was classed as a musician!*—R. H. H., Baltimore, Md.

A. "Cheironomy" (from the Greek, *Cheir*, hand) means the art of directing by hand, not only in giving the time, but by indicating the phrasing and the shading. Euterpe was the Muse of stringed instruments. Euclid was a Greek mathematician, who lived in Alexandria in the time of Ptolemy, about 300 B. C. It is said that he wrote two treatises on music: an "Introduction to Harmony," and one on the "Section of the Scale." But, while the latter may have been written by him, the authenticity of the former is very doubtful.

An Old English Instrument; and Two Chinese.

Q. *In a book I have been reading I have come across the names, Cittern, Chapeau Chinois and Cheng; but, other than that they seem to be some species of musical instrument, I have no idea what they are. Will you please enlighten me?*—Musicus, Syracuse, N. Y.

A. The Cittern (Cithern, or Cithorn) is an old English name for a guitar strung with wire instead of with gut. Its eight strings were tuned to G, B, D, E, or similar intervals. It came into vogue about the year 1580 and was very popular, being found in every barber's saloon for the use of the customers while awaiting the magic words: "You're next!" The Chapeau Chinois is a set of small bells arranged in the form of a Chinese hat, or Pavillon Chinois. The Cheng is the Chinese organ. It is composed of tubes of different sizes having free reeds, held in the hand and blown by the mouth through a mouthpiece, like a cornet. The Cheng was the forerunner, in Europe, of the accordion and the harmonium.

"Bis"—"Bisser"—"Encore"—Again.

Q. *When in Paris recently, I was rather puzzled as well as somewhat startled by the shrill cry of "bis, b-i-i-s, b-i-i-i-i-s," emitted by the audience at the end of a number. I did not know what to make of it, until the performer came on again, bowed and repeated a verse of the song, so I supposed it was meant for an "encore." Will you please tell me its exact significance?*—M. T. M., Milton, Mass.

A. "Bis" (Latin) means twice. The French have made a verb out of it: "bisser," to repeat, or perform again. It is the equivalent of our use of the French word "encore." Its employment is a curious mental twisting. The French use Latin and we use French when we want (like plain Oliver Twist) to ask for "more."

Notes in Alt and in Altissimo.

Q. *Where do the notes "in Alt" begin and how far do they go?*—Bertha, Dearborn St., Chicago.

A. The notes "in Alt" begin on the G immediately above the treble stave; the notes "in Altissimo" begin on the G, one octave above that.

Foreign Nomenclature.

Q. *What do the French mean in music by the words "Blanche" and "Noire?"*—N. E. C., Boston, Mass.

A. "Blanche" (English, white) is used as in English to describe a hard, colorless quality of voice; it also means a half-note, and "noire" (black) a quarter-note. These notes, in English, are termed respectively, minim and crotchet.

Piano Soloist or Accompanist?

Q. *1. Which is harder or more difficult, piano solo playing or accompanying. 2. Which requires greater musical knowledge? 3. In short, who is the better musician, the virtuoso-soloist or the accomplished accompanist?*—S. S., Pennacook, N. H.

A. 1 and 2. Accompanying. 3. The accomplished accompanist, as a general rule. To-day, when the accompaniments to songs and instrumental solos assume symphonic proportions both, in style and development, the role of accompanist requires just as great and polished power of finished technics as any virtuoso. The latter may interpret a composition entirely according to the dictates of his own temperament, subservient only to the composer's indications; whereas the accompanist has to subject his own ideas to the solo performer's ideas and interpretation, to lend his support to these and, by careful nuances, to impart greater significance to the words and literary phrases; all of which shows that, to be efficient, the accompanist should be thoroughly conversant with the language of the particular song of songs—something of which the instrumental soloist is usually ignorant.

Wrist or Finger Movement?

Q. *What is the correct way to render the following:*  *? Should it be played with finger articulation, down and up, or by wrist raising motion? If I try any other kind of touch, I find it becomes too staccato.*—A. M. C. G., Back Bay.

A. The touch should be neither from the raised finger nor from the wrist, but from the arm, which should pull the finger upward in a kind of incipient caress.

Compositions by Mendelssohn.

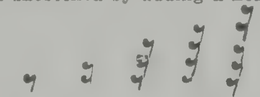
Q. *Are there any compositions for the piano, by Mendelssohn, other than the Lieder, worth while studying? My teacher rather pooh-poohs this composer, saying that he is too antiquated.*—A. C. D., Salt Lake City, Utah.

A. Unfortunately, there are many other teachers in America who propagate the same wrong judgment. No pianists' studies are complete without an intimate acquaintance with the works of Felix Mendelssohn Bartholdy. They supply us with a good knowledge of melodious part writing and give excellent material for obtaining a perfectly sustained, legato, singing touch; requiring at the same time much brilliancy of execution. Compositions which are well worth while studying are, among many others: *Variations sérieuses, op. 54; Andante con Variazione, op. 82; Variationen, op. 83; Scherzo a Capriccio, F♯ minor; Praeludium, E minor; Prelude and Fugue, op. 35, No. 1; Scherzo in E minor, op. 16, No. 2; and many others.*

The Duration of Notes (Time Values).

Q. *After the quarter-note and corresponding rest, what is the order of the time values, in decreasing denomination? What is the shortest note?*—R. A. C., Portland St., London.

A. The 8th (), 16th (), 32nd (), 64th (), 128th (), and even 256th (), The last-named may be found in Dussek, op. 10, No. 2. As the notes are shortened by adding a tail (or crook), so the corresponding rests are shortened by adding a head:



Exaggerated Marks of Expression

Q. *What is the meaning of ppp. and of fff.—are they correct?*—Vaughan K., Providence, R. I.

A. The abbreviations pp. and ff. represent *pianissimo* and *fortissimo*, which are the superlative degrees of *piano* and *forte*, respectively. Logically, there can be nothing beyond superlative—although the divine Bard has given us the well-known line: "This was the most unkindest cut of all." Therefore, more than pp. or ff. is incorrect. Nevertheless, some modern composers throw their ps and fs about broadcast. It is not at all unusual to see pppp. or ffff. Verdi, in his Requiem, has made use of ppppp! probably equivalent to *the very delicatest most extremest softest possible!!!*

Arthur Bird, American Composer and Pianist.

Q. *Is the composer, Arthur Bird, American or English? Can you give me any information about him.*—A. Z., New Jersey.

A. Arthur Bird was born at Cambridge, Mass., July 23, 1856. When about twenty he went to Berlin (Germany), studied piano under Löschhorn, Haupt, and Rohde; composition under Urban. He has made several brief visits to the land of his birth, but has preferred to live in Berlin, where he has gained a good reputation as an American composer in the German style of music. In 1901 he won the Paderewski prize for American composers. He has written a number of successful compositions, including a Ballet, a Comic Opera and a Symphony. He died in Berlin, January 24, 1924.

Have You Faith In Yourself?

Are you satisfied with your outlook in the profession—don't you feel that you could establish yourself in a position of greater responsibility and incidentally enjoy a better financial future if you had a good, practical musical education instead of merely knowing how to play one instrument?

If for instance you understood Harmony, Counterpoint, Composition, Orchestration—if you could play some other instrument like Piano, Cornet, Violin, Organ, etc. Have you sufficient faith in yourself to try to improve musically and at the same time financially as well? Will you take advantage of our free offer for four lessons which we offer to readers of THE ETUDE absolutely free of charge in the hope that they may be the means of starting you upon a career which will pay dividends in increased cash earnings, earnings which you couldn't possibly obtain under your present condition?

We are purely selfish in offering them to you gratis—We have started thousands of others the same way—many wrote out of curiosity—became intensely interested when they saw how practical and how extremely valuable they were—and before they knew it they were proficient on another instrument or had a fine, practical knowledge of Harmony and—they were MAKING MORE MONEY IN THEIR PROFESSION.

A graduate writes—

"I am indeed proud of my diplomas from your Conservatory. They have been recognized by the State University and a life certificate issued me. Through them I have secured a position with an increase in salary of $50.00 per month. I will be glad at all times to endorse your course in Public School Music."

(Name and address furnished on request)

Piano Students' Course by William H. Sherwood.

Normal Piano Course For Teachers by William H. Sherwood.

Harmony By Adolph Rosenbecker and Dr. Daniel Protheroe. This course includes Counterpoint, Composition and Orchestration.

Public School Music by Frances E. Clark.

Sight Singing and Ear Training by F. B. Stiven, Director of Music, University of Illinois.

Choral Conducting by Dr. Daniel Protheroe.

Cornet Amateur or Professional Courses, by A. F. Weldon.

Violin by Dr. Arthur Heft, noted European violinist.

Mandolin by Samuel Siegel, eminent mandolinist.

Banjo by Frederick J. Bacon, America's renowned banjoist.

Guitar by the greatest of guitarists—William Foden.

Reed Organ by Frank W. Van Dusen, noted teacher.

Voice by Geo. Crampton, noted English baritone.

The Violinist's Etude

Edited by ROBERT BRAINE

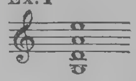
It is the Ambition of THE ETUDE to make this Department "A Violinist's Magazine Complete in Itself"

Little Helps to Correct Tuning

By Ben Venuto

Few instruction books for the violin give any information about tuning other than the bare statement that the strings are tuned to E, A, D, G.

Ex. 1



Many teachers, even, take too much for granted and fail to give the pupil the benefit of the many little details of the task which have come from long habit to be a sort of second nature to themselves. Pupils who have access to a piano are apt, at least at first, to refer to it for the pitch of each one of the four strings. This is a convenient makeshift, but one should outgrow that stage as soon as possible, for two reasons. First, a piano is not everywhere available; second, not every piano is in good tune.

The only note needed is the "A." In a symphony orchestra, this note is given by the oboe, but if one is going to play with a piano, of course it is taken from that instrument. Experience has shown that it is easier to get the correct pitch if, instead of the single note, the chord of D minor

Ex. 2

is sounded.

(There is a scientific reason for this, but the explanation, though well understood, is too long to give here. Suffice it to say, that in this chord, the A is most prominent. In the chord of D major, the D is most prominent, hence that chord would not do as well.)

For tuning in places where there is no piano or other ready-tuned instrument, one should have either a pitch-pipe or a tuning-fork of the correct standard pitch. Be sure when you buy one that it is not the old so-called "concert-pitch," which is now obsolete.

Endeavor as early as possible to learn to tune *while bowing*, although that takes quite a knack with the left hand fingers. Tuning done *pizzicato* is seldom quite correct, because the sound is too brief and dry to impress its pitch perfectly on the ear. It is scarcely necessary to say that the pegs should be well-fitted, in order not to stick or slip. If they are not, that is a job for the violin-repairer, but if needful as a temporary "first aid," one can take out a peg and rub it with chalk, together with a very slight wipe of soap. If these are in the right proportions, it will neither stick nor slip. The strings should wind around the pegs in such a way that as one turns the peg to tighten the string, the little coil of string approaches nearer and nearer to the *handle* of the peg, not the tip. One other mechanical precaution: If you manage to have the last turn of the peg an *upward* turn, the string is more apt to stay in tune. Hence, when a string is slightly above pitch, it is often best to first let it down just below pitch, in order to tune it up instead of down.

(In what comes next, the beginner is in mind: more advanced players are sufficiently familiar with the sound of the proper intervals to proceed more directly.) Having tuned the A to your satisfaction, start on A as *"do"* and sing up the scale *"do, re, mi, fa, sol,"* the *"sol"* being the pitch for the E string. Having tuned the E string, call the A *"sol,"* and sing *down* the scale *"sol, fa, mi, re, do,"* the *"do"* now being the pitch for the D string. Lastly call the D *"sol,"* and sing down the scale *"sol, fa, mi, re, do,"* the *"do"* being the pitch for the G string. If you have a good ear—and only those that have should attempt to play the violin—your violin will now be *nearly* in correct tune. Theoretically, it should already be in *perfect* tune, but practically this is impossible without a slight further correction, which is made while playing the strings together two at a time, listening for what are called "resultant tones" or "differential tones," which were discovered by the great violinist Tartini, early in the eighteenth century.

We will suppose, for instance, that your D and G strings are in almost, but not quite perfect tune. You bow them together, and at the same time turn the G string peg very slowly. As long as there is a slight discord you will hear in addition to the simple sound of each string) a sort of disagreeable vibration which for want of a better word, we may describe as *wow-wow-wow-wow-wow*——(A piano or organ-tuner would call these "beats.") As you get nearer the right pitch, this will gradually slow up, becoming wow—wow—wow——and then wow———wow, until suddenly it ceases, and instead you hear a deep musical tone, faint yet unmistakable, *which is not the tone of either string alone, but is a third tone, exactly an octave below the pitch of the G string.* The same facts hold true in regard to the other strings, sounded two at a time, the resultant tone being an octave below the lower of the two strings. When you hear this tone, stop tuning, as your string is just right.

Bear in mind, however, that your strings *must be very nearly in proper tune* before you begin to listen for the differential tone, because there are other intervals than that used for tuning the violin which give it as well. For instance, suppose your G string was nearer to A than to G—the probability is that you would hear a good differential tone when it was perfectly in tune on A, which of course would be all wrong. Hence you must tune your violin as nearly right as possible before you begin to apply this method for the final finish.

One other hint—if one of your strings is broken, do not attempt to tune your violin until you have put on the new string and have tuned it to pitch. The neck and body of a violin are not absolutely rigid, and the extra pull of one more string will cause the strings which are already in place to flatten slightly. In short—*everything* must be right before *anything* can be right.

The Stand-Still Pupil

By Jean de Horvath

Why is it that the average pupil taught by, shall we say, an average teacher reaches in a short time a certain point of development and there remains in spite of prolonged lessons and at least a certain amount of practice?

Who has not heard, "Oh, I 'took' lessons for six years, but I can't play a thing." This reminds me of a college professor who said of a boy that "he was 'exposed' to Latin but never 'took' it." Perhaps it is the same with music students. It is really a tragedy, at least to the teacher, to find how few pupils honestly use their brains or even a small amount of gray matter in preparing a music lesson. Does the average pupil think that some supernatural power will enable him to hold his violin in position, his hands at the prescribed angles? It almost seems so; and great is the astonishment and disappointment when, after studying several years with a teacher who preferred to let matters drift rather than insist upon accuracy, our young student finds himself totally unable to play anything with any degree of assurance or of pleasure to himself or others.

On the other hand, what a joy a teacher receives from the pupil who comes with each lesson thoroughly prepared, carefully following out the directions as given in the previous lesson, and ready to imbibe new ideas and criticisms. Genuine advance along lines of accuracy and clear thinking has been made by this pupil. That it is a matter of mind training before finger dexterity is obtained is a thought foreign to most students.

Nothing can give a musician more joy than to watch, under his tuition, the development of a new spirit, the gradual but constant building up of a reliable technic, the growth in style, the steadily maturing musicianship.

Pupils, if you want to get the best out of your teachers, "play up" to them and watch them respond. Do not expect to arouse them to really inspirational teaching if the lesson period is spent in constant reiteration of established principles. Give them your best and you will receive a hundredfold of their experience, animation and ambition.

Fake Violin Labels

Labels in violins mean absolutely nothing at this time. Labels of all the old makers have been counterfeited by the million and placed in factory-made fiddles. Countless inferior violins have been made in Germany, Japan and this country, bearing exact reproductions of the labels of Stradivarius, Guarnerius and other makers. The best way to determine the genuineness of any violin is to submit it to the examination of a reputable expert in the nearest musical center. For this reason it is almost a waste of time to write to THE ETUDE for appraisals which we never attempt to give.

The Grown-Up Violin Student

By Sid G. Hedges

It is no unique thing for a man to take up the study of music at the age of twenty and to become eventually a professional player. It is fairly common for a keen amateur to begin at an even much later age and to achieve a fair standard of ability and a highly developed musical appreciation.

The most commonly raised objection, when the chances of the adult music-student are being discussed, is that his muscles have become set and intractable, and consequently the necessary elasticity cannot be imparted to them.

Some measure of truth lies in this assertion—but really it doesn't matter very much, for the amateur. The amateur does not aim at acquiring professional or virtuosic agility. He wants just to be "a fairly good player," able to give some pleasure to himself and to his friends. And this moderate standard does not require any extraordinary technical attainment.

The grown-up student has no thought of ever playing Paganini's *Caprices;* he will be amply satisfied if he can ever do the *Kayser Studies,* and perhaps struggle just inside Kreutzer; for then a vast field of great music will lie before him, and he will not be excluded from at least attempting the majority of the most beautiful melodies written for the violin. Incidentally, he may be barred from playing modern music which seeks to make up in technical difficulty for what it cannot achieve in beauty; but he will not mind that.

The grown-up violin student needs a specially qualified teacher. So many teachers never adjust their curriculum to a pupil, but always a pupil to it.

Now the sort of study that suits a child will not fit an adult. A child cannot grasp reasons for things, an adult can. It is necessary to teach a child correct movements by interminable repetitions; it is sufficient to show an adult why a certain thing is done. Technical matters, points of finger dexterity, may come readily to children but be fearfully difficult for the grown-up. Theoretical matters, which with youngsters need much patience, will for the mature mind present no difficulties. So, it is obvious that a teacher is desirable who is accustomed to teaching grown-ups, or who at any rate can adapt himself.

If the adult student will sit down and think out what exactly is his aim, he will discover that what he most desires is to be able to play any piece of music "straight off." It is this ability, more than any other, which affords pleasure to the amateur. Yet comparatively few students trained in orthodox fashion, ever achieve a decent standard of sight-reading. The value of sight-reading cannot be overestimated and the ability does not come as the result of technical excellence, or theoretical knowledge. It is essentially a practical quality, and one which needs to be cultivated from the very commencement of study. But many teachers know nothing at all of it themselves, and are thoroughly incompetent to teach it. The grown-up student, then, should assure himself at the outset that his teacher is an able and enthusiastic sight-reader, and no teacher should be chosen who does not make sight-reading ability one of the great ends of his tuition.

The adult-student should get the best violin and outfit that he can afford. Exaggerated economy in this original outlay is very foolish, for the possibility of producing good tone is a great incentive to work. No person goes joyfully to his practice when he knows that the best sound he can hope to produce from his in-

FRECKLES

Now Is the Time to Get Rid of These Ugly Spots

There's no longer the slightest need of feeling ashamed of your freckles, as Othine—double strength—is guaranteed to remove these homely spots.

Simply get an ounce of Othine—from any druggist and apply a little of it night and morning and you should soon see that even the worst freckles have begun to disappear, while the lighter ones have vanished entirely. It is seldom that more than an ounce is needed to completely clear the skin and gain a beautiful clear complexion.

Be sure to ask for the double-strength Othine, as this is sold under guarantee of money back if it fails to remove freckles.

strument is an unpleasant, grating whine, or a spasmodic, piercing scream. But the knowledge that one's violin yields a mellow, rich, sonorous tone attracts its owner at every opportunity, that he may reproduce those delights. Old fiddles, of course, are best, else why does every virtuoso play on one—despite whatever he may say about the excellences of new instruments. Stradivarius and Amati violins are not boomed by advertisements—they do not need to be.

Young men of normal height almost invariably require full-size instruments; young women sometimes find a three-quarter or seven-eighth size more suitable. Of course, when one has finished growing it is not of much use buying an instrument that is too large with the hope that one will "grow into it"—this happens with a child, but rarely with an adult. Small violins are not desirable, unless they are absolutely essential; for fewer such instruments exist and the chance of procuring a really good one is very much less than in the case of ordinary, full-size fiddles.

The adult student should practice regularly and strenuously. Thirty minutes work every day is better than a full hour each alternate day.

There is one great asset possessed by the grown-up student which gives him an immense advantage over the average child—it is the "will to learn." Youngsters study because their parents compel them, and consequently they have to be coaxed along with musical sugar-plums and chocolates. The adult requires no such inducement; he already wants to learn; so all the little encouraging pleasantries which take up so much time and lead nowhere in particular can be eliminated from his lessons and studies. He can be "strictly business," and will thus inevitably show the maximum degree of progress.

There is just one defect which proves an almost insuperable obstacle to some would-be violinists—the fact that they "have no ear." Such a person should not waste his time with the violin; but this misfortune is quite rare.

So, providing the grown-up student is genuinely anxious to learn, is not afraid of work, and is able to procure a practical, efficient teacher, there is every chance that he will one day be able to play the violin well enough to give himself and others considerable enjoyment and satisfaction.

Accompaniments, Accompanists, and Accompanying

By Dan K. Jones

SINCE the days of Stradivarius interest in violin playing and violin music has increased steadily until today the violin stands in the front rank as a solo instrument, and with the exception of the piano there is no other which is more frequently heard in public. However, disregarding the Sonatas of Bach (of one of which the crucial *Chaconne* is a part) and a handful of modern novelties used as encores, the violin is seldom heard absolutely alone. It requires an harmonic background, which must be furnished by orchestra or piano.

When one has reached the point of playing with an orchestra he is generally under competent direction, or knows his art sufficiently to direct the orchestra himself, and hence needs little warning as to the importance of his backing. But for the most of the more modest performers this background is furnished by the ubiquitous piano, and a few remarks on the importance of the part the piano plays in the effect produced may not be amiss.

Someone has said that the function of the accompaniment of an operatic aria is not so much to furnish the basic harmonies as to express the hidden emotions and motives that the characters feel but cannot express in the single lines of melody allotted to them. Somewhat the same condition may be said to obtain in the piano accompaniment to a violin number. In it the composer expresses the hidden thoughts and motives that have caused him to pour out his soul on the solo instrument. It is not necessary that the listener *hear* every fragment that goes to make up this atmosphere, but he must be made to *feel* (insofar as he is capable) each subtlety and nuance, if he is to perceive the composer's message—even as the performer must *feel*, in a hundred-fold greater degree, if he is to convey this message to his audience.

Maude Powell expressed the idea with force and clarity when she said: "To the pianist falls the task of creating poetic atmosphere for the soloist to breathe in, so that he may pour out his artistic soul untrammeled. Wherein it will be seen that one of the first principles of good violin playing is, 'First break in your pianist.'"

If one of the first principles is to train your accompanist one of the next is surely this: Study the accompaniment yourself. European conservatories require students of solo and orchestral instruments to study the piano also, and it is a splendid rule. The violinist who can play over for himself the piano part to his solo is far more apt to sense the innermost meaning of his own part. Lacking that ability, however, he can do the next best thing—study the piano part with the pianist, at the piano and without his own instrument. The profit will be infinite and mutual.

It is said that the modern tendency in writing a song and its accompaniment is to make the whole "a virtuoso piano number, with a modest obbligato for voice." The explanation offered is that instrumental composers suddenly discover, like Schumann, that it is fascinating to write for the voice, but (unlike Schumann) they begin before making a study of the art. They do not seem to find composition for a solo instrument so irresistible, and as a general thing they seem to have laid so firm a foundation that they can lavish the greater part of their loving care on the solo part and put the accompaniment in its proper relation to the whole. Hence, to accompany even a difficult number seldom requires ability much beyond the average, insofar as *technic* is concerned. The difficulty lies in bringing to the task sufficient *musicianly understanding*.

Hence let no student feel that accompanying is beneath his dignity; for a good accompanist is one of the rarest things in music. And let no student decide that he will be an accompanist because he feels he has not technic or training to be a soloist. He may succeed in deceiving himself, for a time, as to the difficulty of his task; but he will never for a moment succeed in deceiving the public as to his fitness for it.

Nor on the other hand, is it always the most brilliant soloist who makes the best accompanist. For the successful accompanist must keep himself always in the musical background—a thing most trained soloists find difficulty in doing. And yet, not all are handicapped by having themselves occupying the center of the stage. Rubinstein toured America with Wieniawski, and his accompaniments for that master violinist were superb; and Liszt's accompaniments for singers are said to have been ravishing.

The good accompanist is the one who can hear and feel not only his own part but

Saxophone Players in Big Demand

For Bands and Orchestras, for church, lodge and school musical affairs, for social and home entertainment, the Saxophone is the most popular instrument for men and women, boys and girls. A good Saxophone player is always popular socially and enjoys many opportunities to earn money. Saxophone players are always in demand for dance orchestras. Every neighborhood should have a Saxophone quartet or orchestra.

Easy to Play-Easy to Pay

that of the soloist also. He is the one who can sense the composer's *mood* and recreate it. He is the one who, while listening closely to the soloist, minds his own business so strictly that no marking, no opportunity, no hidden beauty in his own part escape him. He is the one who can make his part subdued where it requires that, and prominent where prominence is necessary, but who can keep it withal perfectly inconspicuous.

And, even as the accompanist can make or mar the efforts of the soloist, the accompaniment can make or mar the solo. The soloist will do well to consider accompaniments somewhat when he is choosing numbers for his repertoire. A violinistic transcription of a folksong, fitted with a modern harmonic background is twice as likely to prove effective as showy fireworks with the monotonous "tum-ta tum-ta" type of accompaniment once popular. If you doubt it just listen to the applause which invariably follows the playing of one of the masterly arrangements of Fritz Kreisler, Leopold Auer or Arthur Hartmann. What is it that makes the work of these men better than that of the myriad "hack" writers? The fact that they cast things so conveniently for the fingers and the bow? In a measure, perhaps, but without the shadow of a doubt much of it depends on the vibrant harmonies with which they have surrounded the grand old tunes. Spoil these and you ruin the number.

Even as harmony is the atmosphere of music, rhythm is the life of it, and it is the accompanist who sets them both. The finest soloist cannot make a success of the most thrilling Spanish Dance if he must work against a sluggish and half-hearted accompanist. And even languor with a distinct rhythm is twice as fascinating as the vaporous sort that seems to wander in and out and 'round about and arrive at no destination at all.

And was it not Beethoven who said that the most effective thing in music is silence? No matter: truer words were never uttered. The dramatic pause, the complete cessation of all sound at some point of climax, is one of the finest devices at the disposal of a composer. To utilize it to the fullest the solo instrument and the accompaniment must stop abruptly, and exactly together, and must begin again simultaneously. And (within reasonable limits, of course) the effectiveness of the pause will be directly proportional to the time it is held.

Perfection in such effects as these, and in fact in just straight playing is achieved only by practice. A soloist is allowed poetic license, as it were, in the matter of tempo; and while no accompanist is required to follow a faulty rhythm he is expected to learn and follow the legitimate fluctuations in the soloist's rhythmic line. Certain string quartets bind their members to play neither as soloists nor in any organization in order that their own ensemble will achieve and retain that perfection for which they are famous. Few indeed are the soloists and accompanists who can afford such an exclusive proceeding; but constant repetition together is all that will enable them to accomplish artistically those variations in tempo and nuance which make up much of the charm of the modern number.

Likewise practice—or perhaps one should say experience—alone will make any accompanist a master of his art. An accompanist is born, not made; but it is necessary that he possess certain inborn qualities: sympathy in really marked degree, modesty, sensitiveness in the best sense of the word, and above all that aforementioned musicianly understanding. It is true that all these qualities must be there to begin with; but only experience—with countless soloists (small and great), numberless styles and types of compositions, and the innumerable difficulties (physical and mental) of public appearance—will bring out these indispensable qualities and make one that rarest of musicians, a good accompanist.

Little Hints

The use of the steel E string is now almost universal. Practically all orchestral violinists, and nearly all of the great concert violinists of the day use it. The best kind of steel E string to buy is the one which has the part of the string which goes around the peg wrapped in silk, thus preventing the wire from cutting into the peg, and the sliding silk bridge protector. The latter is a little woven bit of silk which can be slipped along the string and placed directly over the notch in the bridge where the E string rests. This little silk pad prevents the wire from cutting into the bridge, and also mutes the shrillness of the steel E to a very slight extent, making it sound less "tinny" and more like a gut string. Strings supplied with these attachments can be obtained in any music store, and are well worth the few cents they cost more than the plain steel E without them.

When strings of this kind are used, the peg and bridge are protected, leaving only the nut unprotected. If the little steel E tuner (attached to the tailpiece) is used, however, and the nut is made of good ebony, it will be a long time before the string wears the nut to any appreciable extent.

"Shining" the Violin

M. H. W.—Violinists do not "shine" their violins with oil. They simply wipe off the rosin dust with a clean dry cloth, every day after playing. However if your violin has become very dirty with accumulations of rosin dust, through not being kept clean, it can be cleaned with raw linseed oil to which a very small quantity of powdered pumice stone has been added. Be careful to rub off every bit of the mixture after cleaning. If you wish your violin examined to ascertain its value and whether it is genuine, arrange for an examination by some of the firms of old violin dealers who advertise in the Etude.

Violin Questions Answered by Mr. Braine

An Imitation Strad.

B. D.—According to the labels in your violin, it is an imitation Stradivarius, rebuilt by Anton Aas. The latter was simply the repairer, and quite unknown to fame. The value of your violin depends on how good an imitation it is, and how well it was rebuilt. Get an opinion from a good violin maker or dealer.

A Repertoire.

W. C.—The following are of about the grade you require: *Ballade and Polonaise*, Vieuxtemps; *Faust Fantasia*, by Sarasate; *Seventh Concerto*, De Beriot; *Romance*, Svendsen; *Zigeunerweisen*, Sarasate. These are difficult solo works for the violin, and require an advanced and finished technic to do them justice.

Vuillaume.

G. W. G.—Vuillaume was a famous French violin maker whose workshop was at Paris. He made many copies of the great Cremona instruments, and his workmanship is of a high order. There are many imitation Vuillaumes on the market, so I could not give you any idea of the value of your violin without seeing it, as it may be only a copy.

Berger and Reichert.

A. K.—I cannot trace Robert Berger and Edward Reichert, violin makers. However, obscure violin makers sometimes make good instruments.

Stradivarius Values.

E. G. P.—According to the label in your violin, it was made in 1736, at Cremona, Italy, by Antonius Stradivarius. However, there is only one chance out of hundreds of thousands that this is true, as these labels are mostly counterfeit. You can buy violins for as low as $3 each, wholesale, with this same inscription in them. Some imitation Strads, made by eminent violin makers, are very valuable, notwithstanding the fact that they are only imitations. No one can estimate the value of your violin without seeing it. It might be worth little or nothing; and, again, it might be valuable.

Starting at Sixteen.

H. S.—Your letter shows the spirit which leads to success. I cannot call to mind any *really great* violinists *of the first rank*, who commenced to study the violin as late as sixteen years of age. Almost all such violinists began before ten. However, there have been many who commenced as late as sixteen who became excellent orchestral violinists, violin teachers, and even concert violinists, although not of the first rank.

Unknown Makers.

J. W.—I cannot trace the maker of your violin. However, it may be an excellent instrument, for all that, since there are thousands of obscure violin makers scattered all over the world, who, while unknown to fame, have occasionally made violins of real merit.

Viola and Violin.

F. P. D.—If you have a sensitive, musical ear, and a good natural talent for violin playing, the chances are that you can become a successful orchestral violin player, notwithstanding the fact that your start was made at thirteen years of age. All the studies you name are standard, and if you have studied them thoroughly you ought to have a good foundation. It is a great education of itself to play second violin in a symphony orchestra as you are now doing. Your idea of studying for a second time the studies of Kreutzer, Rode, Fiorillo, is a good one. The great standard studies of violin literature cannot be studied too often. 2. Your viola study will help your violin study if anything. Every violin player should study the viola as well. The study of the viola broadens the violinist's outlook in music.

Ernst—Copyright.

H. G. W.—The compositions of H. W. Ernst are not infrequently heard on modern concert programs, especially his F sharp minor concerto. I remember that a few years ago Kubelik, the well-known violin virtuoso, played this F sharp minor concerto on nearly every one of his programs during an American tour. Ernst's compositions have the reputation, among violinists, of possessing extraordinary difficulties, which they have. However, the best of our present-day virtuosi are able to play any of his compositions. Ernst ranks deservedly high as a virtuoso, in the history of violin playing; but I would hardly rank him musically and technically as being in the same class as Paganini and Wieniawski. 2. Send to the Department of Copyrights at Washington for the book issued by that department telling you how to proceed to obtain a copyright on your compositions. After obtaining your copyright you can submit your mss. to publishers, or publish them yourselves. If you sell outright to a publisher he would attend to getting the copyright.

WILDER MASTER PIANO COURSES

They are just the Courses that Every Piano Teacher and Student has always wanted, for they tell exactly HOW TO DO THINGS,—HOW TO GET RESULTS, not merely what to do; they appeal because in each Course a Real Foundation or 'Master Key' for rapid and sure progress is given; and best of all the Complete Set will cost less than a tenth of what they would cost as private lessons,—less than the charge for an hour's lesson with the Master Piano Teachers of today.

During the Summer all Progressive Teachers investigate the new material that will prove helpful during the coming Season, and all Ambitious Students avail themselves of every possible means for improving their playing.

YOU WILL WANT THE COMPLETE SET OF FIVE COURSES, but do not let the fact that they have been used with great success by hundreds of students in the Author's private teaching and in his classes at the NEW ENGLAND CONSERVATORY OF MUSIC decide you,—first let us send you One Course for examination. Just check the Course you prefer to examine, write your name and address on the blank at the right and mail to us. Upon its arrival pay the postman $5.00 and the slight delivery charge. Examine the Course for one week and if not entirely satisfied return it to us and your money will be refunded, plus the postage both ways.

WILDER PUBLISHING COMPANY
Dept. E-5 West Newton, Mass.

WILDER PUBLISHING COMPANY

New Musical Books

The Fundamentals of Music. By Karl W. Gehrkens. Cloth bound; 211 pages. Published by the Oliver Ditson Company, at $1.50 per copy.

One of the most readable and understandable guides to musical intelligence which has come to our notice. No long-spun-out, dry-as-dust dissertations; but all the essentials to a workable knowledge of the foundational principles of music are laid scintillating before the student or lay lover of the art. Such elusive subjects as Rhythm, Form and Design in music are not only brought within the grasp of the average mind but also this is done in a manner that entices the reader to continue the quest. Numerous musical illustrations add greatly to the interest and value of the text. The small volume should be in the library of every music lover.

The Best Hymns of America—for Sunday School Singing. Compiled under the direction of Anne Faulkner Oberndorfer; harmonized by Mortimer Wilson. Published by J. Fischer & Bro.; at 50 cents per copy.

Sixty of the best hymns—standard, gospel and patriotic—have been selected in an entirely non-sectarian attitude of judgment. These have been skilfully arranged in two-part form for children's voices with accompaniment for piano or organ. A more serviceable and meritorious book of its class could scarcely be imagined.

Modern Music—its aims and tendencies. By Rollo H. Myers. Cloth bound; 89 pages. Published by E. P. Dutton & Co., at $1.25 per copy.

In a concise little book, the author has given us a guide into the spirit of the newer school of composers. In each chapter he has taken up some feature that has influenced the departure of music from the spirit of the old masters. Profuse musical illustrations help greatly toward the understanding of the text.

The Beggar's Opera, Its Predecessors and Successors. By Frank Kidson. Cloth bound; 109 pages. Published by the Macmillan Company, at $1.60 per copy.

Musical history was made by the recent revival of the quaint and melodious "Beggar's Opera." All those interested in the study of the historical development of the world in the matters of musical taste and style will find this little book of the keenest interest. The story of the opera, the sources from which it sprang and incidents connected with its performance are spicily told. The illustrations, and especially the reproductions of Hogarth's satirical conceits, add much to the attractiveness of the work.

The Romantic World of Music. By William Armstrong. Bound in cloth; 239 pages. Published by E. P. Dutton & Company, at $5.00 per copy.

Scarcely any other living writer has had so long or varied experience with notables of the musical world as the author of this work. His style is so alluring that the reader for the moment feels the living presence of the great personages filling roles in the many anecdotes. From the early Patti to the latest triumphs of Jeritza, the whole procession of prima donnas is brought before us, with Paderewski, the primo pianist, dropped in for good measure. Portraits of each, some of them in their stage regalia, add a considerable interest to the volume. The real trial of the reader will be at laying down the book when dinner is called.

Basic Elements of Speech, Song and Melody. By Charles C. Miles. Flexible cloth binding; 137 pages. Published by Charles C. Miles, at $1.50 per copy.

Beginning with the very fundamental elements of the spoken language, the author gives a critical analysis of its principles. In the chapter, "Song Elements," the singer is given many helpful suggestions that will be of the greatest value in aiding towards attaining the greatest effectiveness in her art. Melodies are analyzed as to their characteristics, their construction, their rhythm and melody. A helpful book for both readers and singers.

Musical Groundwork. By F. H. Shera. Published by the Oxford University Press. 84 pages; bound in cloth. Price, $1.20.

A manual for teachers indicating a course in ear training in which the Tonic-sol-fa names, the alphabetical names and the Solfeggio names are used. The book is designed largely for use with British trained teachers, but contains much that is meaty for the American who likes to become familiar with the fine things done in musical education, particularly in this line, in England. One feature of the book is the reference to talking machine records as practical illustrations.

William Byrd. By Sir Henry Hadow. Paper bound; 21 pages. Published by Oxford University Press, American Branch, at thirty-five cents.

A lecture by the eminent English musical scholar and critic. In it the reader is given a brief but interesting survey of the more salient features of the life of this prominent sixteenth-century composer. Quaint touches of musical life and practice, as well as of the customs of the time, sharpen the literary appetite of the reader.

Collective Voice Training. By D. A. Clippinger. Paper bound; fifty-five pages. Published by J. S. Fearis & Bro., at $1.00 per copy.

Out of many years of practical experience the author has produced a small book that is a real mine of precious information for the teacher of music in the public schools, the chorus and choir conductor. The text is in such readable English, the vocal exercises so natural in their development, and the songs so singable, that the one attempting to use the work could scarcely go astray. An examination of the materials makes it obvious that many very practical phases of vocal production may be taught successfully to groups of voices and thus accomplish much that will be of the greatest value in later special study.

Chamber Music for Amateurs. By John D. Hayward. Cloth bound; 81 pages. Published by Charles Scribner's Sons, at $1.75.

An interesting little book on this very interesting subject. Chamber Music has developed so much in popularity in later years that this volume is most timely. Aside from a general discussion of Chamber Music, and of its adaptability to and performance by amateurs, the various chapters which treat of different instrumental combinations give liberal lists of compositions of these types with comments on the dominating qualities of many of them. Everyone interested in an organization for the study of this form of music should have this book.

Studies of Familiar Hymns. Second Series. By Louis F. Benson. Cloth bound; 314 pages. Published by The Westminster Press, at $2.00 per copy.

Here is a book which it is a hardship to lay down. The author has woven historic and romantic data relating to many of our favorite hymns into a fabric as fascinating as a wonderful tapestry of the Renaissance. What infinite care he has devoted to the assembling of those rare bits of information which only the laborer who loves his task will winnow from dusty tomes on unpopular shelves of libraries, from faded manuscripts and a voluminous correspondence! The hymns are treated chronologically, "the story of each plainly showing the close association of religious thought with historical development." The library of no minister, choir leader or religious worker is complete without this book.

Sweet Canada. By Louise Murphy. Board bound; thirty-one pages. Published by Longmans, Green and Company; at one dollar per copy.

Twelve little songs of the birds of Canada, the refrains of which are more or less reproductions of the notes and sounds of the bird under consideration. The collection should be of real interest to teachers and students of bird lore.

The Touch System on the Piano

By Frederick N. Dean

In order to get the best results out of the instrument when playing from memory, one should play with the eyes closed. The reason for making this seemingly strange statement is based upon the fact that it is a scientific imposibility to see the keys under both hands at a single glance, even when scarcely one octave apart. Furthermore the mechanical process is simplified by reducing it to the use of three senses instead of four: namely, think with the brain, feel with the fingers, listen with the ears. This method, carried out, greatly improves concentration and wonderfully trains the ear to listen to one's own playing. It also accustoms the hands to find the keys through the touch perception, rather than the eye; which is so very desirable when executing from notes.

When playing from the notes the eye should never be taken away, but steadily focused on them. The reason for this is very obvious, as there are so many things to watch. Besides, every time one looks away the location on the page, to a more or less extent, is lost. When teaching pupils sight reading it is very helpful to use a heavy cardboard fifteen by forty inches, extended over the keyboard by placing one edge under the fall-board. By so doing the hands are well covered, which greatly helps to overcome the temptation of looking down.

This plan causes the teacher a little additional work, but I am quite sure it is well worth the extra effort, as it develops more masterly musicians.

THE
CURWEN EDITION
IN AMERICA

The House of J. Curwen & Sons Ltd
is represented in U.S.A. by

GEORGE H. DOWS
1701 Chestnut Street, Philadelphia, Pa.

THE demand in America for the *Curwen Edition*, which includes so large a number of works of particular interest to American musicians, has led the publishers to appoint Mr. G. H. Dows, in Philadelphia, to be their agent. The better service and greater accessibility which this arrangement makes possible are there to be made use of, and all those who, out of either knowledge or curiosity, would like a better acquaintance with all that is best in English music, are urged to communicate with the American representative of the most famous and most significant of English Editions, The

CURWEN EDITION

WHAT THE VOCAL
STUDENT SHOULD KNOW

By NICHOLAS DOUTY

An Introduction to the Art of Singing, with Daily Exercises for All Voices Selected from the Works of the Great Masters of Singing.

Flush Cloth Binding, Price, $1.00

NICHOLAS DOUTY

Mr. Douty is well qualified to say "What the Vocal Student Should Know," being one of the foremost vocal teachers of the day and for years has held a high place as a concert and oratorio artist.

THE whole purpose of this book is to enunciate a few underlying principles, the common property of all voice users, in language of the utmost simplicity, avoiding as far as possible the use of technical terms. The various chapters of this concise guide to the vocal student include (1) Song and Speech; (2) Breathing; (3) Vowels and Consonants; (4) Resonance; (5) Mentality and Personality; and (6) "A Daily Dozen for Singers," including lyric soprano, dramatic soprano, contralto and mezzo-contralto, lyric tenor, baritone, basso cantante and bass.

Critics and Voice Teachers have given "What the Vocal Student Should Know" a Reception that is Most Gratifyingly Complimentary.

Mr. Douty justly thinks that too many books treat of the use of the voice as if it were a thing too mysteious to be understood by the masses.
VICTOR NILSSON in the MINNEAPOLIS JOURNAL

"Different" as well as written in a more interesting manner than others of the same kind that have preceded it.
S. G. BAUER in the BIRMINGHAM NEWS

A book that will be of great use and interest to vocal students.
EMIL ENNA in the PORTLAND NEWS

Mr. Douty is a clear thinker—the chapters in this book are interesting and easily comprehended.
MUSICAL LEADER

I am going to find this book useful, especially with young students and singers who do not know what they are about.
STANLEY PORTER TRUSSELLE
Skidmore College, Saratoga Springs, N. Y.

I must express my admiration for this mighty excellent and serviceable book.
FRANK PARKER, Utica Conservatory, Utica, N. Y.

It is concise and understandable. The "daily dozen" makes it doubly valuable.
LEWIS J. HOWELL
Noted Baritone and Teacher, Phila., Pa.

So good I want one-half dozen more.
GEO. KENNEDY, Tacoma, Wash

THEO. PRESSER CO. MUSIC PUBLISHERS AND DEALERS 1710-1712-1714 Chestnut Street PHILA., PA.

The Etude's Mail Box

Imagine a mail bag with more than a million letters! THE ETUDE publishers receive more than that during the year. Some of them are mighty interesting for our readers, and we are always glad to print a few.

Practicing with Paderewski

To The Etude:—

If we cannot have this wonderful pianist as a companion in our practice, at least we can have his spirit in our work.

We are told that Paderewski "thinks out every note of his program" the night before he is to play. Here is a hint that may save much of the drudgery of practice. The mind, soul and body do get so wearied by the endless repetitions so often indulged in when trying to master a difficult study or piece.

Try this plan.

Select a short group of notes or a phrase. Now collect every bit of the mind and concentrate it accurately, positively and definitely first on your ideal as to just how this should sound, and then on the exact motions that will be required to insure this effect. Hear it mentally and feel it nervously and muscularly several times; and then produce this at the keyboard. Repeat the formula. When this group is mastered, try another. Gradually the length of the passage thus treated may be lengthened till several phrases can be done at one time. Thus an immense amount of mental and physical fatigue is saved.

Hoping this may help some other one,
I am cordially yours,
Hulda Kitchell (Arizona).

Getting the Children to Sleep

To The Etude:

One of our neighbors has been telling how his wife "started in" to "read" his little son to sleep; and how, the longer she read, the more awake was the child.

This reminded me of the yesteryear of my two as live wires as ever breezed through a nursery.

When they were tucked away for the night, I used to go to the piano and sing. What? Any of the world-famous arias, such as "Ah, Perfido!", "Ah, fors e lui," "Als in Mitternacht gestunde."

The glory of this music seemed to strike these two little ones much at it did the more sophisticated audience at the opera. The beautiful climax of a song would come; I would feel the silence out in the children's room; I knew they felt with all the world. Oh, it was magnificent! Soon—silence; they had passed on to the dreamless slumber of happy childhood.

What wonderful joy young and old can get from good home music. Mothers, make yourself familiar with the best in the tone art. Begin when the children are two or three years old and let them grow up in an atmosphere filled with good music. Let them breathe the inspirations of the best masters into their young souls so that a taste for them will be their natural heritage.

Mrs. von Tetzel,
Wisconsin.

What I Heard at Vladivostok

To The Etude:

We arrived at semi-modern Vladivostok in the middle of January, 1919. The rather fine railway station was crowded with refugees; and though at such a time one would not expect much artistic activity, there were opportunities for hearing really good music.

One of these was by a Russian choir. An interpreter kindly explained the nature of each selection, previous to its rendition, else we could not have understood in the least. The voices, and especially the basses, were magnificent. There they stood in all kinds of nondescript garments and sang, and their work was beyond praise. One could not but compare them, at first, with the choruses in immaculate evening dress which are seen in our own country; yet all externals were soon forgotten in the enjoyment of the truly fine art which they presented.

It was the music of the Russian Church, of course; and one could not but feel and be impressed by its dignity and solemnity, colored by that unmistakable shade of melancholy which is such an oft-recurring and yet fascinating characteristic of Russian music.

Another entertainment was an orchestral concert given by Austrian prisoners. String and wind sections were well represented, and the instruments were handled with consummate skill. It was like meeting a familiar face in a strange land to hear again the strains of the "Peer Gynt Suite," which was rendered perfectly. One could scarcely realize that here were performers who, but a few days before, had been our active antagonists; though now, as it were, we were sitting at their feet and paying well-deserved homage. What a heartfelt throb of sympathy' music can awaken, even in antipathetic natures in a strange land!

The Russian, and many of the Allied soldiers who frequented the American Y. M. C. A., were very fond of music. To sit at the piano and play for a few minutes meant that one would be quite hidden by the crowd of listeners. Often we could converse only by signs; but a smile and a nod are the same the world over. The Russians and Czecho-Slovaks recognized many such things as the *Military Polonaise*, and would nod, smile and say *"Chopin."* When I, one day, had finished playing, one of the listeners brought something from the canteen for me to drink, to express the feelings he could not put in words.

H. C. Hamilton,
Canada.

Wants an Organization of 'Cellists

To The Etude:

I should like to see all the 'cellists organized into a guild, to make the instrument more popular among the masses. Most people know only the piano or violin. Perhaps one instrumentalist in ten thousand plays the 'cello.

A phonograph is found in almost every home, but in how many homes will you find a 'cello record? A few managers have 'cello artists on their lists, but there is less demand for them because the public in general is not acquainted with the beauties of this instrument that has a tone so near the quality of the human voice.

An organization of 'cellists would raise the standard of playing and create a demand for 'cello artists in the concert field. This would be to the advantage of all—commercially, industrially, artistically and to the publishers.

Nathan H. Alterman,
New York.

AN IMMENSELY POPULAR MUSICAL HISTORY—IDEAL FOR CLASS USE

Standard History of Music

A Text Book for Students of All Agents

By JAMES FRANCIS COOKE

Price, $1.50

A complete, concise, understandable, and authoritative series of lessons in the development of musical art, handsomely illustrated throughout. The work is so simple that any intelligent musical child of eight or ten should understand every word; so fascinating that older students are delighted with it. Everything is clearly explained as the work goes along. American music, modern music, and modern composers are adequately treated.

SUMMER CLASS REQUISITES

Excellent Text Books and Teaching Helps that are Ideal for Accomplishing Considerable in the Limited Time of a Summer Course.

Teachers may obtain any of these books for examination.

Catalogs covering any classification in music cheerfully sent upon request. Best discounts. Most liberal terms.

AN "IMMEDIATE SUCCESS" AND NOW THE MOST USED OF ALL HARMONY WORKS

HARMONY BOOK FOR BEGINNERS

Brief, Simple, Vital and Practical

By PRESTON WARE OREM

Price, $1.25

This book affords a thorough preparation for more advanced study by giving the main essentials of the subject, scales, intervals, common chords and the dominant seventh chord, in a simple, understandable and interesting manner. Rules, footnotes and cross references are dispensed with, everything being inserted in its logical place in the body of the text. Blank spaces are included, right in the book, for writing the exercises given.

Over a Million Pupils Have Studied With These Piano Methods

Beginner's Book

School of the Pianoforte, Vol. 1

By THEODORE PRESSER Pr., $1.00

Used more extensively than any elementary instructor. It takes the student, in a thoroughly delightful manner, through the first grade of piano study up to, but not including the scales.

Student's Book

School of the Pianoforte, Vol. 2

By THEODORE PRESSER Pr., $1.00

Takes up the subject where the *Beginner's Book* stops. In addition to the scales various phases of technic are exemplified in a manner that insures rapid progress.

Player's Book

School of the Pianoforte, Vol. 3

By THEODORE PRESSER Pr., $1.00

Presents pleasing study material arranged in progressive order, treating somewhat in detail, trills, octaves, two notes against three, the pedal and other matters necessary to technic.

Standard Graded Course of Studies

In Ten Grades *10 Volumes*

By W. S. B. MATTHEWS Pr., $1.00

This is the original, and in spite of imitators, still the one universally used course of piano study. It develops, when properly studied, technic of the best kind with a minimum of trouble.

For More Advanced Students

A SYSTEM OF HARMONY FOR TEACHER AND PUPIL

By JOHN A. BROEKHOVEN

Price, $1.00

This book has been used with much success in conservatory classes. It is a comprehensive work in which the subject is treated in a scholarly manner and contains splendid material for students who have mastered the elementary stages of theoretical instruction.

HARMONY

By H. A. CLARKE

Cloth Bound. Price, $1.25

A system of harmony, founded on key relationship, by means of which a thorough knowledge of the rules that govern the combinations and successions of sounds may be easily acquired. Different from other works on harmony in several important particulars, chief of which is the discarding of the figured bass, the pupil working from the melody, the natural way, from the beginning. The various subjects follow in logical sequence. Modulation is treated in a clear, easily comprehensible way.

SIGHT SINGING CLASS SUGGESTIONS

Graded Studies in Sight Singing

By GUSTAV VIEHL Price, 75c.

A complete, comprehensive and up-to-date sight singing method. While the course in this book is presented in a serious phase, it is by no means dull or uninteresting. The very start of sight singing, as well as the more intricate stages, are covered in this work. Sight singing is the basis of all musical education.

Methodical Sight Singing

By F. W. ROOT, Op. 21 Three Bks. 60c. ea.

Part 1—Methodical Sight Singing
Part 2—Through the Keys
Part 3—Progressive Musicianship

An excellent system, beneficial to students in singing or instrumental music, since it brings about a proficiency in musicianship, perfecting sight reading and giving an understanding of music that is as important as developing technic or vocal dexterity and artistry.

A New Work for Juvenile Classes

MUSICAL COMPOSITION FOR BEGINNERS

By ANNA HEUERMANN HAMILTON

Price, $1.00

The most noteworthy offering in recent years to the progressive teacher. From the simplest possible beginning it introduces the pupil to the fascination of "really truly composing," a previous knowledge of harmony being unnecessary. Nothing is better calculated to further the musical intelligence of pupils.

Material for Strengthening and Modernizing Piano Teaching Systems

FIRST GRADE SERIES

By L. A. Bugbee Catalog No. 7718 Price, $1.00

An unusually popular and interesting set of first studies for young pupils. A number of these studies have accompanying text and in general these studies are so nearly like little pieces that the pupils "take" to practicing them. A set of studies such as these can be used to good advantage in conjunction with any elementary instructor.

GENERAL STUDY BOOK

By Mathilde Bilbro Price, 75 cents

The useful is mingled with the entertaining in this work. There are studies interspersed with short pieces containing words and they are strictly first grade. Throughout this is a charming set of easy piano studies.

THE PIANO BEGINNER

By Louis G. Heinze Catalog No. 9651 Price, 80 cents

A compilation of exercises in progressive order and intended for the beginner who has mastered the rudiments of music. These easy studies have been selected chiefly from the works of standard masters.

THE FIRST TWELVE WEEKS AT THE PIANO

By R. C. Schirmer Catalog No. 17581 Price, $1.00

A work that represents the excellent instruction ideas of a finely trained teacher who had one of the leading Philadelphia conservatories for many years. The studies are short and thoroughly practical.

SECOND GRADE BOOK OF MELODIC STUDIES

By L. A. Bugbee Catalog No. 13041 Price, $1.00

A teacher can find use for these studies with almost any second grade pupil. Pupils welcome a change from the best of instruction books and these attractive study pieces serve that purpose. The success of this set of studies has been phenomenal.

ETUDES FACILES

By Albert Franz Catalog No. 17671 Price, $1.00

These studies start in the second grade and progress into the third grade. They are melodious and of great technical value. They really give new, fresh material to take the place of such a set of studies as Streabbog Op. 63.

TWENTY PROGRESSIVE STUDIES IN THE SECOND GRADE

By M. Greenwald Catalog No. 16920 Price, $1.25

Easy, melodious studies that are very helpful to young students. They are in a characteristic vein, most of them being like little pieces.

TWENTY-FIVE MELODIES FOR EYE, EAR AND HAND TRAINING

By Mathilde Bilbro Price, 75 cents

These may be regarded as second grade studies. They are intended to establish the position of the hand upon the keyboard, attaining freedom, training the eye, especially in the leger-lines, in staff positions and cultivating a musical ear.

TEN STUDIES ON A GIVEN THEME

By Herbert Ralph Ward Catalog No. 17831 Price, 60 cents

A set of easy velocity studies (grade 1-2) that will aid in familiarizing the student with all keys in the major mode.

TIME STUDIES

By Sidney Steinheimer Catalog No. 13356 Price, 80 cents

Very useful studies in which all sorts of time and rhythm problems, such as triplets, syncopation, two against three, dotted notes, etc., are presented. Grade two.

PEDAL BOOK

By J. M. Blose Price, $1.00

A valuable offering giving a systematic course of study of the pedal. Intended for the primary and intermediate grades and designed to meet the wants of the average student.

THIRTY-SIX SHORT MELODIC STUDIES
WITH SPECIAL CONSIDERATION OF THE PEDAL

By Felix Smith Catalog No. 2683 Price, $1.00

A set of studies in grades two and three that teachers find very useful. The attention given to the pedal at this stage of study is too often neglected and these melodic studies take care of the pedal in addition to their technical value.

INTRODUCTORY LESSONS ON THE ART OF POLYPHONIC PIANO PLAYING

By Theodore Presser Price, 75 cents

A definite course on polyphonic or part-playing commencing from the very beginning. There is no better mental drill than that offered by such studies as these. They may be given to a pupil well along in the second grade and will serve to correct many of the faults that cause a lack of charm to the student that has been drilled on only studies of a mechanical nature.

RHYTHM AND TECHNIC

By M. Greenwald Catalog No. 13932 Price, $1.25

Early grade studies of a melodious nature designed for special purposes. Each is devoted to some special feature, such as double notes, wrist work, repeated notes, velocity, staccato, embellishments, etc. Grades 2-3.

INTERPRETATION STUDIES

By Franz C. Bornschein Catalog No. 15246 Price, 80 cents

Studies intended to incite the pupil's imagination and through their use bring forth an elemental degree of æsthetic quality. They are for the junior (second and third) grades.

Any of the Study Material On This Page May be Successfully Used in Conjunction With These Successful Teaching Courses

BEGINNER'S BOOK
SCHOOL OF THE PIANOFORTE, VOL. 1

By Theodore Presser Price, $1.00

A truly **Beginner's Book** in every sense. Teachers have achieved speedy results with even the youngest beginners through using this elementary method. This is the first volume of a most successful **School for the Pianoforte.** The second volume, STUDENT'S BOOK, is equally popular and in response to numerous demands a third volume which gives promise of enjoying the same success was produced. The third volume is entitled THE PLAYER'S BOOK.

STANDARD GRADED COURSE
OF STUDIES FOR THE PIANOFORTE

By W. S. B. Mathews

In Ten Volumes Ten Grades Price, $1.00 Each

The greatest educational work of the age. A complete course from the very beginning to the highest degree of virtuosity. This original graded course gives standard material for study purposes selected from the best composers. This course has been the "main trunk of the tree" in the music study of hundreds of thousands of pupils.

FIRST STUDIES IN OCTAVE PLAYING

By Theodore Presser Catalog No. 14590 Price, 80 cents

Studies that pupils in the second and third grade may take up. This work was carefully prepared and the result is an unusually fine teaching offering for the first octave playing at the keyboard.

EXERCISES IN DEVELOPING ACCURACY

By Gustav L. Becker Catalog No. 12952 Price, 80 cents

There are few who do not need studies of this character. Many teachers even would find these studies a great help to their technic. They are thoroughly practical and while some of the studies might be graded as intermediate, others run up to the seventh grade.

CONCENTRATED TECHNIC

By Alois F. Lejeal Catalog No. 11139 Price, $1.00

Pupils who are fairly advanced may be given this work which gives exercises condensed according to modern principles and including every phase of technic. Grades 4-6.

THE NEW GRADUS AD PARNASSUM

By Isador Philipp In Eight Books Price, $1.00 Each

An academic course of selected studies. The entire offering of educational piano literature was ransacked in order to select the best possible material for each phase of technic treated. The studies in each part are arranged in logical and progressive order covering grades about four to six.

Book 1	**Left Hand Technic**	**Catolog No. 8690**
Book 2	**Right Hand Technic**	**" " 8691**
Book 3	**Hands Together**	**" " 8692**
Book 4	**Arpeggios**	**" " 8693**
Book 5	**Double Notes**	**" " 8694**
Book 6	**Octaves and Chords**	**" " 8695**
Book 7	**The Trill**	**" " 8696**
Book 8	**Various Difficulties**	**" " 8697**

HAND CULTURE

By Anna Busch Flint Catalog No. 7906 Price, $1.00

A system of double-note finger training. They are designed to develop the fingers to equal strength. The ideas embodied in these studies are based on physiological laws. Grade 6.

TEN BRILLIANT OCTAVE STUDIES

By A. Sartorio Op. 1044 Catalog No. 11480 Price, $1.50

Sartorio has several sets of octave studies that may be used to precede this group and with these, this group completes a thorough course in octave playing. These studies are musical and are just right for advanced pupils around grades six to eight.

MASTERING THE STUDIES AND ARPEGGIOS

By James Francis Cooke Price, $1.50

Complete treatment is accorded scales and arpeggios in this volume. With this work the teacher is enabled to start scale study with very young pupils and carry it on to the highest degree of proficiency as they progress and become advanced students.

L'ART DU CLAVIER—THE ART OF THE PIANO

By Theo. Lack Op. 289 Price, $1.50

There are exactly one hundred short exercises covering all the various phases and difficulties of piano technic, in this volume. The idea of artistic piano playing is not forgotten throughout. Pupils may take up these studies after two or three years of study.

FINGER GYMNASTICS

By I. Philipp Op. 60 Price, $1.50

Moderately advanced players should use these finger gymnastics over a number of years, in fact, they are just the type for the pianist's daily use. Here is an excellent work that is a decided departure in the completion of finger work in extension.

Teachers! You May Secure Any of These Works for Examination at Your Leisure in Your Own Studio. Order Now for Fall Needs.

Do You Invest an Hour a Day in Summer Reading?

Someone who makes a specialty of tabulating statistics found out that far more people read in Summer than in Winter. This is particularly true of the temperate zone. In January and February so much of our bodily energy is consumed in just keeping warm that we take little time for reading. But, oh, the joy of a book that we are interested in on one of those Summer days when it is a real pleasure to indulge ourselves. You owe it to yourself to feed your brain and ambitions with good stimulating instructive books one hour a day during the summer. One hour a day in Summer will make you a master of almost any book subject you may elect to take up, if the work is not too advanced for you. If you have longed to study musical history, musical theory, musical interpretation, there are a number of excellent works that thousands of others have used for Summer reading, to be found in this issue. If you don't want to read printed text, read music. Buy a collection of good music albums and play them through daily. Get pieces within your grasp and have a real good time at it.

Etude Cover Design Contest

Every month for years we have striven to have an attractive Etude cover design. The supply of material for good Etude covers is very limited indeed. When you see a cover that you do not care for, please remember the restrictions under which we have to work.

In order to stimulate artists in helping us to make successful covers you will find elsewhere in this issue our Etude Cover Design Contest announcement. The prize is $250.00 and the contest closes Sept. 1st, 1924. Please read the details carefully and do us the favor of informing your friends who have talent in drawing and in designing.

We have had contests of this type before and have secured good covers, often arranging for the purchase of those which have not won the first prize.

A Technical "Brush Up" For Teachers

Many piano teachers take advantage of vacation period to "brush up" their individual technic. For this purpose there are many excellent works, among which we can particularly recommend the following: Isidor Philipp's "Finger Gymnastics," designed for the daily use of moderately advanced players; A. B. Flint's "Hand Culture" for double-finger training, strengthening the weaker fingers and aiding in the mastery of technical difficulties; G. E. Becker's "Exercises for Developing Accuracy," a thoroughly practical work; Isidor Philipp's "Complete School of Technic," the ideal compendium of modern technic and one of the outstanding works of its class, invaluable to teachers and advanced students; many special phases of piano technic are covered in a modern manner in Theo. Lack's "L' Art du Clavier." The entire set of five will be found useful for the teacher as well as for the student.

Summer New Music

The response to our notice offering to send new music (vocal and instrumental) to our patrons during the summer months has been very gratifying; in fact, has exceeded our expectations. To those teachers who have failed to take advantage of this most liberal offer, we still extend the same privileges, and will gladly list their names among those who are now reaping the benefits of this service. This music is sent "on sale" each month during the summer, with the understanding that the teacher may select any material desired and return the balance at the end of the season. Our regular patrons should understand that it will be necessary to notify us if this service is desired. A postal card will start these packages coming to you, a postal card will stop them.

Pedal Studies for Organ By Ernest H. Sheppard

This new set of *Pedal Studies* would make a very good preparation for the more difficult ones by Schneider. These latter are used almost universally, but the student must be pretty well along before they can be taken up. Any student who has completed Whiting's *Beginners' Organ Book*, for instance, or Rogers' *Graded Materials*, or Stainer's *The Organ*, can use to advantage Mr. Sheppard's *Pedal Studies*. Each study is in a different key and is preceded by the pedal scale written out in full and with the correct pedaling given.

The special introductory price in advance of publication is 30 cents per copy, postpaid.

Six Study Pieces for the Development of the Wrist By Carl Moter

This work, which will be issued in a short time, has given us great pleasure to accept. It covers a place in the development of every piano student which is neglected to a very large extent at the present time. This is the matter of wrist technic. These studies while they are called wrist studies, are nevertheless in various styles introducing staccato notes, thirds, sixths and a few octaves. They are delightful musically, and are more like pieces than studies. We feel confident that teachers taking advantage of this advance offer will be pleased.

Our advance of publication offer is 25 cents per copy, postpaid.

Self-Help Material for Get-Ahead Students

One of the leading articles in this issue is possibly the best "Self-Help" article we have seen. Anyone with what they used to call "way down East" *gumption* can take this course and make splendid progress. In it is listed a number of the very best things obtainable for self-help. We can supply any of this music and all of the Brunswick and the Victor records listed at the very lowest prices. If you are one of the thousands "who never seem to get ahead,"—if you think that you have come to a place where you have "run up against a stone wall,"—just pick out of this article the material that seems to hit your case best and put in your very best efforts upon it this summer. You may not do as much as you would with a good teacher; on the other hand, by dint of extraordinary efforts, you may be able to do more. In any case, you can put yourself in stronger position for better work when the chance to have a fine teacher does come along.

Glee Club Songs for High School and College By Hollis Dann and W. L. Wood

This is a work which was published some years ago in two volumes. We are bringing out our edition of these works in one volume, thereby eliminating a few of the undesirable numbers The work is suitable for the average chorus of men, and especially so for use in high schools and colleges. Most of the numbers are original and quite a number are arrangements of well-known songs, such as *Drink to Me Only With Thine Eyes, Sweet and Low*, by Barnby, and *Old Folks at Home*, by Foster, arranged by W. L. Wood. The collection all told is a happy one, and we look forward to a long life for this volume. Only one copy will be sent at the special offer. The work will be in advance of publication but a short time as the plates are already made.

Our special introductory price in advance of publication is 40 cents per copy, postpaid.

Tunes for Tiny Tots By John M. Williams

This little book is designed to be used in kindergarten work or to prepare very young students for their first instruction book. It begins in the most elementary manner, and yet at the same time things are presented in such a way as to make study attractive to the young pupil. The book is in oblong form and an extra large note is used throughout, making everything easy to perceive and understand. Each of the little studies or pieces has an appropriate rhyme which aids in appreciation of its rhythmic character. All this is in line with Mr. Williams' own advanced ideas in musical pedagogy.

The special introductory price in advance of publication is 30 cents per copy, postpaid.

Organ Score Anthem Book No. 2

This is a collection of anthems for the average choir in the smaller places and for which there is a constant and growing demand. It contains a great variety of church music by the best writers for volunteer choirs. There are about seventy selections in the work, including music for all occasions, Christmas, Easter, Thanksgiving Day and other festivals. These selections have never been published in any other book. They are written in organ score; by this we mean there are two staves for the four voices and in this way there is a great deal of space saved. In most anthem publications each voice has a separate staff besides an organ part, making six staves in all, whereas, in the case of the organ score work there are only two staves. Exceptions are made where solos are used when these have an independent organ part and where parts are independent. The most difficult number in the work is the undying *Gloria* from the *Twelfth Mass*, by Mozart. Nothing better can be found for a volunteer choir.

Our special advance of publication price is 35 cents per copy, postpaid.

Reflections For Music Students By Sidney Silber

Mr. Silber is known to Etude readers by his numerous contributions to this journal. He is the dean of the Sherwood School of Music of Chicago and in his varied musical experience as a pianist and as a teacher he has set down a number of paragraphs designed to help others—particularly students. In the early years of the history of this magazine there was a column of reflections known as "The Wisdom of the Many." These maxims or reflections were eagerly read and there is little doubt that many a one of them has turned the career of the reader successward. We are confident that Mr. Silber's pointed paragraphs will help many. The introductory, advance of publication price of this book is 50 cents, postpaid.

The Promised Child Christmas Cantata For Mixed Voices By R. M. Stults

The story in this cantata is put in a new manner. The "Coming" is the theme and is carefully worked out by the prophecies down through the events immediately before the birth of Christ. The solo "Let Us Now Go Even Unto Bethlehem" is placed next to the last number which is a splendid finale for full chorus. The time required for rendition is about 40 minutes. There are solos for each voice with lovely melodic passages which are so much the gift of Mr. Stults. There are no difficulties in the music to lift it out of the reach of the average choir and yet the charm of it renders it worthy of serious study and preparation. Our advance of publication offer, at which one copy only may be obtained, is 30 cents, postpaid.

The Awakening Christmas Cantata For Treble Voices By William Baines

A cantata for Sopranos and Altos only, no Tenor nor Bass parts. There are some short solos which may be done in unison. The tunefulness of this cantata makes it suitable for adults or girls, and also boys with unchanged voices. The music is very easy but there is sufficient change of tempi and variation in the accompaniment to render the entire work most interesting. Various parts may be omitted if it is considered too long. The splendid success of *The Dawn*, Mr. Baines' Easter Cantata written for the same voices convinces us we have something much desired by our patrons. The time required in rendition is about twenty-five minutes. Our advance of publication offer for one copy only is 25 cents, postpaid.

Rhythms for Young People By Blanche Fox Steenman

This book is first and foremost a manual of musical appreciation. While its original intention is to bring to the mind of young students the various musical rhythms and their classifications, this is done by the aid of the best possible examples in each particular class. The book contains an extraordinary amount of standard material, just the pieces which are heard most and with which the budding music lover should become most familiar.

The special introductory price in advance of publication is 50 cents per copy, postpaid.

The Cat Concert By Russell Snively Gilbert

This is one of the many really good first grade sets of teaching pieces that are being added to our catalog from time to time. It is very convenient to have a number of these short pieces grouped together in one volume, and if they are all on the same subject, so much the better. *The Cat Concert* is a quaint conceit in which the cats march in, the old professor intones a chant, the prize cat fiddles, the black kittens play a trio, the kitties dance and the moonlight glee club obliges; a very attractive set.

The special introductory price in advance of publication is 35 cents per copy, postpaid.

New Theory Book
By Preston Ware Orem

This work is a *New Theory Book*, in that it is concerned with the facts underlying musical structure and their practical application. In music the term "Theory" is, in a more general way, applied to all branches of composition. In this book it more particularly applies to "elementary composition" and everything in connection with it. The student who has learned so much of harmony, covering the use of the common chords and the dominant seventh chord, can take up this new theory book at once and go right into practical composition; employing in his work not only all the knowledge so far attained, but also gaining additional harmonic knowledge as it is required in the work that he is doing. In this book the student learns the *whys* and *wherefores* of composition from the ground up.

The special introductory price in advance of publication is 60 cents per copy, postpaid.

What to Play—What to Teach
By Harriette Brower

Miss Brower's experience has been wide and thorough. At one time she was a pupil of von Bulow. Since then she has known a great many famous teachers and pianists and has consulted them upon just the subject of this book. What Miss Brower has done in this work is simply this: She has started at about the third grade and has made out programs for imaginary recitals, picking out the best music for that grade and then describing each piece so that the teacher who desires to extend her list of teaching pieces and the student who desires to extend her repertoire may have the advantage of her advice. The introductory advance price upon this work is 75 cents, postpaid.

Notturno—
A Musical Romance—
By Carl Schmidt

This work will be continued on special offer during the present month. It makes an excellent work for vacation reading. There is a very great dearth of novels on musical themes. Most of the musical novels have a very slight bearing on music but Mr. Schmidt's novel is entirely musical. It is something similar to the *Kreutzer Sonata*. We expect to have this work ready before the summer is over. This work will be bound in cloth and will sell for the usual price of cloth bound volumes.

Our advance of publication price is 80 cents per copy, postpaid.

Basic Principles in Pianoforte Playing
By Josef Lhévinne

This book, which will be issued in a few weeks now at the latest, is not a tome in size but its import is very important to teacher and to student alike. Mr. Lhévinne, in conjunction with a well known educational writer, prepared these chapters with a view to pointing out in the clearest possible terms certain things which are indispensable to musical pianoforte playing. He puts the whole subject in such a simple manner and tells definitely how to accomplish certain results which must inevitably bring beauty and charm to your playing. By purchasing this work you may be able to improve your tone and your technic 100 per cent., if you do not already know its secrets. The advance of publication price is 30 cents, postpaid.

Reverie Album
For the Piano

This is a collection of drawing-room pieces of the quieter and more refined type. It is a book which might be used for Sunday playing or at religious meetings where a piano is used. It will also prove a good book for general use. The list of contents comprises chiefly pieces in the styles of *Songs Without Words, Reveries, Nocturnes, Meditations*, etc. Modern and contemporary writers are represented chiefly. These pieces have not previously appeared in any other volumes.

The special introductory price in advance of publication is 35 cents per copy, postpaid.

Little Folks' Music Story Book
By James Francis Cooke

Frankly, this is a history—a history of music for the very "littlest" folks. The illustrations are printed upon separate sheets ready to be cut out by the child and pasted in the book as the lessons are given. Many new and charming features have been introduced. It is one of those things difficult to describe, but of a kind that would make you want to have it at once if you saw it in a store. It has been in preparation for some time, all of the text is now complete and the pictures are being selected. The advance of publication price is 50 cents per copy, postpaid.

Principles of Expression in Pianoforte Playing
By A. F. Christiani

If this book had been called "How to Play the Piano" the title might be more appropriate. It is not a book that teaches technic, but it gives what technic does not give. It tells how to make your playing beautiful by giving you an understanding of the inner meaning of phrasing, accent, rhythm, meter and nuance. This is done by practical example. For instance, in one part a complete Chopin Nocturne is analyzed, note for note, in such a way that you can apply the same principles to any other piece. This book was originally published at $3.50 per copy. We are reprinting it now from the same plates. Until the new edition comes out you may order your copy in advance at $1.50, postpaid, or less than half the original price. Of course this is purely an introductory price and the price will be increased immediately the new edition is out.

Music Writing-Book
By Anna Heuermann Hamilton

This work has been on special offer for some time, but it is now entirely engraved, corrected and re-corrected, and we positively expect it to be on the market before the next issue, so it can be used for the fall teaching. We would advise those not having taken advantage of the advance offer to do so during the present month. This work is the best Writing Book that has ever fallen into our hands, more complete, modern, and containing features found in no other writing book. There is no other book required to go with it, as all the examples can be written out on the blank pages of the work itself. It is the work of one of our most advanced educators, and cannot fail to find a place in the curriculum of studies for musical education.

Our special advance offer is 20 cents per copy, postpaid.

Album of Scales
for the Pianoforte

This new volume in the series "Study Pieces for Special Purposes" is now nearly ready. This volume is devoted to *Scales*, whereas, the first volume of the series was devoted to *Trills*. The book is about the third grade in point of difficulty and it contains a varied assortment of pieces and study pieces, each one based upon passages derived from the scales. Such composers as *Heins, Spindler, Greenwald, Behr, Spaulding, Lichner* and *Wachs* are represented. Such books as these tend to make practice interesting and to bring about technical proficiency without undue labor over dry material.

The special introductory price in advance of publication is 30 cents per copy, postpaid.

Holberg-Suite for Piano
By E. Grieg, Op. 40

Our new edition of Grieg's *Holberg Suite* is now on press. This edition has been prepared very carefully, revised and fingered. All of the five numbers constituting this suite are used in teaching and recital work. The *Prelude* is especially valuable. This *Opus* will probably prove to be one of the most enduring of Grieg's efforts in composition. In point of difficulty the various pieces would lie in grade five.

The special introductory price in advance of publication is 25 cents per copy, postpaid.

The Vision of Deborah—
A Sacred Cantata
By Richard Kieserling

Cantatas for special seasons of the year and for particular occasions are numerous, but it is seldom that one finds a cantata which is suitable for all seasons and yet sufficiently festive in character to be performed at special musical services. *The Vision of Deborah* is dignified in character and in proportions. The story is taken from the well-known episode as told in the *Book of Judges*. There is some splendid chorus work throughout, not too difficult and varied in coloring. There is also plenty of work for a quartet of capable soloists. The work has an effective organ accompaniment.

The special introductory price in advance of publication is 30 cents per copy, postpaid.

Jolly Jingles For Little Fingers
By Helen L. Cramm

This little work is very nearly ready but the special offer will be continued during the current month. Young students of to-day are fortunate in the wealth of material which is offered for their instruction and delectation. Instead of the cumbersome instruction book of old, a short and practical beginners' book is used nowadays and is supplemented by all sorts of attractive pieces and sets of pieces. Miss Helen L. Cramm has been especially happy in the preparation of material of this nature and has had many successes. *Jolly Jingles* is her newest book. It is full of melody and character. The pieces are of the first grade.

The special introductory price in advance of publication is 30 cents per copy, postpaid.

Pageant of Flowers
Operetta For Children
By Richard Kountz

Groups of children, singing, talking or dancing, with garlands of flowers swinging and a stage covered with many colored blooms—a pleasing entertainment! The story of a sick child, now recovered and whose many virtues and lovable qualities are expressed by certain flowers gives a strong moral tone to the play.

For a short half-hour the beauty of the picture increases until in the final tableau the scene becomes a riot of color. The staging is very easily done and may be quite inexpensive. The music is distinctly original and good, but the sort children like and so, very quickly memorized. The advance of publication price for one copy is 35 cents, postpaid.

Thirty-six Studies or Caprices for Violin
By F. Fiorillo

These studies have for many years been recognized as among the most important in the development of violin technic, and in keeping with our policy of publishing only the best, we are getting out an excellent new edition of this work. The editing is being done by Otto Meyer, Sevcik's assistant and successor in this country, and we are sure this volume will be a very valuable addition to the Presser Collection. The wideawake teacher who desires the best in teaching material will be sure to take advantage of the special introductory price of 35 cents, postpaid. The regular retail price of the book when published will be $1.00.

Short Term Subscriptions

For the months of June, July and August we are offering to new subscribers a three months introductory subscription to the Etude Music Magazine at the net price of 35 cents. The opportunity for your musical friends to become acquainted with the Etude is presented to them at very little expense and we will appreciate it if you will bring the offer to their attention. If the new subscriber wishes to continue the subscription after having received the three summer months we will be glad to extend the courtesy of a full year's subscription for the additional price of $1.65.

(*Continued on page 504*)

The World of Music

(*Continued from page 441*)

Louis Victor Saar has won the three hundred dollar prize offered by the United Male Choruses of Chicago, for American Folk-songs, in honor of the Diamond Jubilee of the North American Saengerbund.

The Wisconsin Music Teachers' Association held its annual convention at Steven's Point, April 29-May 1. It was an unusual meeting in both attendance and enthusiasm.

Sir Edward Elgar, generally considered the foremost of living English composers, has been appointed to the post of "Master of the King's Music." He is the most distinguished person who, for many years, has been appointed to one of these quasi-sinecures of the royal household.

The Society for the Publication of American Music will receive original compositions by American composers, up till October 15, for consideration for their awards for 1924. Particulars from W. B. Tuthill, 185 Madison Avenue, New York.

The Capetown Orchestra, Mr. Theo. Wendt, conductor, finished a very successful season at Johannesburg on May 13th. Dvořák's "Stabat Mater," Mendelssohn's "Elijah," Beethoven's "Ninth Symphony" and the Afrikanse Mannekoor in Brahm's Rhapsody for alto solo, male chorus and orchestra, were choral works given during this time. A hearty hand to musical South Africa.

A Conservatory for Jewish Music is to be established in Palestine as a memorial to soldiers who lost their lives in the World War.

The Chautauqua Assembly and Movement this year celebrates the fiftieth anniversary of these activities, at Chautauqua Lake, New York, during July and August. The itinerant Chautauqua has furnished a great uplift to American music, especially by the bringing of a better class of this into the smaller communities.

The Theodore Thomas Memorial recently unveiled in Grant Park, Chicago, bears the following inscription written by Paderewski: "Scarcely any man in any land has done so much for the musical education of the people as did Theodore Thomas in this country. The nobility of his ideals—with the magnitude of his achievement—will assure him everlasting glory."

The Norwegian Singers' Association of America held its Sixteenth Biennial Song Festival at St. Paul, on June 27th-29th. A male chorus of fifteen hundred voices, assisted by the St. Paul Symphony Orchestra, was directed by Frederick Wick, of Sioux Falls, Iowa.

The Johnstown (Pa.) Opera Company has given productions of "Cavalleria Rusticano," "Faust," and "Il Trovatore." Here is enterprise for a comparatively small community, which but proves that grand opera need not be confined to metropolitan centers, if only the right spirit is awakened.

The J. Fischer & Bro. music house of New York celebrated its sixtieth birthday on April 4th. It has had an honorable record in musical activities and has been of especial service in the bringing out of organ compositions.

The Annual North Shore Festival was held during the week of May 26th at Evanston, Illinois. Mendelssohn's "Elijah," with a chorus of one thousand voices and the Chicago Symphony Orchestra, was the outstanding feature.

Mme. Eugenie Pappenheim, one of the greatest of the Wagnerian singers in the early efforts to establish that master's works in America, died in Los Angeles early in May.

Pierre Monteux' engagement as conductor of the Boston Symphony Orchestra, has been completed. On every hand he was made to feel general appreciation of his work. At the final concert, of which Beethoven's Fifth Symphony was the leading feature, the members of the orchestra presented to M. Monteux a silver punch bowl.

The British Music Society (National and International) met for its Fifth Annual Congress, at Liverpool, June 24th-28th. Among the questions for consideration were, "The Amateur in Opera," "Necessity for a Musical Adviser in all Education Authorities" and "The Value of Musical Criticism." Sir Hugh P. Allen, Eugene Goosens, Frederick Austin and Herbert Antcliffe were among those to lead in the discussions.

Bulletin of the Presser Home for Retired Music Teachers

On the evening of May 1st the Home members were furnished a unique entertainment by a group of ladies from a near-by Baptist Church, who gave a minstrel performance and play which amused the audience throughout the evening.

On Wednesday evening, May 28th, we had a treat in the form of a musical program under the direction of Mrs. Helen Acroyd-Clare. The artists, from the Philadelphia Music Club, were Augusta Bispham Witherol, soprano; Edith Wells Bly, pianist; Oscar Langerman, violinist; Helen Acroyd-Clare, contralto; and Grace Acroyd-Rowe, accompanist.

Our Club has now adjourned its activities for the summer and wishes at this time to express its appreciation of all who have rendered services in our behalf throughout the year.

The Fairies' Revelry Operatic Cantata

By Richard Kieserling

Three-part choruses for treble voices with a soprano soloist render this a most charming as well as most useful short cantata. It requires about a half an hour in rendition and may be used as a part of any program.

The tonal pictures are so contrasted that the interest never abates. The fact that the Cantata may be acted while it is being sung lends additional value. The acting and staging is very easy and is fully described in the score.

There is a something about the music of Mr. Kieserling which appeals inevitably to the people whom he has in mind and in this cantata he has been truly inspired. Special advance of publication price for one copy only is 30 cents.

Advance of Publication Offers Withdrawn

The advance of publication price is withdrawn on four new works this month. These works are now ready for delivery and teachers have the opportunity of securing them for examination if they so desire. Those who ordered copies in advance of publication will find that they have received exceptionally meritorious works at bargain prices. The works being withdrawn are:

First Year at the Piano, by John M. Williams. This work was offered in advance of publication as the "New Instruction Book." This is a practical instructor utilizing attractive material, one of the features of the book being that it begins at once with both clefs. The retail price of this book is $1.00.

Amateur Musician, by Russell Snively Gilbert: A book of little exercises designed to develop the creative side of musical study. It aids in promoting a good working knowledge of the rudiments, stimulating the musical rather than the technical side of the beginner's work. It may be used as a supplement to any primary instructor. The retail price of this book is 75 cents.

First Lessons in Bach by Walter Carroll: A new and carefully prepared edition of a popular compilation of the easier numbers composed by Bach. This book may be used to precede the *Little Preludes* of Bach, being practically a first beginning in Polyphonic Playing. Teachers will do well in specifying this new edition in the "Presser Collection" when ordering this desirable little compilation of Bach's teaching works. Price, 75 cents.

The Castaways—Operetta for Women's Voices—by Fay Foster: The musical work of this operetta is melodious and charming throughout. The story utilized is interesting and a fine evening's entertainment is provided. It can be staged easily, yet at the same time making a setting and costuming attractive to the eye. Those interested in a work of this character for use next fall would do well to examine "The Castaways" now. The retail price of this operetta is $1.00.

Premium Workers

An exceptionally attractive lot of premiums is offered on the inside back cover of the ETUDE this month. If you have not already engaged in the fascinating game of securing rewards for new ETUDE MUSIC MAGAZINE subscriptions, now is the time to try. It is not difficult to secure a subscription from a music loving friend if you will explain the entertaining and educational features of our publication. The reward is far in excess of the effort involved.

We wish to add below a few additional premiums which are really worth while and for which we did not have space in the regular advertisement:

Dinner Set, 42 pieces. There are various attractive patterns but the most popular set is the Colonial, the same as used by your ancestors. Colonial china is a true reproduction. It is daintily decorated and not too heavy to appear clumsy. We will be glad to ship any one of these sets securely packed from the factory for only 13 new subscriptions.

Prim Lady Art Leather Shopping Bag. It is big and roomy (size 14 x 15 in.), carefully made, strong and durable, lined handsomely with flowered cretonne. Something out of the ordinary. The entire bag reflects good taste and is ideal for shopping, or as an over-night bag. Given for only one new subscription.

Water Proof Rubberized Kitchen Apron, Dainty gingham design. We have offered these to our friends for many months and they have always given perfect satisfaction. If you have never used one, you will wonder how you got along without it. Only one new subscription.

Wizard Closet Garment Hanger Set, 9 in. rack with four folding hangers, open 16 in. but can be closed up to 9 in. and slipped into the handbag. You need this on your vacation trip. It saves wrinkles. Only 2 new subscriptions.

Necklace, Indestructible pearl 24 in. long. Will not peel or discolor. Five new subscriptions.

Amber Bead Necklace, 23 in. long. Two new subscriptions.

Warning

Do not pay any money to strangers on ETUDE subscriptions. There is a gang of criminals working around Pittsburgh at this time and we have had many complaints from our musical friends who have paid out good money and can never hope to recover. Any honest subscription magazine representative will be glad to prove his worthiness to you.

"THE student who goes to a teacher and imagines that the teacher will cast some magic spell about him which will make him a musician, has an unpleasant surprise in store for him."—DE PACHMANN.

The August Issue of THE ETUDE will be exceedingly interesting!

In it will be discussions by leading authorities upon "THE JAZZ PROBLEM." Large printings of recent issues of THE ETUDE have been exhausted quickly. Those desiring to secure the August issue should place an order early with a dealer or the publishers.

Suggestions for Entertainment Features in Outdoor Affairs

ENTERTAINMENT MATERIAL THAT WILL ENHANCE GARDEN PARTIES—LAWN FETES—CARNIVALS—PLAYGROUND EXHIBITIONS SUMMER SCHOOL AND CAMP ACTIVITIES

MOTHER GOOSE FANTASY
For Soprano Solo and Two-Part Chorus
By Arthur Nevin Price, $1.00

The chorus parts are written for soprano and alto and, while these two-part choruses can be rendered by young people from 8 to 18 years of age, the work is worthy of any first-class young ladies' chorus. Solo dances can be introduced effectively if desired. Orchestral parts may be rented.

FROM THE YELLOWSTONE
A Musical Drama
for Solo Quartette and Chorus
Drama by Chas. O. Roos and Juanita E. Roos
Music by Thurlow Lieurance
Price, 75 cents

The wonders of the great outdoors with all its soul-inspiring beauties, are brought out by the drama and the music.

GHOSTS OF HILO
Hawaiian Operetta for Young Ladies
By Paul Bliss Price, $1.00

Here is a bright, tuneful musical play with a fascinating, mysterious plot. There are three sopranos necessary for the solo parts and there is one other main character, having a speaking part only. The two-part chorus work is not difficult, but is especially beautiful. Orchestral parts may be rented.

It is never difficult to make selections from the Presser Catalog. Liberal examination privileges granted.

THE CRIMSON EYEBROWS
A Musical Comedy in Three Acts
By May Hewes Dodge and John Wilson Dodge
Vocal Score and Dialogue, Price, $1.00
Stage Manager's Guide, Price, $1.00

This is a fantastic romance of old China, the scene being a garden of the royal palace, Peking, China. The chorus can be any number and two sopranos, one alto, one tenor, three baritones are needed for the solo parts. Orchestral parts may be rented.

NEWMAN ALBUM OF CLASSICAL DANCES
Fourteen Beautiful Dances with Music

An attractive volume of considerable value to those desiring material of this kind for use in playgrounds, schools, festivals, carnivals, fetes, etc. Descriptions are accompanied with all the movements, diagrams of all figures and foot positions. **Price, $2.50**

SPECIAL JUVENILE OPERETTAS

A ROSE DREAM
By Mrs. R. R. Forman Price, 60 cents
A sparkling fairy operetta for little folks, requiring about 30 minutes.

A DAY IN FLOWERDOM
By Geo. L. Spaulding Price, 60 cents
Any number of children may be used in this entertaining offering for 35 minutes.

THE GOLDEN WHISTLE
By Mrs. R. R. Forman Price, 60 cents
A clever juvenile operetta that will please.

RAINBOW'S END
By Cynthia Dodge Price, 60 cents
A three scene operetta for children that is decidedly pleasing.

THEO. PRESSER CO. 1710-1712-1714 CHESTNUT ST. PHILADELPHIA

Etude Cover Design Contest

$250.00 Prize

THE ETUDE Herewith Announces a Prize Contest Open to All for Cover Designs Suitable for Our Publication.

REGULATIONS

1. The designs must have distinct musical significance with an appeal to as large a section of THE ETUDE'S widespread body of readers as possible.

   The design should be attractive from the News Stand (the selling standpoint), but must also make an effective cover for the music lover's home.

   Designs with a historical, educational or humorous trend will be considered with interest. Designs that are merely allegorical, purely idealistic with Grecian, Roman, or essentially antique grounds are not solicited. THE ETUDE is a practical paper for music-lovers, teachers and students of to-day.
2. Designs may be for two- or three-color reproduction.
3. Designs must be drawn in proportion to reduce to the standard size of THE ETUDE, 10½ inches wide by 13½ inches high.
4. The design must not bear wording or lettering.
5. Avoid the introduction of lyres, pan-pipes lutes, antique instruments, banjo, guitar, etc. If an instrument is used employ the piano, organ or the instruments of the symphony orchestra.
6. Any contestant may submit as many designs as desired.
7. The ownership of the copyright of the winning design will rest with THE ETUDE.
8. All designs submitted must bear upon the back the full name and the address of the artist.
9. Postage to insure return must be sent with every design.
10. THE ETUDE assumes no responsibility for loss of or damage to any design, but every possible care will be taken of the designs while in our offices.
11. The contest will close Sept. 1st, 1924

Address all designs to

ETUDE COVER DESIGN CONTEST

1712 Chestnut Street, Philadelphia, Pa.

ETUDE friends everywhere are requested to notify their artist friends of this contest. Big names do not mean anything to us in comparison with effective, attractive, beautiful cover designs. Art Schools and Art Departments of Colleges everywhere are invited to co-operate with us in this contest.

Musical Tempests

By John M. Hargin

It is little short of amazing to note the number of intelligent people who seem to be delighted with the various musical concoctions known as "Storm" written for the organ. Many of these, it is true, are improvised by the performer. We know of one man who made a handsome income for a number of years as a kind of Jupiter Pluvius of music. Every night he drew crowds of people to a huge church to listen to a somewhat ingenious but thoroughly clap-trap performance. Who are we to accuse him of being a musical quack?

The people who heard the "Storm" were delighted by it; some went twice; some went several times. They were of the class of those who "didn't know enough to come in out of the (musical) wet." Why should we make fun of them?

E. M. Bowman, a very fine organist and an able musician, used to play a musical storm at the Baptist Temple in Brooklyn. At the proper moment the electric sign over the organ would flash on and off the words "Glory to God," simulating lightning. I asked him once why the "Storm" was liked so much at the Baptist Temple. He replied with a twinkle, "I guess it's because they are Baptists and believe in water." Bowman used to say that he washed away the wreck of the "Storm" at every performance with the Bach *G Minor Organ Fugue* which he played in really remarkable fashion.

An organist in London has apparently been working the "Storm" game with the customary meteorological musical success. "The Choir" in an editorial says of his performance, "I don't know what Handel would say, I'm sure. I was at the Central Hall, Westminster, one evening when Mr. Meale gave once more his representation of a storm at sea. All the lights in the place were extinguished, and even the player sat in the darkness while the thunder rolled. Somebody on the platform afterwards declared they heard a cry of 'Steward!'

"I should think the popular organist must have given his "Storm" pieces in London a few thousand times. The trouble is that the more ignorant sensation-lover who yells for them seems to have the idea that they are far cleverer than anything else, and I fear he hasn't the foggiest notion as to what constitutes Mr. Meale's best work."

Clothes Bespeak the Wearer

By Judson R. Dowdy

Some time ago the mother of two boys remarked, "You know all children, even boys, admire pretty clothes; and they certainly like to see their teachers look nice. Often my boys will tell me about a new hat, or something that has attracted them about 'teacher's' personal appearance." On another occasion a pupil remarked that a teacher she knew often taught in a dust cap in the mornings because she had not finished her work at teaching time.

Often when we are very busy we do not take quite as much time to attend to our own looks as we should. We think that if we are good teachers small things like the dresses we wear should not matter. They don't most probably—to the parents—but children have to be attracted to the teacher as well as to the music. And we all feel a little pleased if our new dress is commented on by some little pupil.

Another phase worth considering—the well-dressed teacher looks prosperous. People certainly have more confidence in a prosperous-looking person. People certainly have a curious way of wanting their children to study with a prosperous teacher.

We all feel better if we know we are dressed in good taste and look our best. If we feel better we can certainly do much better work. So while a cheerful smile and a pleasant word are a necessary beginning to a good lesson, we owe it to ourselves, our pupils and our pocketbooks to look our best at all times.

Great Masters and Little Actors

By Rena I. Carver

We were sitting in the music room one evening listening to the talking machine. At the end of one of the selections, Cousin Bob asked, "What record was that?"

Before anyone else had time to speak, Betty Ruth, who sat on his knee, gave the correct answer. This so astonished us that we proceeded to investigate. We put on an old record and she shouted the name after hearing but the first phrase. This led to our giving systematic attention to the musical inclinations of our blue-eyed, rosy-cheeked three-year-old.

Living for a time in the same city with a famous prodigy caused us to adopt somewhat the same method in teaching Betty Ruth the biographies of the master musicians. Brother Ben was a genius at building miniature houses and doll furniture, and from pictures and descriptions he evolved a plan and erected a tiny residence for each composer. Then he procured a doll with eyes, hair, figure and features as nearly as possible like each musician and dressed it in the fashion of the period. In some cases it was impossible to obtain the correct facial resemblance and Aunt Lucy, who in girlhood had studied modeling, moulded heads for such, which we tinged. Each day Betty Ruth learned something of the environment and characteristics of a Master, heard some of his music and perhaps hummed a tune from some one of his compositions.

Knowing her delight in dressing up and "pretending," we made a costume and let her play that she was Mozart's sister. One day while she was wearing this costume, she begged to be taught a piece on the piano, so she could play as Nannerl did; and she was given her first piano lesson.

This idea has been expanded into very entertaining and instructive playlets giving the childhood of the great masters. These may be obtained from your publisher. Who ever knew a child that did not like to dress up? We are all actors? And this shows in our childhood more than at any other time.

It Is None Too Early to Begin Making Up Your Music Order, Right Now

SPECIAL NOTICES AND ANNOUNCEMENTS

PERSONAL, FOR SALE or WANTED

Rate 10c per word

WANTED—Young piano student to play duets. German or Spanish speaking preferred. Chicago (Clark-Division). Address C. P., care of Etude.

FOR SALE—Complete course of "Progressive Series of Piano Lessons" reasonable. Mrs. G. F. Wenzel, 807 Grant Blvd., Milwaukee, Wisc.

FOR SALE—Used music any kind at bargain prices. Noel L. Erskine, 320 Clark St., Medford, Oregon.

FOR SALE—Grove's Dictionary of Music and Musicians—elegant condition. Fiebach, Charlotte, Mich.

BARITONE SINGER at liberty, play piano, experienced, conservatory training Soloist, quartette or general work. Best of reference. Wire or write Floyd P. Miller, Huntingdon, Tennessee.

ANNOUNCEMENTS

Rate 20c per word

FOR SALE—Brehmer's Soloist and Professional violin strings are strings of quality and service. Interested violinists drop me a card of inquiry. Bert Brehmer, Rutland, Vt.

FOR SALE—Student Violin Outfit, $25.00. Address Musician, 133 Harrison Ave., Lancaster, Ohio.

KEYBOARD—Piano method for children as young as four years of age. Price 15 cents. Money refunded if you are not satisfied that the idea and method of teaching are worth this amount. M. Royle, 3559 Mission St., San Francisco, Calif.

FREE TO VIOLINISTS—"Singing Melody" violin and piano. Tuttle Music House, 1944 E. Passayunk Ave., Phila., Pa.

MUSIC COMPOSED—Send words. Manuscripts corrected. Harmony, Correspondence lessons. Dr. Wooler, Buffalo, N. Y.

WHY NOT LET US PLAY FOR YOU? Roy Johnson's Colored Orchestra. Phone Spruce 10386 or write 413 S. 19th Street, Phila., Pa.

MUSIC COMPOSED; manuscripts revised. Band and Orchestra arranging. Complete and guaranteed instruction in Harmony by mail. J. Rode Jacobsen, 2638 Milwaukee Ave., Chicago, Ill.

CORRESPONDENCE HARMONY by a sound, practical method. Carl Hoffman (late of Hollins College, Va.), 33 W. Ashmead Place, Philadelphia, Pa.

MUSIC COMPOSED OR ARRANGED—Song or obbligato composed. Original melodies guaranteed to meet your approval. Classical or popular music arranged for Piano, Orchestra or Band. Melodies harmonized for voices. Manuscripts corrected. Music simplified, transposed or copied. Jack Kuh, Suite 712, 1476 Broadway, New York, N. Y.

Violin Offerings

Featured With Great Success By

ARTHUR HARTMANN

On His Recent European Tour

Adagio and Allegro A. Corelli

Arranged and Edited by Arthur Hartmann

A superior arrangement of an excellent program number. One of the splendid series of master pieces Mr. Hartmann has arranged for violin solo with piano accompaniment.

Catalog No. 13025 Price, 60 cents

Variations for G String Solo (Prayer from Moses in Egypt—Rossini) N. Paganini

Arranged and Edited by Arthur Hartmann

A novelty, yet one of the most beautiful offerings for the violin. Mr Hartmann's arrangement takes care of all the finer artistic points.

Catalog No. 13027 Price, 75 cents

Send for folder listing transcriptions and arrangements for violin and piano by Arthur Hartmann, containing excellent suggestions of interest to Artist Violinists and Violin Teachers.

THEODORE PRESSER CO.

YOU MAY PROVE THE MERIT OF ANY OF THE NEW WORKS ON THIS PAGE BY SECURING A COPY FOR EXAMINATION.

NEW PIANO TEACHING WORKS

Album of Trills

STUDY PIECES FOR SPECIAL PURPOSES No. 1

Price, 75 cents

The trill is an interesting and effective technical accomplishment that is often required in piano playing. No little attention is required to develop properly ability to handle all the various forms of the trill in piano playing, and trill study through the use of interesting trill pieces will gain the pupil's interest far better than coldly presented trill exercises. This album contains eighteen pieces, each employing some form of the trill—about six different forms of the trill appearing throughout the book. Teachers will find this an exceptional help and pupils in the medium grade can be induced to accomplish much in trill playing with the pieces in this album.

25 Melodies for Juveniles

By Mana-Zucca Price, 75 cents

Here one of the foremost women composers of the day has written delightful little melodies for delighting young pianists. Starting with the most easy type of a piano piece the numbers progress in a nice, gradual manner. Clever texts that aid in holding the pupil's interest accompany many of these pieces.

From My Youth

By R. Krentzlin Price, 75 cents

Special attention is given in these pieces to the development of style, rhythm and technic. Each piece is interesting from a musical standpoint and of such character as to make it attractive for the piano student's practice. The first of these dozen pieces start in grade two with gradual progress in later numbers to grade three. One number brings out *Clinging Legato*, others *Light Velocity, Rhythm Groups, Rhythmic Accuracy, Staccato, Triplets, The Trill*, etc.

Stories Notes Can Tell

By Frances Terry Price, 75 cents

These are charming early second grade piano pieces. They are characteristic numbers that delight young players. The key variety will interest many teachers since these six short easy pieces use the keys *C, G, F* and *A minor*.

INTERESTING NEW PIANO ALBUMS

Young Folks' Opera Gems

Price, 75 cents

This is a comprehensive collection of fairly easy arrangements of the favorite opera selections from the great composers from Gluck to Mascagni. The aim in each of these numbers has been to present a playable piano solo of an opera air, frills and variations having been avoided. There are seventeen composers and twenty-three operas represented in the twenty-seven selections in this album. Most of the numbers are in grades two and three.

Contemporary March Album

Price, $1.00

A collection that is useful to many. It answers many demands upon the school, lodge and church pianist. Schools will find excellent material presented for the accompaniment of drills, marches, calisthenics and other gymnastic work. There are dignified march numbers covering other needs also included in the thirty numbers making up this album. All are effective march numbers of their individual types, yet all are within the ability of the average pianist.

Favorite Musical Readings and Pianologues of Coyla May Spring

Written and Compiled by Clay Smith

Price, $1.00

Clever entertainment material is presented in the numbers making up this album. Coyla May Spring is one of the foremost artists in the Lyceum and Chautauqua field and these numbers are picked from a most successful repertoire of musical readings and pianologues. There is humor and philosophy in these numbers and the piano accompaniment lays just right for playing one's own accompaniments.

A NEW PIPE ORGAN ALBUM

Lemare Organ Album

TRANSCRIPTIONS AND ORIGINAL COMPOSITIONS

By Edwin H. Lemare Price, $1.50

Mr. Lemare displays master musicianship at the instrument, and the same master ability is displayed in his compositions and transcriptions. In addition to several fine original compositions there is in this album a generous lot of folk song, hymn, operatic and other favorite melodies that have been transformed into effective solo numbers for the pipe organ. An excellent album for theater and concert organists.

The Three Players

A COLLECTION OF SIX-HAND PIECES FOR THE PIANOFORTE

Composed, Arranged and Edited by A. Sartorio Price, $1.00

There has been a long-felt need for an album of this character, but publication of such an album was not to be undertaken hurriedly, as it was desired to make it something more than a compilation of six-hand piano pieces. The variety of material and the well-balanced parts throughout this collection show the care with which the album was assembled. There are several original compositions by Sartorio, around a half dozen arrangements of melodies by the old masters and the balance of the eighteen numbers are arrangements of excellent numbers by favorite contemporary composers. The numbers are about grades two and three in degrees of difficulty.

A VIOLIN WORK RECENTLY ISSUED

25 Selected Studies from H. E. Kayser, Op. 20

WITH SECOND VIOLIN ACC. IN SCORE

Selected and Edited by Chas. Levenson

Price, $1.00

Everyone knowing anything about study material for the violin is familiar with the position held by Kayser, Op. 20 studies. These studies are valuable aids in violin instruction, but despite their years of use it has remained for Chas. Levenson to conceive the perfect form in which to use them. This work utilizes the best of the Kayser, Op. 20 studies and supplies a second violin part for the teacher to play as an accompaniment to the pupil's rendition of the studies. The helpful value of this can not be overestimated, as it perfects the pupil in time, rhythm and ensemble playing in general while developing technical ability in fingering and bowing.

NEW CHORAL PUBLICATIONS

Four Seasons

FOR THREE-PART CHORUS OF TREBLE VOICES

By Richard Kieserling Price, 60 cents

About twenty-five minutes is required to present this work, which is really a cycle of four exceptionally attractive choruses for treble voices, the writing being in three parts. The work is effective, yet can be presented with few rehearsals. Women's Clubs, High School Choruses and other groups requiring choral material of this kind will find *Four Seasons* enjoyable to sing and enjoyable for audiences to hear.

Hymn of Praise

CANTATA FOR THANKSGIVING, FESTIVAL OR GENERAL USE

By Frederick Wick Price, 60 cents

This is a very satisfactory offering for musical praise, the text being selected from the Holy Scriptures and the time required for rendition being but from 30 to 40 minutes. There is grateful solo work for Soprano, Tenor and Baritone and the Choruses for mixed voices are not difficult, yet they are effective and pleasing.

In Foreign Lands

CANTATA FOR TWO-PART TREBLE VOICES

Words and Music by Richard Kieserling

Price, 40 cents

This is virtually a cycle of four delightful two-part choruses. These choruses are entitled *On to Spain, Egyptian Moonlight, A Japanese Tea-Party* and *Romany Life*. Directors of music in college seminaries and schools for girls will find this an attractive work. This work also would make a fine feature number on the program of a women's club.

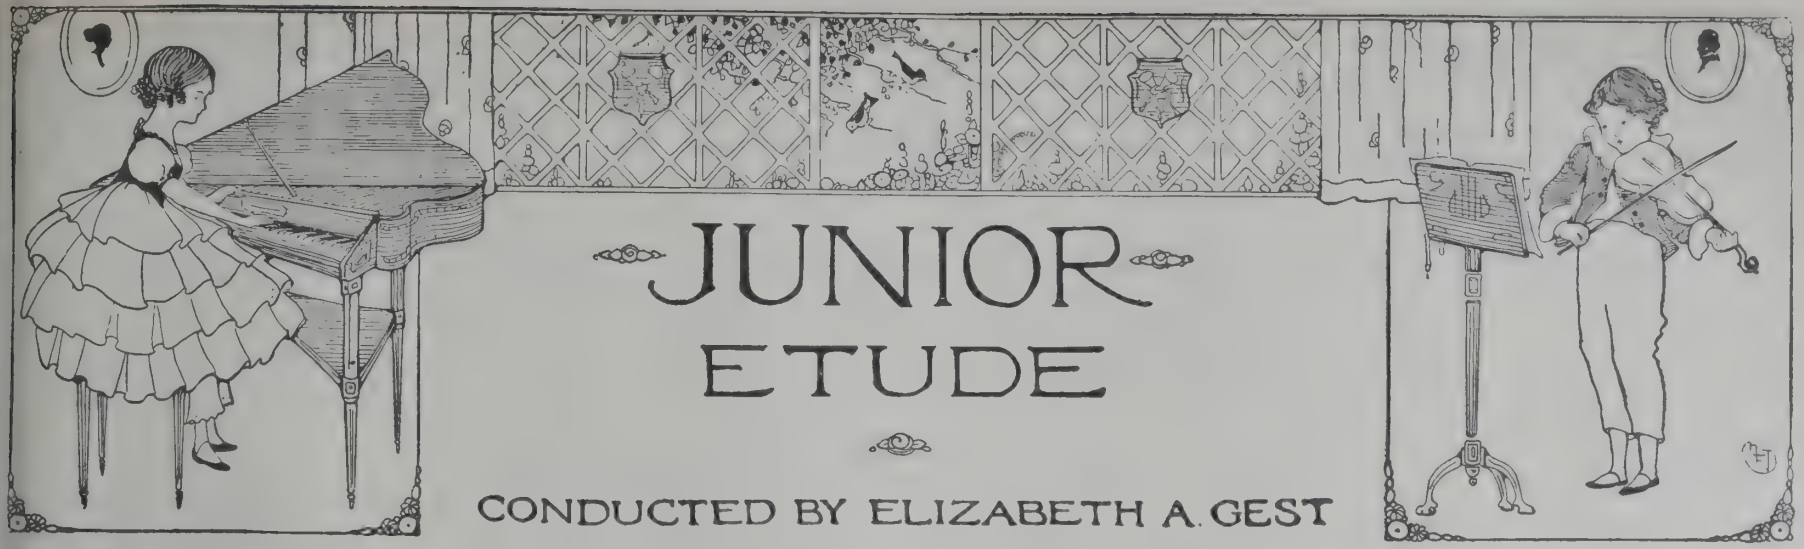
A CLEVER MUSICAL COMEDY

Knight of Dreams

or

A MODERN PYGMALION AND GALATEA
A MUSICAL COMEDY IN THREE ACTS
Books, Lyrics and Music By
May Hewes Dodge and John Wilson Dodge
Vocal Score, with full dialogue, Price, $1.00
Stage Manager's Guide, Price, $1.00
Orchestral parts may be rented

This is quite a worth while musical comedy that will more than satisfactorily cover an evening's entertainment. The solo parts are for two sopranos, one tenor, one tenor or high baritone, one baritone, one baritone or bass and two contraltos. The choruses are made up of art students of both sexes. The music is "catchy" and the action is lively. It is easily staged, scenery and costuming being easy to arrange.



JUNIOR ETUDE

CONDUCTED BY ELIZABETH A. GEST

List of Musical Terms (No. 7)

THIS list was begun in the January issue.

Largo—a very slow movement.
Leggiero—lightly and delicately.
Lento—a slow movement, but not quite so slow as largo.
L'istesso—same as istesso, see last list.
Leger Lines—short lines placed above and below the staff for the tones that extend beyond the staff.
Legato—in a smooth and connected manner.
Lyric—Melodious music, or poetry, suitable for song.
Ma—but.
Maestoso—in a majestic and dignified manner.
Marcato—well marked or emphasized.
Marcia—as a march.
Madrigal—a secular composition for three or more voices without accompaniment.

??? Which ???

"I think," said a scholar, "that music has come
To be a most queer sort of thing;
Because it's so weird and the chords are so harsh,
It seems that it don't really sing."

"But I don't agree," said a man standing near;
"I think, sir, that you are quite wrong;
The music to-day is more modern, of course,
But it sings a most wonderful song."

"But look at the chords," said man Number One;
"They sound so exceedingly queer;
They seem to be made of all keys played at once.
Just think of the discords we hear!"

"But discords are splendid," said man Number Two;
"Especially when handled with care;
In fact, I prefer that the music should have
Some discords put in here and there."

"I cannot agree, though," said man Number One;
"Your taste is quite different from mine;
I'll listen with you to this weird sounding stuff,
But for the old masters I pine."

Wolfgang Amadeus Mozart

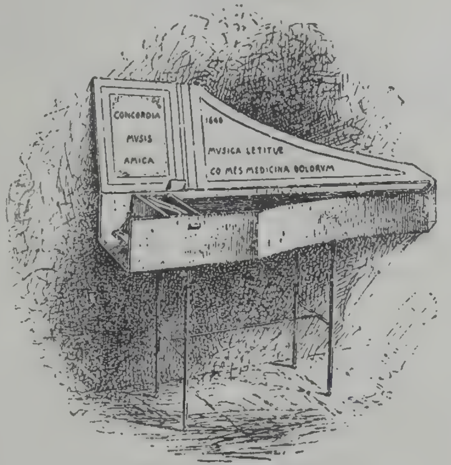
M—ANY a young student has taken Mozart as a model, for when
O—nly three years old he played in public.
Z—ealous was he for success, and worked very hard.
A—t the age of seven he was a composer,
R—anking high in the estimation of his hearers.
T—hus he began at a very early age his brilliant musical career.

That Queer Piano

By Rena Idella Carver

DONALD had been trying his best to practice his next music lesson while shouts of his playmates came clearly through the open window. Finally he grew impatient and exclaimed, "Oh, shoot! I believe pianos are old-fashioned, anyhow. I guess they are awfully old. Even Grandmother Wilson had a piano. It was not like this one, though. It was an old square. So I guess pianos will soon be clear out of date."

He had no more than finished speaking when he felt himself being whirled around and around so fast that he closed his eyes to keep from getting dizzy. At last something seemed to let go and he dropped with a thump upon a chair. When he could get his breath, he opened his eyes and beheld a tiny, triangular-shaped instrument.



HANDEL'S HARPSICHORD

"Why, what a funny old thing! Just look at those keys—only three octaves," he burst out.

Donald heard a great, hearty laugh behind him; and there stood a huge, bulky man, whose long, curly white wig encompassed his fat, red face.

"So you thought a concert grand piano old-fashioned, did you? Now here is a musical instrument that really is old-fashioned. It is a Spinet. Let me show how the string is set in vibration. This is done by *plucking* the string with a quill set in a jack at the end of the key," said he.

"Oh, those little things standing up at the ends of the keys are called quills! Aren't they cute? Just like soldiers standing at attention!" exclaimed the boy, much interested.

The big man smiled and went on explaining. "You see, the action is so arranged that, after the key is released, the jack falls back to its place, while a damper comes against the string, preventing its further vibration."

"And just look! There is only one string to a key. Each key has a separate string. In pianos each key has three strings," Donald declared.

"The Spinet had but one string to each key. A later instrument, however, had three or four strings to a note," commented the man with the wig.

"Please tell me about it," pleaded the boy.

"Yes, that is the way with these youngsters. They are never satisfied with what they have," the man broke out crossly.

Before Donald could realize it, he was whisked away at a terrific pace. Suddenly he was set down.

"Now what do you think of this instrument?" queried his companion.

Donald opened his eyes and gazed at a beautifully carved, elaborately decorated, small grand piano. "Why, it has two keyboards or manuals like an organ," he shouted. "It's very pretty, though."

The boy began to play one of his favorite pieces, but soon stopped with a big frown on his face.

"The tones are all alike. I can't make them loud or soft. Teacher says never to play like that," he complained.

"Well, you will not be able to play in any other manner on this Harpsichord," was the amazing information. "The chief defect, and one which the makers tried in vain to remedy, lay in the fact that the *plucking* of the strings, while producing greater brilliancy, *admitted* of *no variations* in the degrees of *loudness* or *softness*. They experimented a great deal, even inventing various kinds of quills," the immense man answered.

Donald tried the Harpischord again. "Oh, such a crazy old thing as this. No wonder they invented the piano. Gee, I wish I was playing mine right now. I guess it must be quite up-to-date after all," he concluded.

He felt himself being whirled rapidly through the air for what seemed like a long, long time. Then he was dropped with a gentle thud. When he was able to open his eyes, he was seated before his own big piano in the music-room.

Ambition

I sometimes think I'd like to be
A very famous man;
And, if I do my practicing,
Why then perhaps I can.

I'll practice just as teacher says,
And learn my lessons well;
And then some day you'll come to hear
My concerts. Who can tell?

Summer Time

How are you planning to spend your summer? So many have the feeling that summer is a time of utter do-nothingness. They seem to think that they are being imposed upon if they are expected to do anything at all during the summer months. But surely no JUNIOR ETUDE readers feel this way about summer time; because the junior readers are all earnest music students, and they all realize that if music lessons stop it is only to give their poor teachers a vacation; and the time must not be wasted by never going near the piano. Much practice can be done during vacation and many old pieces reviewed, so that when the lessons begin again your teacher will not be discouraged at your lack of accomplishments!

Give yourselves a certain amount of work to do during vacation. Take a pencil and piece of paper and write out the list now. At the top of the page put the date and your name to show that you are really in earnest. Then put the length of time you will practice each day. For some it may not be as much as regular winter practice, and for others it may be a good deal more, as there will be no school work or other things to interfere.

Then make a little schedule, dividing the time between exercises, studies, scales, and pieces, new ones, old ones, memorizing, and so on.

Give particular attention to old pieces. Try to review, or rather, "renew" all the pieces you had last year and even the year before, and have them all perfectly memorized.

During the regular season there is not always time to go back over some of the old pieces, as there are so many new ones to learn; but in the summer time they should all be put carefully on the little shelves of your memory, and labeled, so that at any moment you can bring them out through your fingers and play them for your own pleasure and for your friends. DO IT NOW.

??? Question Box ???

DEAR JUNIOR ETUDE:

I have often been puzzled by some of the terms in music. For instance, why do diminished chords and this mark > have the same name?—M. F. (Age 15), Ohio.

Answer.—The term "diminish" means, when applied to music, just what it means when applied to anything else, and that is "to make less." Therefore the sign > means to make less tone, or, to get softer, as it is often expressed. A diminished chord or diminished interval is one which has been made less, or smaller. For instance, C-G is a perfect fifth; but if you diminish that interval by a half step (subtract a half-step from it) the interval becomes C-G flat, and is spoken of as a diminished interval. A diminished chord is a chord which contains this kind of an interval.

SUMMER PLAY THAT DEVELOPS THE MUSICAL KNOWLEDGE of CHILDREN
Give Them Scissors, a Little Paste and one of the
Child's Own Book of Great Musicians

A little booklet with cut-out pictures, cover, needle and silk cord for binding may be had of each of the following composers:

BACH HAYDN SCHUBERT
BEETHOVEN LISZT SCHUMANN
CHOPIN MENDELSSOHN VERDI
GRIEG MOZART WAGNER
HANDEL *Price, each 20 cents.*

Many teachers utilize these booklets with great success throughout the regular teaching season. Those who do not include such work in their regular course of instruction should see that the child has something of this character to keep up interest in music during the summer.

1710-1712-1714 Chestnut Street

Junior Etude—Continued

Star Light, Star Bright

By Edna M. Schroeer

"Star Light, Star Bright, First star I've seen tonight, I wish...."

"What do you wish, my little sister?" asked the beautiful star.

"I wish," said the little girl, thoughtlessly, "that I did not have to practice any more and would never hear music again."

The beautiful star sighed, for it knew that that was a terrible wish but it granted the wish, nevertheless.

The little girl ran into the house. She thought she was singing for joy but she soon discovered that she was not making a sound. She laughed, thinking it was a joke, but there was no mirth-music in her laughter. Her mother was singing baby to sleep, but it sounded monotonous and made her cross. Then before going to bed, the family gathered around the piano and she tried to play, but there was no music in her heart, and she had to give it up.

"Why what is the matter, Doris dear, you played so well last night?"

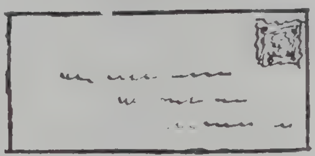
"Oh it is dreadful, Mother. I really do love music. Realy I do. Oh why did I ever make such a horrible wish. Do you think that Star Bright will ever take back my wish?"

So Doris went to bed, but as soon as her mother thought she was asleep she tiptoed to the window and looked up in the sky.

"Star Light, Star Bright, First Star I've seen tonight. I wish....Oh please take back my horrible wish. Please!"

So Star Bright took back the horrible wish and Doris practiced every day and soon grew to be a very good musician.

Letter Box



Dear Junior Etude:

My older brother has taken The Etude for some time and I find it very interesting. I have been reading it and saw the letters in the Junior Etude, and thought I would write one, too.

I am ten years old and we have no music teacher in our village, but my brother teaches me a little, and we practice duets together. I certainly would like to take music lessons, but The Etude helps me a good deal. A few of my friends and I gather at each others' houses and play our pieces that we have learned.

I have never tried the Junior contests, but intend to try them every month.

From your friend,
Isabel Oberle (Age 10),
Fermosa, Ontario, Canada

N. B.—How would some of the Junior Etude readers like to change places with Isabel and live where there is no music teacher?

The next time you go to your lessons, say to yourself, "Well, I certainly am glad that I have a music teacher, and intend to do very good work, too, while I have the opportunity."

Dear Junior Etude:

I do not take you myself, but I read my cousin's Etudes. I live in Honolulu in the Hawaiian Islands and go to a fine big school like the children on the mainland.

From your friend,
Jean Little (Age 14),
1731 Keenamokeu Street,
Honolulu, Hawaii.

Dear Junior Etude:

I am only seven years old and have just started taking piano lessons. We have a music club and we meet every Saturday and each answers to the roll with the name of a musician. Last week my mother took me to a concert. Our teacher has a lovely studio, and when it was all fixed up and ready to use my teacher invited every one to come to see it, and some of the older girls played. Some of the girls made candy and sold it, and we are going to buy a music stand for the studio with the money.

From your friend,
Alice West Pierce (Age 7),
Indiana.

Dear Junior Etude:

Our music class has a club which we have named the Crescendo Music Club. We have thirty-six members and meet monthly with our teacher. At these meetings we answer the roll call with musical items and have musical programs. We receive musical "Prize cards" for highest averages. We are graded on our lessons; and when we have especially good points gold stars are placed on our books.

From your friend,
Kathleen Ellis (Age 12),
North Carolina.

Letter Box List

Letters have been received from the following Junior Etude readers: Jean Bingham, Dorothy Query, Margaret Lindsay, Blanche Gregory, Frances Stokosa, Mildred Long, Angela Zeckerle, Margaret Brainerd, Viola Hughes, Mary Moffer, Dorothy W. Newell, Lucile Hill, Barbara Chase, Maria Felton, Leora Hurlbutt, Catherine Taylor, Stefia Stokosa, Elinor Grinnen, Melvin W. Pipkorn, Florence M. Fox, Barbara Wise, Hermoine Hupp, Margaret Wait, Luther Stone, Jr., Dorothy Jennings, Phyllis Gordon, Ruth Wade, Florence D. Jenner, Mabel Root, Gertrude Hayes, Mary Decker York, Elizabeth McPheeters, Joyce Ellsworth, Barbara Bostwick, Bernice McCain, Eleanor Harper, Ina L. Nelson, Helen Statler, Ruth Longfellow, Herbert Schueller, Vera Pearl Zscheile.

Anton Rubinstein

Born, Vichvatinets, 1829, Died, Peterhof, 1894

A pianist second only to Liszt, his playing being noted for fire and impetuosity. Founder of the Imperial Conservatory of Music at Petrograd. The *Ocean Symphony* and *Piano Concertos in D-Minor* and in G are his best known compositions in large form.

ETUDE MUSIC MAGAZINE 1710-12-14 Chestnut Street, Philadelphia, Pa.

"A Skin You Love to Touch"
by Guy Hoff

You too, can have "A skin you love to touch"

Are you dissatisfied—

with your complexion? Do you long for a skin so fresh and radiant that no one can see it and not admire it?

Then begin now to make your skin what you want it to be. There is nothing fixed about your complexion; your skin is a living thing that constantly changes. Each day old skin dies and new takes its place.

By giving this *new skin* the care it needs, you can actually make it over. You can free your complexion from faults that have troubled you for months, and even for years.

You will find the right treatment—

for your special type of skin in the booklet of famous skin treatments, *"A Skin You Love to Touch,"* which is wrapped around every cake of Woodbury's Facial Soap.

If your skin is too oily—if it is pale and sallow—if you are troubled with blackheads—with blemishes—with conspicuous nose pores—begin at once to use the special treatment that will overcome this trouble.

Thousands of girls and women—

by following these famous skin treatments, have built up a fresh, clear, beautiful complexion. You, too, can have the flawless skin you have always longed for, by giving it this special care.

Get a cake of Woodbury's today, at any drug store or toilet goods counter—see what an improvement even a week or ten days of the right treatment will make in your complexion.

The same qualities that give Woodbury's its beneficial effect in overcoming common skin troubles make it ideal for regular toilet use. A 25 cent cake lasts a month or six weeks. Woodbury's also comes in convenient 3-cake boxes. The Andrew Jergens Co.

Three Woodbury skin preparations—guest size—for 10 cents

THE ANDREW JERGENS CO.,
5605 Spring Grove Avenue, Cincinnati, Ohio.

For the enclosed 10 cents—Please send me a miniature set of the Woodbury skin preparations, containing

A trial size cake of Woodbury's Facial Soap
A sample tube of Woodbury's Facial Cream
A sample box of Woodbury's Facial Powder
Together with the treatment booklet, "A Skin You Love to Touch."

If you live in Canada, address The Andrew Jergens Co., Limited, 5605 Sherbrooke St., Perth, Ont. *English agents:* H. C. Quelch & Co., 4 Ludgate Square, London, E. C. 4.

The World of Music

A Tribute to American Music and American Musicians is contemplated by the American Society of Composers, Authors and Publishers. At present the plans call for a four-million-dollar building in the heart of New York's theatrical district, dedicated to American music and other arts.

Roberto Moranzoni, formerly with the Boston Opera Company, and later with the Metropolitan Opera Company of New York, is reported to have been engaged to fill the place on the conductor's staff of the Chicago Civic Opera Company left vacant by Ettore Panizza, who has returned to the La Scala of Milan.

Theodore Dubois, the eminent French organist and composer, died in Paris on June 11, in his eighty-eighth year. In 1861 he won the *Prix de Rome* with his cantata "Atala." He became professor of harmony at the Conservatoire in 1871; and in 1877 succeeded Saint-Saëns as organist of the Madeleine. At Gounod's death in 1894, Dubois was elected to his chair in the Académie. At the death of Ambroise Thomas in 1896, Dubois became head of the Conservatoire, which position he resigned in 1905. His published works include operas, ballets, oratorios, symphonic poems, many songs and chamber compositions and numerous organ works.

The Lydian Singers of America is the name of a fraternal association of musical artists, a brotherhood of songsters intended to be national in its scope, which has had its inception among the music lovers of Jacksonville, Florida.

An American Opera Each Year, with an American cast and American director—a truly American production—is the new enterprise launched by the National Federation of Music Clubs. "Castle Agrazant," by Ralph Lyford, of Cincinnati, is to have the honor of inaugurating the movement this coming fall.

European Music Festivals are gradually being resuscitated. The "Smetana Festival" at Prague is in progress as we go to press; July 22 will witness the revival of the "Bayreuth Festival," after a lapse of ten years; a "Mozard Festival" is being held at Baden-Baden throughout June, July and August; and in August the usual "Mozart Festival" will be conducted at Salzburg.

The Du Brouq Stradivarius, pronounced by experts to be one of the finest specimens of that master, and used for the last eighteen years by Efrem Zimbalist, has lately been sold by a Boston dealer to D. H. Walton, of Brookline, Massachusetts, at a price reported to be near twenty thousand dollars.

A "Boy Scout Band" of two hundred and seventy-five pieces, the largest Boy Scout band in the world, is the pride of Springfield, Missouri. They have toured successfully in concerts as far as the Pacific coast.

Charles Martin Loeffler's orchestral work, "Memories of Childhood—Life in a Russian Village," was awarded the $1,000 prize by the Chicago North Shore Festival Association and received its first performance there on May 29. In the same contest Edward Collins won honorable mention with his "Tragic Overture," which award carries with it the privilege of performance by the Chicago Symphony Orchestra at a regular pair of concerts during the 1924-1925 season.

The "La Scala" Season at Milan closed on May 21. One hundred and thirty-five performances, of thirty-five different operas, were given. "La Traviata" led in popularity with fourteen hearings to its credit; "Nerone," Boito's spectacular opera, which had its world premiere there this year, had nine performances, and has been chosen to open the new season on November 15.

"The Star-Spangled Banner" will become the authorized national anthem of the United States, if a bill now before Congress becomes a law. This bill also provides for punishment for disrespect towards the song.

Marcel Dupre has resigned his position as organist of Notre Dame Cathedral, Paris, to devote his entire time to concert work.

A $1200 Fellowship and free transportation to and from Italy are offered by the Caruso American Memorial Foundation. Candidates for this year are limited to sopranos and tenors, must be American citizens between twenty and twenty-seven years of age, and should be able to sing entire rôles of three or more standard operas. Particulars may be had from the Caruso American Memorial Foundation, Room 216, Produce Exchange Building, New York.

Mme. Rosa Sucher, in her prime internationally famous as a Wagnerian singer, and especially in the rôles of *Isolde* and *Brunnhilde*, is reported to be lying crippled and bedridden, without the ordinary comforts (because of the fall of the mark) at a small inn near Aix-la-Chapelle.

Members of College Musical Clubs do not have a conspicuously lower standing than their fellow students, according to a statement of President Hibben, of Princeton University, in *Musical America*.

The Caruso Bust, by Cifariello, orginally intended for the lobby of the Metropolitan Opera House of New York, has been sold to the Luxembourg Museum of Paris, according to a report from Venice.

Walter Damrosch, eminent American conductor, has been elected by the French Government to the "Legion of Honor" in recognition of his great services to music.

Edward Baxter Perry, widely known pianist and composer, passed away at his home, in Camden, Maine, on June 13. He was born at Haverhill, Massachusetts, February 14, 1855; was educated in Boston and in Europe where he studied with Kullak, Pruckner, Clara Schumann and Liszt. His famous lecture-recitals, of which he had given more than three thousand, took him into every State of the Union. Many compositions for piano and for string quartet, articles for leading magazines, and several valuable volumes of analyses of piano compositions, came from his pen. The news of Mr. Perry's death coming just as we are going to press prevents our giving the more extended notice we would wish.

The Danish Harmonien Singing Society, of Chicago, consisting of one hundred and ten Danish-Americans, has gone for a tour of Denmark, where the itinerary includes fourteen charity concerts before they return to America in September.

The New "Art Center" of New York, which will cost $15,000,000 or more, is to be located facing Central Park. Its space will be somewhat equally divided between Music and Industrial Art; and it will contain four auditoriums, one each for Opera, Chamber Music, Drama, and Intimate Theatrical Productions. Practice Rooms and Studios for Musicians and Exhibition Rooms for Art Students, will be provided.

Purcell's "Dido and Aeneas" had open-air performances in Hyde Park (London) on July 5, 12 and 19, under the auspices of The League of Arts. About five hundred singers and instrumentalists took part in the event, recruited largely from the amateur ranks.

The late Sir Frederick Bridge, so long organist of Westminster Abbey, left a small fortune of £10,545, with a considerable collection of silver which had been presented at various important periods of his career.

A One-Thousand-Dollar Prize is again offered by the North Shore Festival, of Evanston, Illinois, for the best orchestral composition submitted before January 1, 1925. Contestants must be American by birth or naturalization.

The First and Only Colored Band in the United States Navy, according to a report, is that stationed in the Virgin Islands, the latest possession of the United States. From bandmaster to bass-drummer the personnel is native to the Islands.

The Hartford (Connecticut) Philharmonic Society, after a quarter of a century of useful service in the development of the musical tastes of that city, has been disbanded for want of patronage. Mrs. Charles Dudley Warner, wife of the famous author and editor, was its founder.

The Worcester Musical Festival, under the management of the Worcester County Musical Association, the oldest musical organization of its nature in America, will have its annual program in October, with Henry Hadley as conductor. Mr. Hadley has been elected to take the place left vacant by the late Nelson P. Coffin.

A Monster Military Band of one thousand members, selected from every regiment of the British Army, was a feature of "Empire Day" festivities at the Wembley (England) stadium early in May.

Mirza Hussein Kahn Alai, Persian Minister to the United States, is not only a talented and highly trained musician, but also is one of the greatest authorities on the music of his native country.

"La Perle de Chicago" (The Pearl of Chicago), an operetta by M. Maurice Dekorba, with music by M. Sylabell-Demars, is a late success in Paris.

A Bruckner Symphony, till now unknown, has been discovered and will be performed at Vienna in the coming September, on the occasion of the centenary of the master.

The Estey Organ Company Scholarship to the Fontainebleau School of Music (France) has been awarded to Miss Leah Mynderse, a native of Albany, New York, who has for six years been organist of the Morningside Presbyterian Church of New York City. Her education has heretofore been received entirely in America.

President Coolidge addressed the National Music Industries Convention. which met in New York early in June. Again the Tonal Art is fortunate in having in the White House friends of its muse.

Theodore Morse, one of the most popular song writers of America, whose "Blue Bell" was the super-hit of the Spanish War times, passed away in New York, on May 25.

Verdi's "Manzoni Requiem" was presented at the Crystal Palace (London) on June 21 by the Handel Festival Choir and Orchestra of twenty-five hundred members, with noted soloists. Ill-health detaining Sir Frederick Cowen, the regular conductor of these events, his place was filled by Sir Henry Wood. The performance was in the nature of a semi-centennial celebration of the first production of the work at St. Mark's Church, Milan, on May 22, 1874.

The State Concerts at Buckingham Palace, which lapsed with the passing of the good Queen Victoria, are to be revived in cognizance of the appointment of Sir Edward Elgar to the Mastership of the King's Music. In "the good old days" appearance at these concerts was a plume in the bonnet of the musical artist courting public favor.

The Fostoria (Ohio) High School Band, which last year won the national championship in the contest held at Chicago, won the state championship of Ohio at a contest which closed at Fostoria on June 7. J. W. Wainwright is the director of the winning band. Taylor Branson, Second Director of the United States Marine Band, of Washington, D. C.; H. S. Warren, Director of Instrumental Music at Gary, Indiana; J. W. Fay, Director of Instrumental Music at Rochester, New York, and chairman of the National Band Contest, were the judges of the musical tournament.

A Mozart Symphony in C Major, till now unknown, has been found by research students from the Musical Historical Institute of the University of Vienna, in the Benedictine Convent of Lamback, Austria. Experts place it among the Vienna symphonies of 1767-1768. Among other manuscripts of the archives which the students are classifying are fifteen symphonies by Mozart's father.

A Musical Typewriter is reported to have been invented by Fortoni, a musical director. At a demonstration a portion of a Tschaikowsky work was transcribed in a few minutes and then transposed into another key with equal rapidity. The machine has forty keys, each with six symbols.

The "Birthplace of Yankee Doodle," old Fort Cralo, Riverside Avenue, Renssalaer, New York, has been given as an historical museum to the State by Mrs. Susan Delancey Van Renssalaer Strong, of Philadelphia, who was born there. It was in this fort that some British genius wrote the poem, "Yankee Doodle," in 1758, in derision of the American soldiers.

ELENA DE MARCO

All Orchestral Instruments Taught

FREE SCHOLARSHIPS AND PRIZES OF THE TOTAL VALUE OF $20,000

75 Free and 140 Partial Scholarships awarded each year. Free and Partial application blanks on request. Mason & Hamlin Grand Piano, presented for competition in the Post Graduation Class by the Mason & Hamlin Co. Conover Grand Piano presented for competition in the Graduation and Senior Diploma Classes by the Cable Piano Company. Valuable Violin presented for competition in the Violin Department by Lyon and Healy. Grand Piano for competition in the Vocal Department. These prizes will be competed for in Orchestra Hall, Chicago, before world-renowned musicians as judges and with Chicago Symphony Orchestra, Frederick Stock, Conductor. Opera Scholarships. 15 prizes of $300 each; 15 of $100; 15 of $50 in the classes: also Diamond, Gold and Silver Medals. Dormitory Accommodations.

59th YEAR

TEACHING, CHAUTAUQUA, LYCEUM, CONCERT
AND ORGAN POSITIONS GUARANTEED

60 EAST VAN BUREN STREET
CHICAGO, ILL.

The COLLEGE OF MUSIC OF CINCINNATI

Because of its liberal endowment you can secure instruction at the College of Music under noted artist teachers at reasonable cost.
You will find inspiration in a city noted for its musical and artistic achievements.
The college and dormitory adjoin the great Music Hall where Cincinnati's famous May Music Festivals and Symphony Orchestra Popular Concerts are held.
Collegiate, General, Preparatory and Public School Courses in Music; Opera, Theory, Composition, Modern Languages, Dramatic Art and Public Reading. All courses lead to degrees.

ADOLF HAHN, Director ALBINO GORNO, Dean.

Write for catalog, terms, etc.

COLLEGE OF MUSIC OF CINCINNATI
1231 Elm St., Cincinnati, Ohio.

DANA'S MUSICAL INSTITUTE

WARREN, OHIO

A University of Music with Daily Instruction in All Branches of Musical Education

SUMMER SESSION OPENS JUNE 16th

Address Lynn B. Dana, Pres. Desk E, Warren, Ohio

Advanced study of music in all branches. Faculty of 35 specialists. High school course or equivalent required. Courses lead to degree of Mus B. Fall semester opens Sept. 16th. Catalog and year book.
Oberlin Conservatory of Music, Oberlin, Ohio

WHAT THE VOCAL STUDENT SHOULD KNOW

By Nicholas Douty Price, $1.00

An introduction to the art of singing, with daily exercises for all voices selected from the works of the great masters of singing. This book tells in an interesting manner the important principles that will guide the vocal student aright.

THEO. PRESSER CO., 1712 Chestnut St.
Philadelphia, Pa.

DETROIT CONSERVATORY of MUSIC

51st Year

Francis L. York, M.A., President
Elizabeth Johnson, Vice-President
Finest Conservatory in the West

Offers to earnest students courses of study based upon the best modern educational principles. Renowned faculty of 80. Students' orchestra, concerts and recitals. Diplomas and Degrees conferred.
Teachers' certificates. Desirable boarding accommodations.

Fall Term Opens Sept. 8, 1924

UNRIVALED FREE ADVANTAGES

Piano—Francis L. York, M.A.; Elizabeth Johnson, Louise Unsworth Cragg, Georgia Richardson Baskerville, Helen Andrus Merrill, Minor E. White, Oleane Doty, Alle D. Zuidema, Mus. Doc.; Wilhelmina Sutz, Laverne Brown, Mus.Bac.; Ethel Littell, Alma Glock and 40 additional instructors.

Organ—Francis L. York, M.A.; Alle D. Zuidema, Mus.Doc., Francis A. Mackay, Beecher Aldrich.

Singing—Archibald C. Jackson, Mrs. Chas. H. Clements, Miss Elizabeth H. Bennett, Fred H. Protheroe, Carl Mann, Mrs. A. W. Davis, Jessie Morehouse, Hermine Lorch.

Violin—Earl W. Morse, Walter Braun, E. N. Bilbie, Mrs. Raymond Brown, Raymond Dulitz, Wm. H. Engel.

Cello—Jules L. Klein.

Harp—Ruth Clynick-Buysee.

Theory, Harmony, Composition—Alle D. Zuidema, —Post Graduate work in this department. Francis L. York, M.A.

Normal Training for Piano Teachers—Francis L. York.

Public School Music and Drawing—Miss Hermine Lorch, Bertha Schaffer.

School of Expression—Miss Lilly Adela Darling, Mrs. Ethlyn Briggs Mann.

Dancing—Mrs. Ethlyn Briggs Mann.

THE ETUDE

AUGUST, 1924 Single Copies 25 Cents VOL. XLII, No. 8

Where the Etude Stands on Jazz

The Etude has no illusions on Jazz. We hold a very definite and distinct opinion of the origin, the position and the future of Jazz.

The Etude reflects action in the music world. It is a mirror of contemporary musical educational effort. We, therefore, do most emphatically *not endorse* Jazz, merely by *discussing* it.

Jazz, like much of the thematic material glorified by the great masters of the past, has come largely from the humblest origin.

In its original form it has no place in musical education and deserves none. It will have to be transmogrified many times before it can present its credentials for the Walhalla of music.

In musical education Jazz has been an accursed annoyance to teachers for years. Possibly the teachers are, themselves, somewhat to blame for this. Young people demand interesting, inspiriting music. Many of the Jazz pieces they have played are infinitely more difficult to execute than the sober music their teachers have given them. If the teacher had recognized the wholesome appetite of youth for fun and had given interesting, sprightly music instead of preaching against the evils of Jazz, the nuisance might have been averted.

As it is, the young pupil who attempts to play much of the "raw" jazz of the day wastes time with common, cheap, trite tunes badly arranged. The pupil plays carelessly and "sloppily." These traits, once rooted, are very difficult to pull out. This is the chief evil of Jazz in musical education.

On the other hand, the melodic and rhythmic inventive skill of many of the composers of Jazz, such men as Berlin, Confrey, Gershwin and Cohan, is extraordinary. Passing through the skilled hands of such orchestral leaders of high-class Jazz orchestras conducted by Paul Whiteman, Isham Jones, Waring and others, the effects have been such that serious musicians such as John Alden Carpenter, Percy Grainger and Leopold Stokowski, have predicted that Jazz will have an immense influence upon musical composition, not only of America, but also of the world.

Because The Etude knows that its very large audience of wideawake readers desires to keep informed upon all sides of leading musical questions, it presents in this midsummer issue the most important opinions upon the subject yet published. We have thus taken up the "Jazzmania" and dismiss it with this issue. But who knows, the weeds of Jazz may be Burbanked into orchestral symphonies by leading American composers in another decade?

We do desire, however, to call our readers' attention to the remarkable improvement that has come in the manufacture of wind instruments of all kinds and to the opportunities which are presented for teaching these instruments. Jazz called the attention of the public to many of these instruments, but their higher possibilities are unlimited, and thousands of students are now studying wind instruments who only a few years ago would never have thought of them.

Hats Off!

We want to emulate, in one detail at least, another editor of a musical periodical whom we can never hope to even imitate in other ways. When Robert Schumann first encountered the works of Chopin he wrote a laudatory editorial headed, "Hats off, gentlemen! A genius!" We have never seen Shura Cherkassky, the little eleven-year-old pianoforte virtuoso of Russian birth who has lived in America awhile. We have merely heard the excellent talking machine records of his playing that are now upon the market. They indicate maturity, taste, technic, touch and style that come only with real genius. One of his recent records is that of one of his own compositions entitled *Prelude Pathetique.* If this child can do this at eleven, what may he do when he reaches manhood. Certainly Mozart or Mendelssohn never gave any more sensational demonstrations of musical talent. We strongly advise our teacher friends to hear some of these astonishing records—perhaps to keep them in their studios to incite their own pupils to higher efforts.

What Self-Help Really Means

The only thing that really counts in great achievement is what you do yourself with your own talents.

This applies to the student who attends a university or a conservatory as well as to the one who, never having had such advantages, manages to reach up to the zenith over the kinds of things that the world calls insurmountable obstacles.

Mussorgsky never went to a conservatory. Elgar never went to a conservatory. Wagner never went to a conservatory. Thousands and thousands of students who had the most thorough kind of conservatory training have never even approached the accomplishments of these masters.

The conservatory and the university are time-saving, systematic means of securing the right ground-work. They offer the same advantages to all who desire to attend. Fortunate is the student who can have these advantages. He will begin his career with a more thorough understanding and better digital preparation. There, however, the whole process stops; and the "graduate" of a conservatory must realize that he stands a glorious chance of joining the ranks of the failures of the world unless he employs that thing which is the one key to larger success—self-help.

Self-help is *the* thing which will enable you to stand out among men as an individual—not as a cog.

Most students get into a state of academic petrifaction. They are like stone statues waiting for some educational Pygmalion to bring them to life. They never make a move until some one tells them to move. Then, they want to have every step directed. They never accept anything until some teacher or leader brings it to them. They never dream of doing any original thinking for themselves. When they do move they need someone to prod them and lash them ahead like slaves. Slaves indeed they are, slaves of convention and their own lack of initiative.

The Etude presented in the July issue a "Self-Help Course" by means of which any understanding student needing such a course can unquestionably advance very remarkably during two months' intensive work. It requires merely the determination to do the work, and do it well. The expense of the purchase of a little sheet music and a few records will at the most amount to only a few dollars. How many will have the initiative and application to take advantage of this plan instead of deploring the lack of money to go to some Summer School? Of course the average student would do more at a Summer School with fine teachers in person, a systematic course, and the inspiration of fellow students. On the other hand, there will be some eager, earnest students, with the self-help spirit of Wagner, Mussorgsky and Elgar, who will take this course and fit it into their own needs, and at the end of two months they will have accomplished more than many of those who had the superior advantages of the Summer School.

After all, your own success depends about ninety per cent upon YOU.

What Musical Chance Does Your Race Give You?

Is it written in the stars that you are to be a great pianist? Rudolf Breihaupt, eminent European specialist in piano technic, thinks that race is the determining factor. In the July issue we reprinted his article which appeared in *Die Musik* some time ago. This was simply the opinion of a highly intelligent man who has evidently done some little looking about in anthropology. The article was very interesting, and Etude readers found profit and fun in reading it. We agree with Breithaupt only in part. We believe that a good poet is made as well as born. We believe that the whole matter of racial descent and heredity is so involved that in music as in other things it is a matter of individualism and environment as much as race. To read Breithaupt's article it would appear that unless one possesses a share of Slavic, Latin or Jewish blood you are unlikely to become a fine pianist. This is out of alignment with the tenets of modern anthropology, which does not admit these divisions but sets apart the European races into the three general classes: Nordic, the long-headed, blue-eyed blondes that have literally conquered the world; the Alpines, the round-headed plodders of middle Europe, sometimes Slavs, sometimes Germans, often French and even Italian; the Mediterraneans, the intense brunette people in the south. We do agree with Breithaupt in his conclusion that the cross breed often produces the finest results. This gives us hope for the musical future of America, with its many cross breeds but with a main trunk which for centuries will remain Anglo-Saxon in spirit, culture and power.

What One Man Did

When you look at a great electric locomotive tearing across the country at a terrific speed you rarely think of the source of the power, the giant dynamos miles and miles away.

One of the greatest human dynamos of the past one hundred years shut down in March.

This was Orison Swett Marden—all honor to his name!

Marden did not stop his life work until he had stored his force in many powerful books which have had a world-wide circulation.

Marden climbed to his own success by the methods he urged upon others. No mountain was too great to stop him. He failed miserably at one time. The world laughed at him. Marden smiled confidently, found out his mistakes, and came back splendidly.

Marden's books on self-help won him the highest praise from many of the greatest men of his time. His books were translated into many tongues and were as popular in Japan as in America.

Years ago the editor of the Etude was a contributor to Marden's magazine, *Success.* Through correspondence he learned that one of Marden's secrets was that purely material success was really failure; but that success which contributed to the betterment of man was the only kind really worth working for.

Solely by comparison can we estimate the value to the state of the work of a man like Marden. Luther Burbank took ordinary vegetables and flowers and made them magnificent. Marden took the souls and talents and ambitions of men and women and increased their forces a thousandfold, enabling them to achieve things which they hardly dreamed were within their power. Without depreciating the great achievements of the wizard of Santa Rosa, we have an idea that Marden did something of very much greater significance for the men and women of his time.

What Marden accomplished is hard to express in any form of power units. Thousands of prominent men the world over would gladly testify to the great help and inspiration they received from the strong, commonsense optimism of his inspiring mind. Indirectly he added enormously to the wealth and happiness of the world.

We humbly and gratefully lay this little wreath of editorial laurel upon the memory of a great man. May we be permitted to continue through these columns some of the force and power that he generated in the world.

Requiescat in Pace.

What Do You Want to Know?

For forty years The Etude has been the means of communicating expert information upon musical problems to its readers.

It is our ambition to make The Etude as genuinely helpful as possible. In fact, it not infrequently happens that The Etude gives through articles expert information that would cost the individual reader a great many times the price of annual subscription to secure in person.

You have helped us immensely in the past by telling us through thousands of letters what you want to know.

Often we have to tax our editorial imagination to endeavor to divine what you really do want to know.

Why not send us some titles for articles upon subjects about which you desire expert information.

If these titles are those in which we believe a great number of the readers may be interested, we will gladly employ experts to write articles upon them.

Please send us a few of the titles of articles that you would like to see in The Etude. We are running The Etude for *your* personal assistance, *not* to gratify our own whims or theories.

Just sit down to-day and write a letter to the editor, marking it "Etude Title Suggestions," and we will be very grateful to you. Incidentally, you may be helping a great many other Etude readers.

A Word From the White House

"It would be exceedingly difficult to overestimate the important part that teachers take in the development of the life of the nation. They exercise their art not on the materials of this world, which pass away, but upon the human soul, where it will remain through all eternity. It is the teacher that makes the school, that sets its standards, and determines its success or failure. . . . It is not too much to say that the need of civilization is the need of teachers. The contribution which they make to human welfare is beyond estimation."

—Calvin Coolidge.

The Showdown

All photographs are likenesses—more or less. Some photographs are very poor likenesses. Some people photograph exceedingly well. The moving picture operators know this better than anyone.

The same is true to a certain extent of the phonograph. Some voices record exceptionally well; others are less effective.

The musical art of the performer, the nuances, the rhythm, the mood, the character, the phrasing, all are wonderfully preserved. This has become a significant fact to great artists who permit their performances to be recorded. With the player piano records it is possible, by means of careful editing and cutting, to change a roll so that it comes nearer the player's ideal interpretation. Very often artists do this most successfully. With the phonograph, however, the record must stand unchanged.

The musical public can thereby ascertain how much of the appeal of the artist may be due to the artist's personal ability, his "magnetism," the dim lights, the enthusiasm of excited admirers; and how much to the real music itself. Sometimes the comparison, the "showdown," is a brutal revelation of the truth. We know of the instance of two pianists, one of international fame, the other far less known and less honored, who played for the same recording company the same composition of a great master. The interpretation of the lesser-known pianist outpoints that of the man of great fame in many, many details. It indicates a loftier conception and higher degree of musicianship. Which, then, is the greater artist? The gentleman with the glamour or the gentleman with the proof of his ability?

Where Is Jazz Leading America?

Opinions of Famous Men and Women in and out of Music

GEORGE ADE

American Humorist and Satirist

The cruder form of "jazz," a collection of squeals and squawks and wails against a concealed back-structure of melody, became unbearable to me soon after I began to hear it. Good syncopation is legitimate and probably enjoyed to the limit by many people who are slow to admit the fact It has been evolved naturally from negro songs and dance tunes and is the characteristic American music, if we have such a thing. For a long time I applauded syncopation and frowned on "jazz" but now I am free to admit that some of our arrangers and directors have been so clever in producing harmony while flirting with discord that I am almost converted to certain kinds of "jazz."

It can be a dreadful disturbance to the atmosphere when perpetrated by a cluster of small-town blacksmiths and sheet metal workers but it becomes inspiriting and almost uplifting under the magical treatment of Paul Whiteman, and some of his confreres.. If the Paul Whiteman boys play "jazz" then I am in favor of that particular variety of "jazz" but, at the same time, I suggest that every rag-time artist should be compelled to take an examination and secure a license before he is permitted to fool with a saxophone.

MRS. H. H. A BEACH

Renowned American Composer-Pianist

In reply to your letter asking my opinion of jazz and its influence on the country, I can only say that my knowledge of it is very limited and I do not feel competent to pronounce judgment on it. Working as hard as I do in my own way, either in concert-playing or composition, I have few opportunities to attend theaters or concerts, to my great regret. When such rare pleasures come my way I naturally choose something that will give me the greatest possible uplift in a few hours, or even minutes; something that will inspire and strenghten me, not only in music but also help me to face life and its problems in a sweeter and braver spirit. From the little that I have heard of jazz, I should hardly class it among such influences for good. If it is merely a question of interesting new rhythms, accompanied by weird harmonies and suggested by lilting melodies, no one could appreciate the charm of such combinations more fully than I, provided that the work is good throughout. Taken, however, in association with some of the modern dancing and the sentiment of the verses on which many of the "jazz" songs are founded, it would be difficult to find a combination more vulgar or debasing. After all, perhaps, it may be like many other things in life; that, used in moderation can do no harm or may even do positive good, used to excess their influence may be only pernicious to the last degree. The future will determine the exact place in music, to be occupied by jazz, whether it is merely a joke or a force that can be utilized in a legitimate way for the glory of art.

Shall we be content to flavor our food with pepper, or is our future diet to consist entirely of Tabasco sauce?

FELIX BOROWSKI

Well-Known Composer and Educator

I do not see anything particularly pernicious in "Jazz." It would seem that the disapproval which has been bestowed upon it has been the result of the dancing which has accompanied jazz rather than the music itself. Evil

VINCENT LOPEZ AND HIS PENNSYLVANIA HOTEL ORCHESTRA

communications corrupt good music; and in its own special department jazz is often as "good" as a waltz by Strauss. For, after all, the highest office of really fine dance music is the incitement to dance. That the bizarre *movements* which pass for dancing now-a-days are more suggestive of suggestiveness than anything else is, of course, deplorable; but jazz is only indirectly to blame for such conditions. I find in this form of music something peculiarly American—our restlessness, for instance. Whether jazz could or should be used in what are generally considered serious compositions depends largely upon the composition and upon the person who writes it. Tschaikowsky, Borodin, Glazounow and others used Russian dances in their symphonies and chamber music; there is no reason why an American composer should not employ his own dances—if only he does it well.

CHARLES WAKEFIELD CADMAN

Noted American Composer

Candidly, I think too much importance has been placed upon this question of Jazz; too much worry has been given it. It is as silly to stir oneself up over the matter of jazz as it is to get into a fever heat over modern Christianity and Fundamentalism. Attacking jazz can do no good. Championing jazz only makes one ridiculous. I feel the best way to meet this problem is to meet it with the open mind. By that I do not think it is necessary to do any straddling.

Simply recognize the fact that jazz is an exotic expression of our present national life. The very fact of its form changing every year shows its impermanence. Its very rhythms and its fantastic effects, which are not without cleverness (because a good musician is usually called in to orchestrate the rather crude piano scores) somehow reflect the restless energy that pulses through the "spirit of the day," a restlessness that has become most patent since the World War. Jazz makes a more popular appeal at this moment than it would make at a more quiescent period of history. It is the craving for excitement on the part of those who can understand only the more popular forms of music, in other words, those who fancy the savage in music because it brings them a "kick."

It is true, indeed, that there are many who never get beyond the appreciation of jazz, but I am inclined to think that there are thousands who grow tired of the ever-recurring agitated forms and soon search for music with a deeper significance. Jazz is not peace-bringing; jazz is not spiritual, nor is jazz very uplifting. Its very lack of thoughtfulness (save in the rhythmic patterns it employs) and a lack of repose, make it *exotic*. Yet, do not let us overlook the fact that many classic tunes which have been pilfered bodily or even in a fragmentary manner and treated jazzily, have led to the understanding and appreciation of the original versions on the part of the most ardent jazzites. I have seen this to be true in cases under my consideration. The fact that the quality of jazz has improved greatly the past few years and that well-trained musicians are able to listen and smile and enjoy the cleverest of it, leads me to feel that we have nothing to be afraid of, and that the problem will take care of itself through natural evolution. Let us accept any "color effects" it has brought us and leave the pathological and psychological aspects to be worked out through the aforesaid evolution, which has ever and *shall* ever, find *new* expressions and forms in each succeeding day and generation.

JOHN ALDEN CARPENTER

Distinguished American Composer

Replying to yours of the 2nd, I am afraid that I shall not have time to do justice to the theme; but I should like to be allowed to go on record as deprecating the tendency to drag social problems into a discussion or contemporary popular American music.

All music that has significance must necessarily be the product of its time; and, whether we believe that the world of to-day is headed toward Heaven or Elsewhere, there is no profit in any attempt to induce the creative musician to alter his spontaneous mode of expression in order that he may thus affect the contemporary social conditions. Nor shall we make any better progress by attempting to legislate contemporary American music out of popularity by resolution of clubs or civic bodies.

I am convinced that our contemporary popular music (please note that I avoid labeling it "jazz") is by far the most spontaneous, the most personal, the most characteristic, and, by virtue of these qualities, the most important musical expression that America has achieved.

I am strongly inclined to believe that the musical historian of the year two thousand will find the birthday of American music and that of Irving Berlin to have been the same.

DR. FRANK DAMROSCH

Director of the Institute of Musical Art

Jazz is to real music what the caricature is to the portrait. The caricature may be clever, but it aims at distortion of line and feature in order to make its point; similarly, jazz may be clever but its effects are made by exaggeration, distortion and vulgarisms.

If jazz originated in the dance rhythms of the negro, it was at least interesting as the self-expression of a primitive race. When jazz was adopted by the "highly civilized" white race, it tended to degenerate it towards primitivity.

When a savage distorts his features and paints his face so as to produce startling effects, we smile at his childishness; but when a civilized man imitates him, not as a joke but in all seriousness, we turn away in disgust.

Attempts have been made to "elevate" jazz by stealing phrases from the classic composers and vulgarizing them by the rhythms and devices used in jazz. This is not only an outrage on beautiful music, but also a confession of poverty, of inability to compose music of any value on the part of the jazz writers.

We are living in a state of unrest, of social evolution, of transition from a condition of established order to a new objective as yet but dimly visualized. This is reflected in the jazz fad. We can only hope that sanity and the love of the beautiful will help to set the world right again and that music will resume its proper mission of beautifying life instead of burlesquing it.

FRANZ DRDLA

Violinist and Composer of the Famous Souvenir

(Drdla, the well-known Checo-Slovak composer and violinist has recently toured America as a star artist in the Keith circuit. Naturally he heard a great deal of Jazz. Since he has appeared repeatedly in Europe with many of greatest musicians of his time, including Johannes Brahms, his opinions upon Jazz given to the Etude at this time are most interesting. Mr. Drdla is best known as the composer of the immensely popular *Souvenir*. He has just taken out his first papers as an American citizen).

Every time and every age has its characteristic music precisely as it has its characteristic dress. In the Days of the Madrigal, the very character of the words and the text reflect the architecture and the attire of the times. Jazz is the characteristic folk music of modernity and because America is the most modern country of the world. It is, however, an expression of the times and it is not surprising that Jazz should rapidly circulate around the globe like the American dollar.

Folk music of this type (if you want to call the artificialities of Jazz folk music) seems to spring into existence after times of great deprivation such as those that accompany great wars. The Waltz, for instance, seemed to spring into international currency just after the French Revolution, as a kind of irrepressible expression of joy and liberty from restriction. Later on came the polka; then, after the Franco Prussian War, seemed to be an outburst of the hilarious *can can* in Paris. The world was putting aside its tragedy for a spree.

At the end of the great war, American ragtime simply went wild and that was Jazz. Like many things it proved very infectious and soon the whole world was inoculated. European nations should not condemn American Jazz as long as its perpetrators seem to enjoy it even more at times that the native Americans.

Much of the Jazz I have heard seems to be in two-four rhythm. It rarely appears in the three-four rhythm. This in itself, with some of the very monotonous background rhythmic figures, makes Jazz very boring at times. It lacks variety in rhythm and metre although it tries to make up for this by introducing all sorts of instrumental color from every imaginable instrument that can be scraped, plucked, blown or pounded.

ARTHUR FOOTE

Famous American Composer

I have unluckily no acquaintance with "Jazz" in its finer and more refined form. It does seem a thing that easily turns in the direction of commonness and that can have a bad influence in music. The Ampico and other instruments that reproduce music by means of mechanism, I am sure do lead their hearers to better appreciation of good music—in fact constitute a very important part of such influences. It seems doubtful if "Jazz" can be counted on for anything of the sort. The truth may be that it is becoming increasingly difficult to find melodies and harmonies that are fresh (not to say new), that this interest in "Jazz" means exploration of new and striking rhythmical dances—odd, but after centuries of musical development we should be returning to the primitive.

HENRY F. GILBERT

Distinguished American Composer

[Mr. Gilbert, in response to an Etude inquiry, suggests the following quotation from an article he wrote for *The New Music Review* upon this subject.]

"Concerning Jazz":

"Is Jazz a new kind of music? Has it anything to contribute to the art? I find that almost all pieces of so-called Jazz music, when stripped of their instrumentation (*i. e.*, the instruments upon which they are played: saxophones, muted trombones, etc.), have almost nothing new to offer in the way of strictly musical interest. And this is so, even when we consider jazz from a strictly 'popular' standpoint.

"The amount of purely musical value, and the amount of differentiation of this music from other 'popular' music, can be noted by playing a piece of jazz music on the piano. It is true that for several years the rhythmic element in popular music has been growing more insistent and nervous, and it may have reached its culmination in jazz. I rather think it has. So, as far as simple rhythmic forcefulness and iteration are concerned, jazz can claim the proud distinction of being the 'worst yet.' Technically speaking, however, it must be granted that the popular music of to-day is far richer in contrapuntal devices, in harmony, and in figuration than popular music formerly, in which the interest rested *alone* in the melody.

"Another point by which jazz may be distinguished from the popular music of the olden time—say ten years ago—is the large number of cat-calls, clarinet-couacs, smears, glides, trombone-glissandos, and agonizing saxophonic contortions which occur in it. But these things are largely rendered possible by the instruments upon which jazz music is played. Take away these instruments and you take away the jazz quality almost entirely. In fact this jazz quality, far from residing in the music itself, is almost wholly a matter of tone-color, and this tone-color is given to it by the instruments—unusual instruments—and not only unusual instruments but also unusal combinations of instruments. For instance who ever thought of writing for a combination of saxophones, banjos, and muted trombones before? Yet in this, and similar combinations, lies most of the jazz effect in my opinion. Take many a piece of classical music—like some of Grieg's pieces, Dvorak's Slavonic Dances, or even some of Mozart's or Beethoven's compositions—and let a good jazz arranger arrange them for the usual jazz orchestra, with all its freak combinations of instruments—and let the arranger not change the original music more than is ordinarily done in transcribing a piano piece for an ordinary orchestra—and I would bet ten to one that it would be received by the majority as a new and authentic piece of jazz music.

In the unusual instruments—their unusual combination—the manner of playing them—the grotesque and burlesque effects which are obtained; in all this lies, for me, the interest in the phenomenon of jazz—*not* in the music. A great deal of my interest in it is purely humorous. By means of these above listed grotesque effects jazz 'takes off' or 'makes fun of' certain well-known phrases or legitimate methods of procedure in the respectable and established art of music. Jazz rings true in its Americanism in that it insists on laughing and making fun of even the most serious and beautiful things. It is a kind of musical rowdy, and occupies the same relation to the Art of Music that 'Burlesque' (on the stage) does to the 'Legitimate Drama.' It can certainly be very funny, and I for one, and I believe many more, have thoroughly appreciated the wit and skill of certain 'take-offs.' A little musical nonsense now and then is relished by the best of musicians. One night at Ziegfeld's midnight frolic—but the mere recollection of the way the saxophone caricatured a coloratura opera-singer is enough to make me laugh 'fit to split,' as the saying is.

(A word about the saxophone. This instrument may be said to be the principal instrument in the jazz orchestra. It is so much in evidence here, and so little in evidence in the regular symphony orchestra, as to give many persons the idea that it is a special development of jazz. But the saxophone was invented by Adolph Sax, in Paris, about 1840. Meyerbeer, Massenet, Bizet, Thomas, and many others have written for it. Bizet has written for this instrument a naive and pastoral melody of much beauty, in his music to Daudet's drama, "L'Arlesienne." However, it has never become an integral part of the standard symphony orchestra. It has always remained a special instrument, used on occasion to impart its rich and expressive tone-color to certain isolated phrases or melodies. It has remained for jazz to exploit it. And this has been done in a way to make the angels weep (with laughter). Originally [illegible] instrument having a richly pathetic and lyrical tone quality, it has been made to perform all sorts of ridiculous stunts, amounting to an indecent exposure, of all its worst qualities. It is as if a grave and dignified person were forced to play the part of clown at the circus).

"Nevertheless, all these grotesque and burlesque 'effects' on the saxophone, trombone, clarinet, and other instruments; the unusual combination of tone-qualities; and,

Learning to Memorize

A Pianoforte Lesson

By F. CORDER

Professor of Composition, Royal Academy of Music, London, England

(*A pupil comes for her first lesson with the new teacher and sidles into the room in the usual awkward fashion.*)

T. Miss A—, is it not? Well, what are you going to play me?

P. Oh, I haven't brought my music; I thought—— (*pauses.*)

T. Never mind; play me anything you can remember; it doesn't matter what.

P. Oh, I can't remember anything; I never could memorize.

T. Have you ever tried?

P. Oh, no; but I'm sure I couldn't. It's no use trying.

T. How can you be sure if you never tried? I heard you recite a long poem the other day. You remembered that perfectly.

P. Oh, poetry is quite a different thing; anybody can remember poetry.

T. Well, what is the difference? I should have thought it harder. You have no fingers to help you.

P. Oh, well; one knows what it is about at all?

T. And don't you know what your music is about? Don't you know anything about music?

P. Oh, no. (*Vaguely.*) I'm very fond of music.

T. I should have thought you would find it rather a dull business if you don't understand it. But never mind, we will try to improve, won't we?

P. (*Evasively.*) Oh, hadn't I better get my music?

T. It will perhaps save time if we try this. (*Opens a volume at random, as it would seem.*) Suppose you try to play——.

P. (*Alarmed.*) Oh, I can't read. (*Sees the title.*) Oh! Beethoven's "Moonlight Sonata!" I know that!

T. Yes, I Sherlock-Holmesed that. (*Mentally quotes, "You know my methods, Watson."*)

P. (*Not in the least comprehending.*) Oh!—(*timidly.*) Shall I——?

T. Yes, please. You won't mind if I stop you unexpectedly?

(*Pupil plays the opening measures of the first movement. Just at the last group in the fourth measure the Teacher grasps her right hand and prevents her playing the last two notes.*)

P. Oh! What did I——?

T. You didn't, but you were just going to. What note was your middle finger about to play?

P. Oh! (*Stares at the copy.*) Why, B.

T. Yes. Would that have been right?

P. Oh, wouldn't it?

T. What key is this piece in?

P. Oh, four sharps.

T. E major or C sharp minor?

P. (*Turns over leaf and looks at last bass note.*) Oh, C sharp minor.

T. Yes, but was it necessary to look at the ending to tell that?

P. Oh, why—that's the way I was taught.

T. Quite right as far as it goes; but if you do not know until it is all over whether you were in E major or C sharp minor, you will probably have played plenty of wrong notes. Now, listen! (*Plays the fourth measure, as pupil was doing, with B natural.*)

P. Oh, that sounds wrong!

T. Yes, you notice it when I play it; but why do you fail to notice it when you play it yourself?

P. Oh, because I was careless, I suppose.

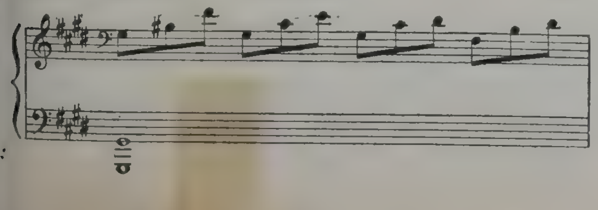
T. No, I don't think that was the reason. In the key of C sharp minor what is the note next below the key-note?

P. (*Looking at the keyboard.*) Oh—er—C natural.

T. (*Groans inwardly.*) B sharp. (*Has great difficulty in not adding, "You noodle."*) Have you never learned the names of the notes?

P. Oh, yes. I remember; I learned my Rudiments, but I have forgotten them.

T. I have no doubt of it. One only remembers what one *wants* to remember. Now, listen again, and play this. (*Shuts up book and plays.*)



P. (*Plays it quite correctly.*)

T. So you perceive that you can memorize.

P. Oh, just that little bit, that is nothing.

T. But clearly, if you can memorize one measure you can memorize a whole piece. (*Reopens the volume.*) Now, if you don't mind we will try again.

P. (*Plays the four measures again, with her eyes intently fixed upon the copy. On coming to the fourth measure she plays B natural.*) Oh, I believe I played B natural. I am so sorry.

T. Are you sure that you played B natural? Did you hear it?

P. Oh, I am not *sure.* Didn't I?

T. You did, but doesn't it strike you as strange that you didn't hear what you played?

P. Oh, I am afraid I often don't.

T. But why?

P. Oh, I don't know. Inattention, I suppose.

T. You cannot think you were inattentive; you were staring hard at the copy all the time. Tell me, to which of our senses does music address itself?

P. Oh, to the ear, of course.

T. And I suppose you are not aware that it is extremely difficult to use any two of our five senses at once.

P. (*Astonished.*) Oh! Is it?

T. This is proved by the fact that when you had no copy before you you played that note quite correctly, but when you were intent upon looking at the page you could only *see* and not *hear,* as you admitted; consequently your finger made the mistake which I am sure it has made ever since you first played the piece.

P. Oh, surely not?

T. And what makes me think that is so?

P. Oh, because the accidental isn't marked in, you mean. I wish they would call it C natural, and have done with it.

T. That would do no good; you would only transfer the difficulty from one note to another. Of course you would make the piece much easier to *read* if you marked in the ♯ to the B yourself, but don't you perceive that music is not intended to be read afresh every time it is played, but learned by heart?

P. Oh, I thought I knew that movement by heart. I've played it often enough.

T. You may read it all the days of your life, without knowing a single note of it. What about the *sound* of it? You admit, yourself, that you don't hear what you play. Why not give yourself a chance and dispense with having to gaze at the copy in that agonized way?

P. Oh, indeed, I couldn't memorize three whole pages, not if I tried for weeks.

T. You have shown that you can memorize one measure and, if one, then, as I say, why not sixty? Besides, what you take to be three pages is really nothing of the kind. If you took sufficient interest in music to find out how it is made, how and why certain portions have to be repeated, what the pattern of the accompaniment is, and so on, you would find memorizing both easy and delightful. At present, not knowing these, memorizing will have to be mechanical, but you cannot have played any music without noticing plenty of repetitions. That helps.

P. Oh, yes! But, I really couldn't.

T. Well, let us struggle along, then. (*Pupil plays, with more or less success, down to the end of the first page. As the Teacher does not turn over she stops dead in the middle of an arpeggio.*) Couldn't you finish that passage unless I turned over?

P. Oh, no! But I generally have someone to turn over when I play.

T. And if that person is also unable to use her eye and ear together and makes a mess of it—?

P. Oh, then I have to stop and do it myself.

T. Which gives you away to the audience. Don't you see here the advantage which memory would give you?

P. Oh, yes; but it's of no use; you don't know.

T. But they told me you were quite a clever girl.

P. (*Simpering.*) Oh, perhaps in other things I am not so bad, but I have no musical memory; never had.

T. (*Driven to his last resource.*) But you can't think how silly you look, staring at the music with your mouth open and your eyes ready to drop out under the strain.

P. (*Horrified.*) Oh! You don't really mean that?

T. (*Rubbing it in, maliciously.*) It does seem a pity, doesn't it, when one is really intelligent and—and interesting, to sit there looking like an id— (*checks himself*) well, like nothing earthly, and all for what? You can hardly read at all, you say, so all the staring in the world won't even help you to play the right notes, much less render the music. It is pure habit; pernicious habit, that prevents you from hearing and thinking. Won't you try to substitute for it a different habit; the habit of playing by ear, so that you will at least always be able to hear mistakes. And then you will look your normal self.

A girl ought to look her best when playing the piano. Remember what the poet says:

> "Sweet maid, be clever; let who will be good.
> What though the finger fail, the music halt,
> Letting 'I dare not' wait upon 'I would.'
> Look nice, the audience then will find no fault."

P. (*Earnestly.*) Oh, indeed—indeed I will try. But how shall I begin?

T. The same way as you learn your poetry. Not trying to learn it all at once, but taking a few measures at a time, noticing where there comes a partial or complete stop—this is where your knowledge of Rudiments would help you if you hadn't forgotten it.

P. Oh, I'll learn it again. I will, indeed. I must, I will learn to memorize.

T. It is, as I say, a habit; consequently you will find it easier and easier as you proceed. It cannot be so very difficult if even little children manage to do it. Besides, when did you ever see a pianist of any pretensions at all, play with her music?

P. Oh, I know, of course. Will it do if I bring you that movement really memorized by next week?

T. Well, try, at any rate. And so "here endeth the first lesson!"

P. (*Shocked.*) Oh!

* * * * *

A week later. Pupil comes in with a smiling and confident air.

T. Well; so you have succeeded in memorizing those three pages?

P. (*Innocently.*) Oh, how did you know?

T. I hope the result will prove as satisfying as you think it will.

(*Pupil sits down and endeavors to play the first movement of the "Moonlight Sonata." Beginning quite correctly she gradually increases the pace, until after about four lines it gets so fast that she stumbles and comes to grief.*)

P. (*Vexed.*) Oh, bother! And indeed I played it through without a mistake just before you came.

T. Well, what caused the break-down then?

P. Oh, I suppose I wasn't thinking.

T. That I can't say; but you were not *listening.* Surely you didn't want to scurry along like that. Funny sort of moonlight, what?

P. Oh, did I hurry? My fingers ran away with me.

T. As they always will do if you allow them. Surely it is for you to set the pace and make the music. Fingers have no sense; they only want to hustle along and get through. So long as you listen you simply can't help playing nicely; cease using your ears and there is no music any longer, only noise.

(*Pupil tries again, and after several attempts succeeds.*)

Now because you have learned that easy movement you must not suppose that you can always play it. Whenever you fail to control your fingers, whenever you allow them to play automatically, all the mistakes you have ever made will creep back and you will play like a pig instead of a little christian. Listen, *listen,* LISTEN, all the time.

P. Oh, there is something I want to ask you, professor. I still find it so difficult, memorizing; how can I learn more quickly?

T. Well, I can tell you one simple trick which is more helpful than you would believe. Place the copy on the top of the piano so that you have to rise from your seat every time your memory fails you. The trouble of doing this is so vexatious that you put your utmost constraint upon your mental powers, with excellent results.

P. Oh, what a good idea!

Where Is Jazz Leading America?

(Continued from page 518)

the invention thereby of new and unheard-of effects; I consider to be the most distinctive feature of the phenomenon called jazz. While this is not a specifically musical distinction, it is, considering the worldwide success of this music, and the remarkable quality of some of these 'effects' pregnant with suggestion for the serious American composer."

JOHN LUTHER LONG

Eminent Author Dramatist

The uncompromising radical is always wrong—especially in matters of art—and most especially in an art which must be delicately adjusted to our times, environment, and emotions. However, the radical justifies his existence by usually "starting something" which saner intelligences fashion into something else—less radical, more beautiful, yet still novel, and characteristic of the times and manners of now—in a more approachable manner than static music. This seems to be precisely what is taking place in the Jazz of now—as witness such distinguished prophets of the new order as Dr. Stokowski, John Philip Sousa, and Paul Whiteman. In fact the process seems to be one of evolution and then revolution. For, we have had always some form of "Jazz." (The typewriter can only recall at the moment a certain jazzy lullaby whose name it does not mention because it has forgotten it, but which it still whistles sometimes—stealthily—when the neighbors are all surely asleep.) So that if I happen to be correct (as I sometimes am) the present overweening Jazz has been envolved out of such inchoate jazzeries as I have (not) mentioned tentatively and, being found artistically imperfect, is now being revolved back to the happy middle which is always sound. One thing is certain: The world loves and will practice Joy; and in Jazz there is Joy! Whether we shall have it in its most unfettered, ribald form, the African Ho-Down, or in the sophisticated form of that same medium, chastened by humor, tragedy, tenderness or beauty is the issue now trying.

VINCENT LOPEZ

Mr. Lopez is at the head of the famous orchestra at the Hotel Pennsylvania in New York. The reported action of French authorities in prohibiting Jazz, and thereby making it impossible for certain American players to perform in Paris, has incited Mr. Lopez to wire urgent messages to Secretary of State Hughes, and to Senator Copeland, suggesting that as a reciprocal measure America cut short its hospitality to non-American musicians.

"I have been for a long time making a study both of the word 'jazz' and of the kind of music which it represents. The origin of the colloquial word jazz is shrouded in mystery. The story of its beginning that is most frequently told and most generally believed among musicians has to do with a corruption of the name 'Charles.' In Vicksburg, Miss., during the period when rag-time was at the height of its popularity and 'blues' were gaining favor, there was a colored drummer of rather unique ability named 'Chas. Washington.' As is a very common custom in certain parts of the South he was called 'Chaz.' 'Chaz.' could not read music, but he had a gift for 'faking' and a marvelous sense of syncopated rhythm. It was a practice to repeat the trio or chorus of popular numbers, and because of the catchiness of 'Chaz's' drumming he was called on to do his best on the repeats. At the end of the first chorus the leader would say:

"Now, Chaz!"

"From this small beginning it soon became a widespread habit to distinguish any form of exaggerated syncopation as 'Chaz.' It was immensely popular from the start, for it had appeal to the physical emotions unobtainable from any other sort of music. 'Chaz' himself had learned the effectiveness of this manner of drumming through following the lead of country fiddlers in their spirited playing of 'Natchez Under the Hill,' 'Arkansaw Traveler,' 'Cotton-Eye'd Joe,' and the numerous other similar tunes so dear to the hearts of quadrille dancers.

"In my endeavors to place a finger on the exact spot in music that we can 'jazz,' I found a process of elimination very convenient. There are many movements in the greatest symphonies that are syncopated; yet by no stretch of the imagination can we call them 'jazz.' The weird music of the North American Indians, based on sing-song vocal melodies with tom-tom accompaniment, is bizarre enough; but it is not 'jazz.' The Oriental whine of the musette, as used for the dances of the whirling Dervishes, cannot be called 'jazz.' The languid airs of Hawaiian origin are not in that category. A Strauss waltz, a Sousa march, the gayest tune of a Gilbert and Sullivan light opera, an Argentine tango, a minuet, polka, quadrille, bolero, none of these are jazz;' and yet any or all of them can be made into 'jazz' by the simple expedient of accentuating that beat which the natural laws of rhythm require to be unaccented.

"The whole universe is founded on order and rhythm, on regularity and steady tempo. The music of the spheres rushing through space is undoubtedly in strict time; the seasons change on schedule; all astronomical calculations are possible because of the methodical regularity of recurrent events. It is entirely contrary to natural laws to syncopate, and only man does it. The music student has difficulty in acquiring this faculty, for he feels that it is inherently wrong. No wild animal gives a long-drawn cry but that it is in time. When a baby does not cry rhythmically a doctor or a mother immediately realizes that something is seriously the matter with the child. When the wrong beat is accented there is an actual physical effect on the hearer, for a law is being broken.

"At the very beginning 'jazz' meant 'without music' or 'contrary to music,' but a great change has taken place in it. The 'jazz' of war times has very definitely departed, although leaving its indelible mark on music as a whole, it fitted a hysterical period when the times were out of joint and a frenzied world sought surcease from mental agony in a mad outbreak of physical gymnastics. There was a time not long ago when anything odd and fantastical in music was labeled 'jazz.' The musicians became affected with the glamor of syncopation. The different instrumentalists began to imitate the antics of the drummer. It became a clamor, an uproar. The clarinet whined and whistled; the trombone guffawed grotesquely; the trumpets buzzed and fluttered; the pianist gyrated.

"It developed into a contest to attract individual attention. The violinist caught the germ and debased his instrument through the most flagrant musical indecencies. We had orchestras a bunch of acrobatic maniacs to whom music was entirely secondary and mummery was the word. The cowbell reigned supreme. And that was 'jazz.'

"It is certainly a misdemeanor to call my orchestra, or any other good dance organization, a 'jazz band,' if taken in the sense of what a 'jazz band' used to be. Present day dance music is as different from 'jazz' as day from night. Yet the word remains with us; and we do stress syncopation, but we do it musically. It is now combined with the finest arrangements money can buy, the richest chords and modulations that gifted musical minds can conceive and the total elimination of all instruments and effects not of proven musical worth.

"Ragtime music was the direct forerunner of 'jazz.' It was so nicely adapted to a simplified form of dancing that it had an almost universal appeal. It was merely syncopation without any particular emphasis. As the emphasis was added it became 'jazz.' It is, therefore, sufficiently explicit, so far as the music is concerned, to define 'jazz' as emphasized syncopation; but there is another phase of it that includes the dancing in combination with emphasized syncopation.

"Because there seems to be something animal-like in the emotional effects of 'jazz,' we have turned to animal movements to get a name for it. We have had the 'turkey trot,' the 'elephant glide' the 'camel walk' and countless other designations; but at last and apparently accepted permanently the 'fox trot.' Perfection of lithesome, graceful bodily action in faultless rhythm can hardly be better pictured than by the harmonious movement of a fox as he trots. There is an almost imperceptible hesitation as each foot is placed, a perfect timing that is exact balance and the very acme of equilibrium. The name fits both the dance and the music."

WILL EARHART

Director of Music, Pittsburgh, Pa.

I rather welcome the opportunity to express myself on the subject of "Jazz" although nobody believes what anybody else says about it. I don't like "Jazz" and don't approve of it. My reason for not liking it is that it does not come pleasingly to my ears. Mozart said somewhere—I think in a letter to his father—something to the effect that even in the most terrible situations in opera, music should never cease to be pleasing to the ear. I am willing to concede a place for rough sounds in opera—*Alberich's* cry is drama if it isn't music—but when music is standing for nothing but sounds and patterns of sounds, I prefer the sounds to be pleasing rather than exciting.

I do not approve of "jazz" because it represents, in its convulsive, twitching, hiccoughing rhythms, the abdication of control by the central nervous system—the brain. This "letting ourselves go" is always a more or less enticing act. Formerly we indulged it in going on an alcoholic spree; but now we indulge it by going (through "jazz") on a neural spree. Just now, the world does not know where to look for some stable principles to cling to, has lost its confidence in the value of ends that it formerly believed in, has been greatly excited, and consequently is not in position to exert the poise and purposeful control that mark the man or the nation that has steadfast ideals, believes in its destiny, and firmly advances toward it. Restlessness, indecision and excitement are characteristic of the interim before we again find compelling aims. "Jazz" is symptomatic of this state.

Since it is a symptom, I am not very much worried about it. It will disappear like all things that are not sound and fundamental always have disappeared, and always will. It is a little irritating—when it is not amusing—to hear it justified because it is dynamic, forceful, energetic. A man in an epileptic fit certainly loosens a large amount of energy; but it is ludicrously foggy thinking to appraise such energy as strength. Energy or force has no value except as it is well controlled and purposefully directed. "Jazz" certainly proves that Americans possess nervous energy. It does not prove that they are safe with it. We have made the mistake before of assuming that fussy, uncontrolled energy meant strength, and we are making it again now.

"Jazz" is defended sometimes because, in its later manifestations, well trained musicians have put some real interest of musical thought and design into it. Such bright spots of the kind that I have noticed are merely intermittent. They usually appear as oases with a desert of drivel before and another following. Their effect, to me, is that of a voo-doo dancer suddenly shouting out some witty epigram and then relapsing to his primitive nature.

Perhaps everything must be judged by the company it keeps—and attracts. Bach fugues, Beethoven symphonies, works by Debussy and Ravel are heard in certain places and received by a certain clientele gathered there. They seem to be appropriate to the places in which they are heard, and to the people who gather to hear them. So does "Jazz."

LT. COM. JOHN PHILIP SOUSA, U. S. N. Rt.

Famous Composer—Conductor

"Jazz, like the poor, are ever with us."

I heard a gentlemen remark, "Jazz is an excellent tonic but a poor dominant."

It is unfortunate that the newness of the term has not allowed lexicographers time to define it properly. My Standard Dictionary gives forth, "Jazz:—Ragtime music in discordant tones or the notes for it."

This is a most misleading meaning and far from the truth and is as much out of place as defining a symphony when murdered by an inadequate and poor orchestra, "as a combination of sounds largely abhorrent to the ear."

Jazz can be as simple in construction and as innocent of discord as a happy child's musings, or can be of a tonal quality as complex as the most futuristic composition. Many jazz pieces suffer through ridiculous performances, owing to the desire of a performer wishing to create a laugh by any means possible. Sometimes it has as little to do with the composition as the blast of a trombone, or the shrieking of a clarinet in "Traumerei" has to do with the beauties of that composition; it simply makes it vulgar through no fault of its own. Jazz, as far as my observation goes, is simply another word for "Pep" and has a counterpoint in the written drama of "hokum" although that word has not been honored with a line of explanation or definition in either my standard or my slang dictionary.

There is no reason, with its exhilarating rhythm, its melodic ingenuities, why it should not become one of the accepted forms of composition. It lends itself to as many melodic changes as any other musical form. Forms go by cycles. There was a time when the saraband and the minuet occupied the center of the stage, and to-day the fox trot, alias jazz, does, and like the little maiden:—

"When she was good she was very, very good
And when she was bad she was horrid."

More About The Jazz Problem

Please don't imagine that The Etude has gone "Jazz-Mad." We are merely discussing the problem because it has become a vital question all over the world. The Etude will continue true to its lofty ideals and "up-to-date" enterprise. In the next issue we shall conclude the Jazz Problem with a remarkable discussion of the subject by the famous pianist-composer, Percy Grainger. Also short noteworthy opinions by Geoffrey O'Hara, Prof. Walter R. Spalding of Harvard, Clay Smith who tells in fearless words the real truth about the odious origin of Jazz, Fred Stone, famous comedian, Paul Specht and Meyer Davis well known orchestra leaders, Robert M. Stults, composer of a song that has sold 3,000,000 copies, Dr. Leopold Stokowski, Booth Tarkington, Rabbi Stephen Wise and others.

The Story of the Trill, or Shake

By ORLANDO A. MANSFIELD, Mus. Doc.

You Will Play All Trills With Greater Interest After Reading This Instructive Article

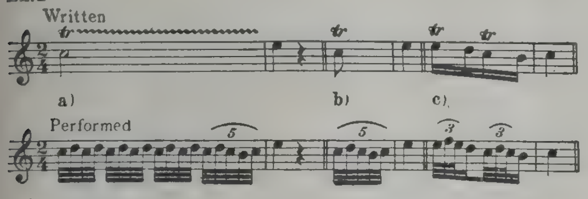
THE Trill, or Shake, is defined as "A rapid repetition of the Principal (written) Note and the Upper Auxiliary (note above) Note, and is denoted by the sign *tr.* placed above the note to be trilled, and followed by a wavy line to indicate the duration of the ornament. When followed by an accented note the trill generally ends with a turn.

(a) Over a short note the wavy line is omitted and the trill consists of a turn.

(b) Or it may be merely a triplet.

(c) A trill must always ends on the principal note and must occupy the full time of the latter.

Ex.1



An ornament which has been described by the late Dr. Hugo Riemann (1849-1919) as "the chief and most frequent" of all musical embellishments, may reasonably be expected to have a somewhat interesting history. In this respect at least the records of musical progress and notation do not altogether disappoint us. Indeed the early history of this ornament is bound up with that of the establishment of the opera and the oratorio. One of the most distinguished names associated with the former was that of Giulio Caccini, *circa* 1558-1599, a Roman in the service of the Grand Duke of Tuscany. To Caccini, in conjunction with Jacopo Peri (1561-1633), we owe the composition of the first operas,—Dafne, in 1594; and Euridice, in 1600. Although properly remembered to-day by his operatic enterprises or discoveries, in his own day Caccini was equally great as a singer. He was a pupil of the celebrated Scipione della Palla, who is reputed to have been the author of a treatise on the Italian method or manner of vocal production at that period. This treatise was quoted by John Playford (1623-1686), the renowned Restoration publisher, theorist and composer, in the latter's celebrated work entitled "Introduction to the Skill of Music," first published in London in 1655. Playford states that della Palla's method of producing a trill was by beating or shaking with the fingers on the throat "in singing a plain song of six notes up and six down." Concerning this Mr. Franklin Taylor (1843-1919), the recently deceased English pianist, pedagog, editor, and didactic writer, says: "It seems clear that the original intention of a trill was to produce a trembling effect." In this case it would be more or less synonymous with the modern *tremolo*, and we shall not be much amiss in concluding that with this crude and immature form of trill Caccini must have been more or less familiar. It is also fairly probable that he both sang and wrote the grace he had first learned from his master della Palla. Almost equally certain it is that he handed on the invention or innovation to his daughter, Francesca, who was one of the most celebrated female singers of that time of musical renaissance. Still more certain it is that Caccini was one of the first to use the word *trillo* to indicate this ornament. In his "Nuove Musiche," published in Florence in 1601, he alludes to the *trillo* as indicating a pulsation or rapid repetition of a *single* sound sung upon a single vowel,—an effect which in modern musical parlance would be described as the "Vibrato." But an ornament closely resembling the modern trill Caccini describes under the name of *Gruppo*, a term which is used to-day to indicate "a turn-like group of four notes." This *Gruppo* or *Groppo* of Caccini is really what is described by later English theorists as a Beat, that is to say, a trill performed not by an alternation of the written note and the next degree above (or upper auxiliary), but by the alternation of a given note and that a semitone below.

The Trill an Evolution

But in common with all other inventions and improvements of an artistic character, the trill was more of an evolution than a creation. As a natural consequence of this there is more than one claimant for the credit of its introduction into musical theory and practice. Several historians are of opinion that the originator of the ornament was Emilio del Cavalieri, "a Roman gentleman of good family," who flourished from about 1550 to 1600. Cavalieri, as is well known, was a member of the so-called Florentine Academy, an association of Italian musicans and *litterati* who met regularly at the house of Count Bardi, at Florence, during the latter part of the 16th century. Their primary object was to restore the glories of the old Greek drama, or to produce new works along similar lines. In this direction, largely owing to the paucity of ancient records, their efforts were a decided failure; but they finally succeeded in establishing the homophonic form of musical composition,—the idea of an independent melody with a chordal accompaniment, —and thus prepared the way for the establishment of the recitative and the oratorio by Carissimi (1604-1674), and the opera by Monteverdi (1567-1643), in the earlier years of the century immediately following.

In this "goodly fellowship" of the Florentine Academy were found Peri and Caccini, already mentioned, also Rinuccini, the poet, the librettist of the early operas; Vincenzo Galileo, the father of the astronomer, and last, but not least, Cavalieri, who will be remembered as one of the reputed inventors of figured bass and the composer of the first oratorio—a kind of allegory set to music with stage scenery and action and known in musical history as "La Rappresentazione dell' Anima e del Corpo" (The Exhibition, or Representation, of the Mind and the Body), which was produced in 1600. One of his biographers says that Cavalieri was "among the earliest employers of vocal ornaments." But the same writer admits that the *trillo* used by Cavalieri instead of being a rapid oscillation between two tones or semitones was, in all probability, a certain vibratory production of the voice, probably considered an elegance in early times, but now more fitly estimated as a fault common among bad singers, and known as the tremolo.

The Florentine Masters

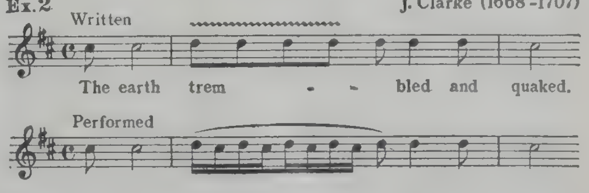
From the foregoing it is now fairly evident that to whomsoever, if to any particular personage, the so-called invention of the trill is to be attributed, the first men to systematically use it and to definitely describe it were the founders of the "musica nuova," the members of the world-famed Florentine Academy; also that it is to Italy, the land of song, that we are indebted for the origin of this most beautiful and important ornament, one of the very few of the ancient graces which have survived. At first essentially a vocal ornament, it was not long before its fame and practice spread to other lands. As might be expected, the trill, being a concomitant of the newly-developed opera, would accompany the introduction of that musical innovation into different countries. Accordingly we hear of its first use in France being placed to the credit of Robert Cambert (1628-1677), "the originator of French opera," to the performance or perpetration of which he was prompted by the Abbé Perrin, who, having heard Peri and Caccini's "Euridice" at Florence, in 1600, suggested to Cambert the composition of similar works, Perrin himself supplying the libretti. The subsequent success of these efforts is a matter of history, as is also the story of the fall of Cambert and of his coadjutor, owing to the intrigues of Jean Baptiste Lulli, the departure of Cambert to England, his entry into the service of Charles II as "Master of the King's Music," and his death in London in 1677. Perhaps Cambert did something to popularize the trill in England, but as a matter of fact it was already there in executive reality if not in actual name. For while it is true that no mention is made of the ornament in the works of Thomas Morley or any other writer of Elizabethan or Jacobean times, the early English virginal music, according to Henry Davey, abounded in ornaments many of which closely resembled the modern trill.

But the employment of this grace as a keyboard embellishment was largely due, in France, to Jacques Chambonières, Harpsichordist to Louis XIX, and the third of a race of distinguished keyboard executants and court organists. The use made of the trill by this celebrated artist is illustrated in his two volumes of harpsichord music published in Paris, in 1670. How the trill became popular in Germany is doubtful. It may have been conveyed from Italy by the composer of the first German opera and of the first Passion music, Heinrich Schütz (1585-1672), the pupil of that great Venetian, Giovanni Gabrieli. More probably, however, the credit is largely due to Georg Muffat (1645-1704), sometime organist of Strasburg Cathedral, a German musician of Scotch extraction, who studied for six years in Paris and there acquired some knowledge of the French graces of that period. But at any rate it is perfectly well proven that the trill as an embellishment of keyboard execution was well known to, and practiced by, the North German organists such as Reinken and Buxtehude—the men who preceded Bach and exercised so great an influence upon him.

The Trill in England

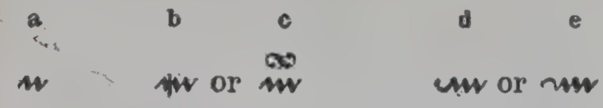
Turning our attention once more to England we note that more than a century after the publication of Playford's "Introduction," in 1769, to be exact, there appeared in London a work by one John Arnold (1715-1792)—"Philo Musicae," as he loved to call himself—entitled, "The Compleat Psalmodist or the Organist's, Parish Clerk's and Psalm Singer's Companion." To this work, which consisted of psalm tunes, anthems, and some crude settings of the Canticles, Arnold wrote a prefatory epitome of the rudiments of vocal music, in the course of which he says, speaking of ornaments, "The first and most principal Grace, necessary to be learned, is the Trill or Shake; that is, to move or shake your Voice distinctly on one Syllable the Distance of either a whole Tone or a Semitone, always beginning with the Note or half Note above." We quote this passage to show that England of that day, in common with her Continental neighbors, was commencing her trills upon the upper auxiliary rather than upon the principal note. Nearly half a century later, Dr. Thomas Busby (1755-1838), a pupil of Batishill, and a noted English theorist, compiled a Grammar of Music in which he describes an open trill as a trill having its upper auxiliary a whole tone above the principal note; A close trill, one with the upper auxiliary a semitone above; a turned trill as one ending with a turn in the modern manner; and he also speaks of the prolonged and the passing trills, all of which names deserve more respect and permanent use than they have ever received or are ever likely to receive in these giddy-paced times. Meanwhile, other English theorists —such as Dr. Callcott (1766-1821), the celebrated glee composer, in his "Musical Grammar" (1817)—were describing as a beat "the trill without the turn, and made generally at the distance of the Semitone below." Last of all we have Dr. W. A. Barrett (1834-1891), who, in his "Chorister's Guide," and now entirely out of print, says, "A beat is like the trill only the motions are less rapid, and the alternate note is below the note over which the sign ≐ is placed. It is rarely used in vocal music, and is sometimes thus indicated:—

Ex.2 J. Clarke (1668-1707)



With reference to the history of the interpretation of the trill it only remains for us to say that while, in pre-classical times, the trill usually commenced upon the upper auxiliary—unless for melodic reasons, or because it was preceded by another note on the next degree above—at the beginning of and immediately preceding the nineteenth century this method of execution was gradually changed. The nature of the innovation is best described in the words of Johann Nepomuk Hummel (1778-1837), perhaps the greatest pianist of his time, who, in his Pianoforte School, of 1827, laid down the rule that "in general every trill should begin with the note itself, over which it stands, and not with the subsidiary note above, unless the contrary be expressly indicated." Of course to this rule there were and are many exceptions which we cannot discuss here and now, as we are writing on the history of the trill rather than upon its mastery.

Concerning the sign for the trill, that too has varied during the centuries. Denoted at first by the *Trillo* and *Gruppo* or *Groppo*, of Caccini and Cavalieri, in the earlier harpsichord music its use or introduction was indicated by a cross (+) placed over or under the note to be ornamented. Later on it became known by a sign similar to that used for the double mordent, as in "a" below.



Then a hook from above or below indicated a trill preceded by a direct or inverted turn, see "d" and "e" above. A hook at the end denoted that the trill was to end with either a direct or an inverted turn in accordance with the turning of the hook up or down. Other indications of turned trills were as at "b" and "c" above. The use of the abbreviation *tr.*—of course an abbreviation of the Italian *trillo*—is at once logical and elegant, while the undulating line is an invaluable indication of the duration of the embellishment.

Such then, in brief, is the history of this most popular and useful ornament. Perhaps not so graceful as the turn, its employment in modern music is much more frequent, while its practice, says Mr. Ernest Fowles, in his "Studies in Musical Graces," is "in the highest degree beneficial, its complete command being often synonymous with high technical attainments." That this can be said of an ornament now more than three centuries old, speaks volumes for its vitality. What the future developments of the trill may be we cannot pretend to foretell.

Making Exercises Interesting

By Dr. Annie W. Patterson, B.A

AFTER the daily drill of the Scales—which, it is assumed, all serious instrumentalists realize as essential to the well-being of the fingers—the Exercise or Study needs special attention. Doubtless this mechanical side of the executive artist's preparation occupied a more prominent place in his customary round of practice some years ago than it does today. Now, the tendency is in the opposite direction. The idea is to "get there" as quickly as possible, and with the least possible exertion; so any of the preliminaries that can be cut out are lightheartedly omitted on the plea that only what is actually needful may occupy the student years. Be this as it may, and precious time, no doubt, is to be saved whenever feasible, yet that part of one's study which goes to perfect technic and to build up style must always deserve the musician's careful attention. No skimping of the details that lead to success are confessed by leading *virtuosi.* Invariably these bear witness to hard work and plenty of it, believing certainly that Genius is the faculty for taking infinite pains.

We do not, however, hear so much in these days of "speed at any cost" of the long series of Czerny and Clementi, and similar *etudes,* over which it was the fate of our parents and grandparents to toil and often weep. More modern nourishment for weak digitals and wrists have, it is certain, taken their place, and the "Hundred and One" and "Etude de la Velocity"—excellent in their way—are now considered old-fashioned by a great many "modern" professors. Yet there was much of interest and even beauty in these, for those who had ears to hear. Nowadays, nevertheless, it is more usual to base tests of skill on the "educational" piece of all kinds, whether this comes under the heading of classicality or ultramodernism. There is much to be said in favor of this procedure. The question really is: How correctly and effectively do we make use of these means to an end? It is not enough to play through even to the point of note or time perfection. The inner meaning of the required drill should be made clear to the pupil. Thus, if a particular item can be used to illustrate such points as finger staccato, "loose" wrist, or the correct manipulation of chords, either as a whole or in arpeggio, these matters should be pointed out and lucidly explained by the teacher during the lesson. Some preceptors have a happy knack in choosing just those selections for a student's practice that will strengthen some individual weakness, such as "dirty" or "sloppy" playing, weak attack, deficiencies in tone and time senses, and so forth. Such a tutor is well worth the fee he may charge. He has the psychological as well as the pedagogic instinct, which is so useful to the budding mind, no matter what be the nature of the task which is set before it.

We might easily quote many examples of "pieces" which lend themselves to "exercise" work, and this—from the fact that they may also serve as means of future display—should be full of interest to ambitious scholars. The Classics, however, furnish abundant instances of these, and one has only to think of J. S. Bach's clavier work, the various movements of the sonatas of Beethoven, the tone-pictures of Schumann, and even the much neglected shorter pieces of Schubert and Mendelssohn, to have an extensive educational program ready made. Chopin, Liszt, Grieg and the moderns—to the last degree of Modernity or Sonority—may supplement the list at discretion. If, from such a plethora of riches, one takes any selection, a good working advice is that—for "study" purposes—the two hands should always be taken separately. The advantage of this is two-fold. It helps in developing the particular phase of technic required, and it also immensely adds to the ultimate clear grasp, and wholly familiar acquaintance which the tyro will have with the work in question. It is, in short, the perfecting of the whole by the completion of its component parts.

Legato—Plus Ears

By Ruth L. Barnett

IF THERE is one defect more glaring than any other in the playing of pianoforte students it is their indifferent performance of legato passages. Too many rest upon the supposition that whatever is not consciously made staccato is legato, and the teacher's admonition to play more smoothly or to connect the notes is of no avail since most pupils are not absolutely sure whether they are playing legato or not.

It is a point that should be emphasized during the very first lessons. Many teachers feel that correct notes, time and fingering are all they can demand from a beginner. No child old enough to sit at the piano for a music lesson is unable to grasp the meaning of legato and to detect a break in the smoothness of a simple phrase, after ten minutes of careful listening. And right here begins the cultivation of the musician's most helpful habit, that of listening to his own playing.

It is possible to secure a perfect legato by the mechanical process of releasing one key exactly as another is put down; but fingers, however well trained, are faulty at times; and, unless the ear is taught to warn them, their faults may become very noticeable. The more one is concerned with watching finger motions, the less will he listen to the sounds he is producing.

Get at the root of the trouble. Send your pupil away from the piano. Explain to him that by legato playing is meant that each note must sing without ceasing until another is sounded; yet the tones must not overlap, but fit together exactly. Then play a few notes very slowly, with one noticeable break in the smoothness See if your pupil can detect the flaw. Try several times until he can tell instantly when your playing is not perfectly legato. When he can do this an occasional suggestion from you will be sufficient.

Looking Ahead to ETUDE Features

The Etude looks forward with genuine pleasure to a number of features which we know are sure to delight our readers by giving the kind of information and instruction which may prove priceless to them in their life work. Among these will be a series of analytical printed lessons by famous pianists including Katharine Goodson and others. These lessons have proved invaluable to thousands in enabling them to play great masterpieces more artistically. Similar "lessons" have been sold individually in various editions at rates far above the subscription price for The Etude for a year. Another notable feature of our coming season will be a series of very practical and interesting articles by the great pianist Mark Hambourg. In the October issue of The Etude there will be an excellent conference with Mme. Marcella Sembrich, revealing some most interesting educational points in Voice Culture. Albert Spalding, most famous of American violinists, has just completed a fine article upon violin transcriptions which will be published shortly.

Is the Triangle a Musical Instrument?

By Francesco Berger

Is the triangle a musical instrument? The correct answer to this question is a serious matter.

If the triangle is a musical instrument, it has as much right to a place in our orchestra as the flute, the violin, or the trumpet; and its inclusion in their scores by many distinguished composers proves that they have thought it worthy of such distinction. On the other hand, if it is not a musical instrument, it must have crept in under false pretences, and in spite of those composers, out it should henceforth go,—out into the limbo of forgotten things, with a few symphonies, a concerto or two, and not a little pianoforte music that you and I wot of.

The question hinges upon what constitutes a musical instrument, and what is merely a sound emitting article. Probably the difference between Sound and Music could be explained by scientists as depending upon "vibrations," and other learned expressions. But we are not here seeking for scientific information—we are simply concerned with every-day definitions.

Distant Church Bells

Poets and novelists with vivid imaginations often rave about "the music" of distant church bells. I maintain that if these bells emit only *one* sound, there is precious little "music" in them. What these romantic people detect as musical can only be caused by *variety*. Two bells producing *one* identical sound do *not* produce music; though two bells, producing sounds that differ from one another, will produce a *first step* towards it.

The first step (though a crude one) towards Music is created when any *one* sound we add some *other*. The human ear then travels from sound of a certain pitch to sound of a different one, realizes the distance, small or great, that separates the two, and recognizes a first step in music. Mere repetition of the *same* sound, even with the addition of varied rhythms, will not yield "Music." Anyone living within ear-shot of a bell, whether of church, or school, or factory, will endorse this from his own painful experience. It is the absence of *diversity* of sound which debars jangling glasses, rumbling wheels, clanging bells, or howling babies from being admitted as "musical."

According to this theory, the triangle being incapable of producing more than *one* sound, cannot be considered a musical instrument. But if you happen to have a brother or friend who plays it in an orchestra, pray do not tell him I say so, for he might not be pleased. Under reversed conditions I don't think I should be.

In the scores of some of our best composers we occasionally find excellent use made of the triangle's peculiar tone-quality. A sudden transition, say in an Overture, from heavy to light music, from *fortissimo* to *pianissimo,* from *pesante* to *leggiero* affords the judicious master of instrumentation a fitting opportunity for its introduction, and it must be addmitted that a sprinkle of it in an entire movement gives the same piquancy that ginger gives to a pudding, or the shallot gives to a stewed steak. Something, therefore, must be conceded in its favor.

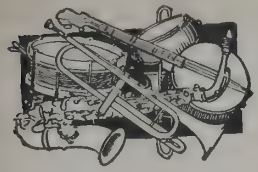
Triangoloni

As the modern composer is no longer satisfied with the pair of timpani that sufficed for his predecessors, but demands three or even four, so some futurist in the next generation may require three or four triangles, and will, of course, want them of different pitch. This will have to be met by making triangles of different sizes, and will introduce us to *triangolinas* and *triangoloni.* And we shall have to admit the justice of his demand. For he will point to the three oboi here, and the three clarinets there, and the tuba everywhere, and will cry, "If they, why not I?" The millennium of the triangle will have arrived. After all, in comparison with other items of "kitchen furniture" which the concert-goer of today has to submit to, it is but a harmless thing.

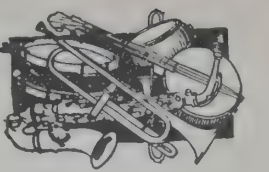
Not long ago I purchased, at a second-hand bookstall in the city, a book on instrumentation. It was handsomely bound, and was in excellent state of preservation, except that its title-page was missing, so that I have no clue to its author or publisher. It certainly is not Berlioz, nor Marx, nor Prout. Oddly enough, the only pages that had been well thumbed by its original owner were those devoted to the triangle. And its paragraphs contained the following lines, which I consider sufficiently amusing to be transcribed here:

Tinkle soft, TrianguLAAR,
Mark the rhythm, bar by bar;
Like the ray from distant star
Send out thy tintinnabular jar.

From *The Monthly Musical Record* (London.)



What is Jazz Doing to American Music?



A Conference Secured Expressly for THE ETUDE with The Millionaire Emperor of Super-Jazz

PAUL WHITEMAN

[EDITOR'S NOTE: *Paul Whiteman was born in Denver, Colorado, where his father, Wilberforce James Whiteman, has been the superintendent of music of the Public Schools for over half a century. The elder Whiteman is said to have inaugurated the first orchestra of size in any American public school. He also conducted several amateur orchestras and employed orchestras in large choral concerts which he presented. His son was thus brought up in an atmosphere of music. Because viola players were hard to find, he started playing viola in one of his father's orchestras. He then joined the Denver Symphony Orchestra, conducted by Rafael Cavallo. He continued his musical education under a pupil of Henry Schradieck, and also with Max Bendix. For a time he played with the Russian Symphony Orchestra, and at the time of the San Francisco Fair joined the San Francisco Symphony Orchestra. He also played with the Minetti String Quartet.*]

"THERE seems to come a time in the career of every man who does any thinking whatever about his future when he realizes that he must do something very radical or he will never advance one inch beyond his present position. He must pull up his tent posts and move on to other and newer fields in order to succeed. That was the condition in which I found myself in San Francisco in the year 1915. I realized that I had worked and studied very hard all my life. I realized that I had played in large symphony orchestras for years; that I knew the classical literature of the orchestra from the viola desk; that I was working from morn to night in the orchestra, in the quartet and also in a hotel orchestra, and that all I was getting for this experience and this hard labor was $125 a week. There was no future ahead and I was ambitious.

"Just then jazz was commencing to draw the attention of the American people. At that time jazz was so outrageous that most musicians were nauseated at the very thought. Jazz meant then any group of nondescript instruments, aided and abetted by a strong-armed drummer who was a veritable percussion virtuoso on all of the implements of the kitchen. He was also supposed to be a humorist and demonstrated his humor by juggling with his drum sticks. The leader, whether he played the violin or the saxophone, often introduced a lot of clowning that never failed to entertain the audience.

New Characteristic Instruments

"Yet here was something that was breaking down certain conventions long considered sacred in that outrageous dance combination of piano, violin and cornet. Here came the banjo with its distinctive character; here came the muted wind instruments, and, more than this, extremely clever performers upon these instruments who could produce new and striking effects. Enter the saxophone family. The saxophone was invented in Paris by Adolphe Sax (himself an exceptionally fine flutist and clarinetist). At first Sax set out to improve the clarinet; but in 1842 he invented the conical-bore, metal wind instrument with one reed, which bears his name. He went from his native Belgium to Paris to show the instrument with its new and distinctive tone, to Berlioz. Berlioz, with his ear for tonal color, went into raptures over it. His instruments were adopted in French bands and in some bands in other countries. Sousa uses them in large quantity in his remarkable organization. The saxophone has also been demanded at times by composers for the symphony orchestra. It was not, however, until the introduction of the jazz band that this instrument with its peculiar mellow, appealing character, as well as its humorous possibilities, came into its own. Now it is the *Caruso of the Jazz Orchestra*.

At no other time and in no other country could such an amazing career have been inaugurated as that of Paul Whiteman and his famous orchestras. Because he has brought a new meaning to American Jazz, because his work in its field has commanded the interested attention of serious musicians here and abroad, and because he himself is a trained musician with years of routine work in large symphony orchestras to his credit, THE ETUDE has selected him to be the exponent of "super-jazz" in this issue.

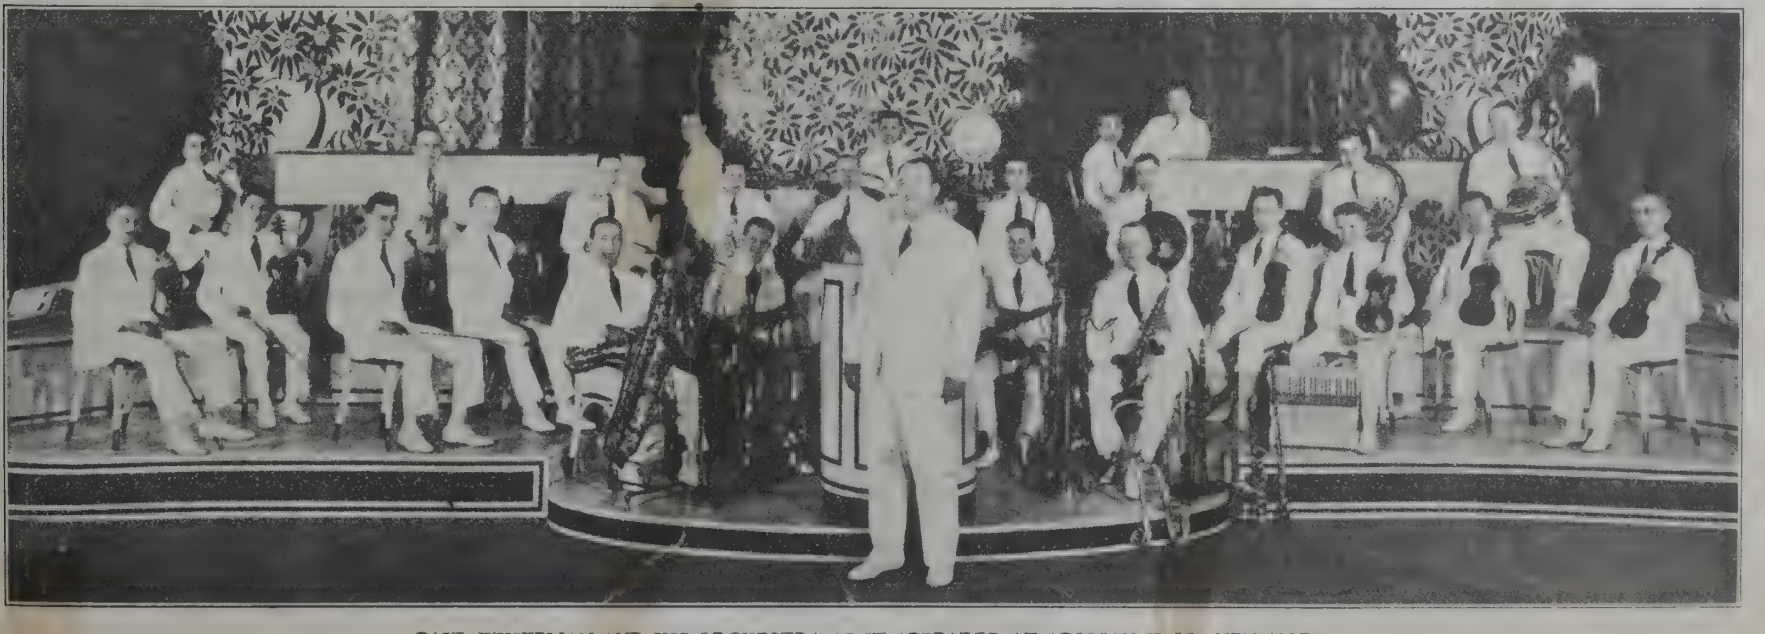
Definite Scores

"The possibilities of the musical combinations of these instruments intrigued me. At that time literally everybody who played in a jazz band 'faked' or 'vamped,' or, in the best English, improvised. There was nothing intelligently and beautifully scored for these unique groups. I realized the immense possibilities of the thing, and was the first to arrange for definite accurate scores of popular themes done with the same detailed care with which the symphony instrumentation is prepared. Many of my early scores were written by Ferdy Graffe, who had a genius for characterizing the instruments and filling in intermediate parts so that there would be no thinness. More than this, the compositions could be played every time with the same effect, which was impossible in the old-fashioned jazz band in which each player felt it his duty literally to compose the piece with each performance.

"At first I realized that the jazz orchestra required most of all an insistent background of rhythm. For this I employed the banjo, using it largely as a percussion rather than a melodic instrument. Then I realized that there was a great deal of horrible blare and noise about the old-fashioned jazz orchestra that was wholly unnecessary and would soon disappear before more musical effects. Musical effects do not come from poorly trained or unmusical players. In order to get the best results I must get the best players. Naturally, the best come to the top and demand more money. It is, like in everything else, a matter of supply and demand. Really very fine jazz players are quite rare. The leading player in my best orchestra will earn about $600 a week through the year. Most of the other players in the leading orchestra will average $300 a week. But this is an exceptional orchestra at the Palais Royal, and has played on both sides of the Atlantic with great success. The men are picked for their personalities, their musicianship and their versatility. They must make a good appearance at all times. The leading player in my Palais Royal orchestra plays fourteen different instruments, and often uses all of them in one program. At present there are over four hundred men employed in the fifty-two Paul Whiteman Orchestras located all over the United States and in Paris, London, Havana and Mexico. All these orchestras receive careful supervision and training, and play according to specific directions which I have personally prepared.

Sousa's Definition

"I am often asked, 'What is jazz?' I know of no better definition than that given by Lieut. Comm. John Philip Sousa, U. S. N. R. F. He derives the word from 'Jazzbo,' the term used in the old-fashioned minstrel show when the performers 'cut loose' and improvised upon or 'Jazzboed' the tune. The trombone guffawed, the cornet shrieked and the clarinet wailed to the banging of the drums. The effect was a breakdown of the worst kind. From this wild din, however, has come the jazz which is commanding the attention of serious musicians everywhere. When I was in Paris with my orchestra this year I met many distinguished musicians who came with eager curiosity to hear some of the new tonal combinations. I found that they were only mildly interested in the magnificent works of such American composers as MacDowell, Carpenter, Chadwick, Cadman and others. 'We know all that,' they said, 'but jazz is a new note—something different, some-



PAUL WHITEMAN AND HIS ORCHESTRA AS IT APPEARED AT AEOLIAN HALL, NEW YORK thing peculiarly American, like the Sousa March. We want to know about jazz.' Here was the recognition of this new American note that I had identified in the old-fashioned jazz of a decade ago. This encouraged me to give a concert in Aeolian Hall with my leading orchestra—several members of which, by the way, have played in leading symphony orchestras. The concert was attended by foremost musicians, such as Damrosch, Wagner, Rachmaninoff, Mengelberg, and others who have been most enthusiastic over the possibilities of this new tonal combination. This was a combination of twenty-two men, thus:

8 First Violins
3 Saxophones
2 Trumpets
2 Trombones
2 Horns
2 Pianos
Drums
Banjos.

Note, however, how such a combination might work with the kind of players I employ at the Palais Royal. Could such a versatile group, capable of changing the instrumental registrations at instant notice, be found elsewhere in the world? Here are the names of the players, with the number of instruments they may employ in our regular programs.

Gorman: E-flat saxophone, B-flat saxophone, E-flat alto saxophone, oboe, hecklophone, B-flat clarinet, E-flat clarinet, alto clarinet, bass clarinet, octavin.

Strickaden: B-flat soprano saxophone, E-flat alto saxophone, B-flat tenor saxophone, E-flat baritone saxophone, oboe, clarinet.

Byers: Flute, B-flat soprano saxophone, B-flat tenor saxophone, C soprano saxophone, E-flat baritone.

Busse: Trumpet, flügelhorn.

Seigrist: Trumpet, flügelhorn.

Maxom: Trombone, euphonium, trumpet.

Cassidy: Bass trombone, euphonium.

Arnen: Tuba, string bass.

Lang: Piano, harp, celeste.

Puigatue: Banjo, drums and kindred instruments.

The Violin as Obligato

"To this group I add the violin which is employed as an obligato instrument most of the time and not as a solo instrument. Thus, you see, twelve men have a range of forty instruments, and have opportunities for variety in tone color, prescribed by our scorings, which is, to say the least, unusual. Some of the phonograph records of this group have been sold by the million, and have been heard around the world. This orchestra was the first of its type to tour as a 'straight' orchestra, that is, without clowning or absurd action upon the part of the members. It was the first to be employed in a big Broadway musical show in a special scene set for it. It was the first to give a jazz concert in a foremost concert hall.

"Often I am asked the secret of my success in this field. One secret is that I do not attempt to go out of the field. I know that it is something distinct. I do not attempt to compete with the symphony orchestra; and no one knows our limitations better that I. Whether we are playing the simple, suave theme of a pathetic Negro 'blues,' or the sharp, saucy, pepful rhythm of the jazz tune, we strive to make the effect as thoroughly musical as possible; but we never forget that we are distinctly a jazz orchestra with a new and delightful message to restless America—the America still imbued with the pioneer spirit and never content to be permanently satisfied with the conventions handed to it by Europe. We can not expect the man in the street, with a *Police Gazette* in his hands, to pay a large price to see Ibsen's 'Ghosts.' He must be educated up to 'Ghosts.' He will be fascinated by jazz, and use it as a suspension bridge to better things. I have seen this happen a score of times. It is musical education in its practical form.

Leading Composers Influenced

"That the leading composers of the world will be influenced by jazz goes without saying. One might assert that they have already been influenced, if some of the recent scores of Strauss, Grainger and Carpenter are examined. American jazz has circumvented the globe. Teachers of piano may not realize that the American child craves these exhilarating rhythms, and that they may be written by able composers so that there is no taint of cheap or vulgar music about them. When I played the famous jazz arrangement of Rimsky-Korsakoff's 'Song of India,' I was maligned by many for lowering a great masterpiece. I have rather a sneaking idea that Rimsky-Korsakoff himself would have been delighted with some of the tonal effects, and that he would have been amazed to find the whole American public whistling a tune that he could hardly have intended for more than a comparatively few grand opera devotees. The theft of tunes without credit to the composer is unpardonable; but if jazz will put a great masterpiece into currency, all honor to jazz."

Strike Once, Not Twice

By E. F. Marks

Concentration, concentration. How our eyes weary at the sight of the word, and our ears revolt at the sound of it, we see and hear it so often. Yet how essentially necessary it becomes to thoroughly understand and possess it; especially when a gross lack of it is encountered among the best of pupils. Is this inability to focus one's mind or undivided attention on a single item of a subject the result of dilatory teaching, or is it hereditary? Some of the brightest children at the day school will exhibit non-concentration in music lessons—not once or twice, but for months; and it is only by the most careful and persevering endeavors of the teacher that the child's mind can be brought to the right attitude on the subject.

In such a simple exercise as the scale, some pupils persist in striking a key twice, notwithstanding the fact that it was struck correctly at the first attempt. Now this fault—repeating a tone when called for only once—in many cases is not due to nervousness (an inherited defect) but obviously to a lack of concentration on the one key in question. The pupil allows his mind to wander helter-skelter; the fingers are not controlled by it, but move mechanically without thought; hence they repeat the last movement automatically without the control of a well-regulated mind.

PAUL WHITEMAN

A pupil of good standing in her daily classes possessed this error of key-repetition. Notwithstanding many admonitions to be careful to strike the key but once, she still clung to the fault tenaciously. Finally we decided to try slowness and accuracy of touch. The pupil was required to practice at home in the following manner: To strike the keynote of the scale; to count four slowly; while doing so, to prepare the next finger for the second tone by lifting the finger high above the second key. Strike this key, at the same time releasing the first one; count four slowly, making preparation of the next finger to take the next key. Proceed in this slow manner; striking, counting with immediate preparation for the next key, throughout the entire scale exercise.

After a few lessons with the scale practiced in this way, the counting was reduced to three counts to each tone; later to two, and finally to one. The fault was conquered through this method of procedure, and the pupil was so elated with the spontaneity of the thought control that we were forced to restrain her speed. Besides, through this slow practice her legato touch improved.

Lincoln Sets Students An Example

W. F. Gates

"How is your music coming on?" we asked a promising student, lately.

"Oh, I am discouraged. I guess I will have to give it up. I don't seem to make the progress I ought to."

"What is the trouble?"

"Well, I work just as hard as Madge does, but people do not seem to like my play as much. She gets a number of engagements but I get none. It all seems useless."

There are times when we all see things through dark blue spectacles. There are times when fate seems to be quite against us. There are times when everything goes wrong. But these are just the times when we are to show whether we deserve to succeed or not. It is not how happy we are when successful that counts—it is how energetic and resourceful we are when things fail.

Take an example out of American history. We know that Abraham Lincoln was one of the greatest of American presidents. We know his tenacity to right when he was in office. We know his affectional hold on the American people—in fact on the whole civilized world—but do we know that back of this towering personality was a series of failures, none of which dimmed his energy or his enthusiasm for what he deemed right?

Look at this list: Abraham Lincoln a young man, ran for the Legislature in Illinois, and was badly defeated.

Next he entered business, failed, and spent many years of his life squaring up the debts contracted by his partner.

He loved a beautiful young woman, became engaged to her—then she died.

He then ran for Congress, and was badly beaten.

He tried for an appointment to the U. S. Land Office, but failed.

Later, he became a candidate for U. S. Senate, and was badly swamped.

In 1856, he ran as a candidate for Vice-President, and again met defeat.

In 1858, as a candidate, he was defeated by Douglas:

"But I am not a Lincoln," comes the answer.

True, you are not—not even a musical Lincoln. But just inasmuch as you have the Lincolnian perseverance, good sense and love for the right, just in that proportion will you succeed.

Things to Teach My Pupils Every Day

By W. L. Clark

1. That adequate practice is a great essential to musical accomplishment.
2. That accurate, intelligent playing is far superior to slovenly execution of material.
3. That there must be expression as well as note reading and key manipulation.
4. That a splendid musical inheritance, or ease of learning, does not accomplish anything unless considerable effort is applied to the assignments.
5. That each one should have a standard of playing as a definite aim—that standard to be the best within the individual's ability.
6. That the musical profession offers rewards to those who have the ability to compose, as well as to great players.
7. That the enjoyment that comes from a knowledge of music is greater than the effort required to attain that knowledge.
8. That music is not a separate and distinct art; it is rather an outgrowth of many conditions of many centuries.
9. That musical ability is given to the poor, as well as to the rich, and to the rich as well as to the poor.
10. That a great many people have a greater musical ability than they themselves realize, because they have never taken the effort to develop their talent.

"All that a composer has to do is to feel and to convey his sensations in music. It is not for him to theorize nor to speculate on the function of life. He has only to live. Art is subject to the same laws as life. Life is effort, movement, progress. For the mind as for the body, to cease struggling is to begin to die."

—Edgar Varèse.

Drillmaster—or Music Teacher?

By CONSTANTIN VON STERNBERG

This article was written by Mr. Von Sternberg just before his death

JOSEF HOFMANN said once: "A pianist without technic is like a pleasure traveler without money." The indisspensableness of technic could scarcely be better illustrated; and yet, have we not met pleasure travelers that had money galore, but no appreciation of what they saw? Travelers that sought pleasure without finding it; for all churches, all galleries, all landscapes looked alike to them, because the esthetic side of their lives was undeveloped, dormant, blunt. And by the same token, have we not heard enough pianists that had technic galore and were utterly devoid of spirituality; who boiled their Bach, their Beethoven and their Chopin all in the same pot and made them sound all alike?

On the other hand, have we not had glorious, world-renowned pianists whose technic was by no means always infallible and whose playing has nevertheless enchanted their audiences and roused their enthusiasm to the highest degree? We need, in this connection, but to think of Rubenstein who had, of course, a wonderful technic; but whenever a higher purpose demanded it, he threw his technic to the winds and rose above and beyond it.

Americans Love Technic

Now, as a matter of fact, which should be frankly recognized, as facts always should, we are in America much given to admiring technic for its own sake. It may have something to do with our love of sport, of bulk, of size, of rapidity, of anything supernormal, whether there is a reason or not for it to be so. Our climate may have something to do with this tendency. This might in a measure explain and extenuate it, but it would not alter the *fact*.

Yet, when in spite of this lamentable fact we observe how earnest, how sincere, are the efforts of musically influential people to transmute this predilection for mere keyboard acrobatics into a love of music; when we reflect that, after all, we have some pianists who conceal their technic so well under higher attributes that it never attracts special notice; and when we, then, remember that these very pianists are the ones, who are regarded as the greatest by the critics, by the substantial public and by the box offices; then it seems indeed timely to bring *this* fact to the attention of a certain class of piano teachers and particularly to the "rudimentary" teachers and the "technic specialists."

Our Debt to Rudimentary Teachers

Personally, I owe a great deal of gratitude to rudimentary and technic teachers; for they certainly have saved me much drudgery, much unlovable labor, much poorly disguised yawning, and not for anything in the world would I belittle their estimable work. However, I can not fail to recognize that on the other hand they have frequently made it extremely difficult for me to make their pupils, when they sent them to me, recognize and understand that their fingers were altogether too far ahead of their musical minds and ears—so far ahead, indeed, as to demand a return to pieces which made but very moderate claims, if any, upon their needlessly superabundant technic—to make them grasp the idea that music-making is done for "listeners," not for "spectators."

The faults of many rudimentary teachers, faults, to which all my sincere admiration of their merits cannot blind me, are twofold: *overreaching themselves and teaching the obvious.*

Blinded Pupils

By "overreaching" I mean the deplorable habit of many technic teachers of allowing their pupils to play pieces for which they are mentally altogether unequipped. That the ability to execute the difficult passages in a piece does not constitute an artistic (nor even a merely intelligible) interpretation of it, is a fact to which many of the teachers I have in mind are either blind or they blind their pupils to it. Their own blindness may not be pretended and the deceiving of their pupils may be done unconsciously (not in spite of knowing better); they may act in perfectly good faith, but in either case the mischief is caused by the regrettable circumstance that, by nature or education or both, these teachers are wanting in musical feeling and knowledge. To boot, they often let their pupils play pieces which the teachers, themselves, could not master with any amount of practicing, not even technically.

The Teachers' Course

Some of these teachers have gone through a so-called "teachers' course" in which they learned the *mechanical* principles of piano playing and they instill into their pupils' minds these very excellent principles—but nothing else. Not a word on the matter of melodic curves, of rhythmic charm, of dynamics, form, character and characteristics of the pieces, of suspensions and their resolutions, of pivotal notes in modulations, in short, of anything beyond the mere notes—and these not always right, especially in the case of an occasional misprint, which, alas, they have no means to recognize as such. And as to the pedal—that poor abused Cinderella—it acts like a coalbin to a freshly washed white poodle-dog. It seems to be strongly prejudiced against clean harmonies. It makes of all chords a Bedlam that makes everything sound like Stravinsky. Even Kuhlau Sonatinas!

Still, sometimes these teachers have a lurking suspicion that there may be something lacking in the playing of this or that pupil. In such cases they send that pupil to a so-called "interpretation teacher," to engage one or two lessons "to get some points." That interpretation teacher has his job cut out for him! He is supposed to supply a soul for an artificially made skeleton, in one or two half-hour lessons, and these a whole week apart!

Teaching the Obvious

The want of musical training is also the cause of the other fault I mentioned—the "teaching of the obvious." It stands to reason that the pieces used in the first and second grades cannot contain sublime thoughts and complex devices in counterpoint, rhythm and harmonization; but in the *third grade* a beginning ought surely to be made to stir up the pupil's *thinking,* instead of allowing him to dwell always upon commonplaces which scarcely require anything from the teacher but the correcting of occasional false notes, in self-protection. This stimulating of the pupils' minds is very seldom done by technic teachers. They prefer the use of pieces for which the pupils should really need no teacher at all if they had been accustomed to a little thinking. But the technic teachers still use Kuhlau or Clementi Sonatinas (or their equally inane equivalents by more recent writers), because a better type of music would oblige the teacher to do a good deal of explaining with every piece of actual "teaching." For this they are either too comfortable or perhaps too unequipped in their own knowledge (or rather the lack of it); and thus they keep on letting their pupils use their fingers while their brains remain inactive and their ears grow more and more callous, unsusceptible to the most horrifying discords and mixtures of tones.

Surely, this ought not to be! We had in the past, and we have in the present, a perfect treasure trove of highly meritorious third-grade pieces that are technically quite within the average pupil's range; but they are not used because they require for their proper rendition a little more than the mere notes; for they are apt to sound queer or even ugly if they are played without a "musical" understanding.

The Self-Supporting Student

Let me, by way of a brief digression, recognize that circumstances sometimes compel a girl or boy to earn money for a living and, therefore, to begin teaching as soon as possible. But circumstances that would compel anyone to *concentrate* upon money-getting alone and *at the expense of his own further development;* such circumstances *do not exist,* except in extremely rare and abnormal cases. I maintain, therefore, that hand in hand with their *teaching* they ought to keep on *learning;* they should take "music" lessons from a recognized "musician"; and if they should have no time to practice difficult pieces they should, with the aid of their teacher, go over those pieces which they intend to assign to their pupils and ask their own teacher for instruction on the strictly musical, non-technical matters in them.

This would cure not only the two evils already referred to, but it would at the same time go far toward preventing what is known as "epidemical compositions," pieces which everybody plays and which all pupils play—and play equally bad.

Having spoken of compositions written by masters of the past, let me briefly refer to the great lover of children, Robert Schumann, whose wonderful opus 68 is scarcely known to the average young pupil. The first five pieces of it may belong to the second grade. Numbers 13, 15, 17, 27, 28, 32, 33, 34 and 41 may be reserved for the fourth and fifth grade, but this still leaves *twenty-six* perfect gems which a pupil of the third grade can very well master, provided his mind and ears are opened to their melodic, harmonic and constructive beauties and his imagination is awakened. There are also Nos. 4, 5, 6, 17 and some others in the same master's opus 124, equally unknown to young students. I referred to Schumann merely to cite an example of the past.

Good American Compositions

Of more recent writers, like Dallier and other American composers who wrote for young people, it is no longer open to dispute that a great deal of excellent music for the third grade is written in this country. Of course, the inane kind is, unfortunately, also as well represented as it is in other lands; it is supplied by those who have learned to "make" melodies instead of taking them out of the heart and imagination. Selective action will be necessary there; but the output, ready for selection, is really very large and contains far too many things of sterling merit to be neglected.

But how is the rudimentary teacher to make a proper selection if he is *not* a good musician, as so few of them are—unfortunately? This brings me back to the starting point: those who teach the rudiments of music must not be what Oliver Wendell Holmes called "one-story people," but they should be able to encompass the *musical* contents of such pieces as they assign to their pupils and as they may not have time and technic enough to play themselves.

Slogans or Catchwords

Of the slogans and catchwords that are in more or less general use there is one which seems to have been coined for especial use in musical matters: "Everybody is doing it." It really does not apply to music with an alarming degree of exactness, insofar as ninety-nine per cent. of all music making in our country is, so far, purely imitative. People play only what someone else has played; what they have heard; not what they have found out for themselves on the staffed paper; and if their model happened to be bad, as it usually is under such conditions, what can the copy of it be?

Now, shall it remain so? Shall the sacred mission of music, which cannot be served by imitation any more than gentility by sham jewelry, shall it be relegated to a meaningless ear tickle, to a mere sportive display of digital dexterousness, without any appeal to our higher qualities? If not, if we are to become a musically cultured nation, it will not be achieved by turning the responsive confidant of all the greatest masters in music—the keyboard—into a racing ground; nor will the hothouse methods—now all too frequently employed, and often for ulterior purposes—succeed in it. We must begin with those whom the Nazarene Teacher invited; we must begin with the children; and, to prepare for this, we must begin with the rudimentary teachers by demanding that they be musicians and not mere finger drillmasters.

* *

Self-Test Questions on Mr. Sternberg's Article

(1) Has infallible technic produced the greatest of pianists?

(2) What are the most valuable services the rudimentary teacher may render?

(3) How can we best stimulate the pupil's mind?

Give Your Favorite Exercise a Rest

By Rena I. Carver

THIS suggestion may be of special service to the advanced student working alone or the teacher striving to keep up her own practice.

Having but few moments to devote to planning your study, you will naturally turn to those old standbys that have proved their worth. Change your schedule three or four times a year. If the time comes when the thought of practice is burdensome, rest a few days to get back your zest for exercises. Sleep all you can and search your musical magazines for new ways of attaining your goal. Avoid staleness!

Sparks From the Musical Anvil

Comments of Contemporary Music Lovers

"The young singer must practice to inhale a great amount of breath quickly and then to release it steadily in a sustained pin-point of air."—Joseph Schwartz.

* * *

"The Anglo-Saxon is popular in most parts of Europe at present; and, as this is a matter of natural liking rather than of racial propaganda, the bias on the part of the public manifests itself strongly in such an instinctive thing as the art of music."—Percy Grainger.

"The average American views a concert much as he does a baseball game or the movies. It is a stimulus for his tired senses, with the 'high note' as the home run or climax."

—Emilio de Gogorza.

"Indian music may be the basic American music, except from an historic point of view; but it is undeniably fascinating folk music."

—Alberto Bimboni.

"There is no money in piano sonatas or chamber works. One composes them because he loves to do it; one feels within the urge to create. Hurt as it may not to have a beautiful work of art really appreciated, the true musician and artist always writes music as he feels it and in the forms that best express his ideas."

—Charles Wakefield Cadman.

A Musical Nation

By Sidné Taiz

Just when a nation achieves the happy state where it may be said to be among the elect that are called "musical" is perhaps not capable of a quite definite decision. Perhaps it is a matter of music becoming a part of the people's daily life rather than that the country shall produce either great composers or eminent interpreters.

With this latter proposition in mind, has America reached the time when she may be credited among the "Musical Nations?" What country is engaged in more musical activity? Musical clubs, community choruses, bands and orchestras, thrive in city and hamlet, even out in the rural community.

Other countries have produced and are giving the world more composers, more originality in composition; but are they doing more to keep the spirit of music alive among the people? Have we not become a nation of "music absorbers?" We are furnishing audiences—appreciative audiences—to the musical interpreters of the world. Does not this signify a "Musical America?"

Children as Imitators

By S. M. C.

It is a strange fact that there is often a striking resemblance between the handwriting of a class of school children and that of their teacher. This handwriting, moreover, changes from year to year, and becomes good, bad, or indifferent, as the children progress from grade to grade and imitate the models set before them. A teacher who habitually uses flourishes or indulges in queer and unusual letter formations will soon find his pupil doing the same.

In view of this fact, experienced teachers strive to keep near the "copy-book" model whenever writing on the board or exhibiting their penmanship in any other way.

The music teacher may well take a lesson from this when playing for his pupils. He may be skilled in the use of rubato, or indulge in other peculiarities of rhythm, technic or expression; but these should be barred when playing for young children who are not yet well grounded in rhythm and are, as a rule, only too eager to do as teacher does.

When playing a child's piece let it be in a reasonable tempo and simple manner, such as it can readily grasp and follow. A dazzling exhibition of superior skill, which the child can in his present stage of progress by no means imitate, will only cause him to reproduce a crude, distorted and unrecognizable conglomeration of sounds.

"Since the personality of a performer seems obviously to stand in the way of the composer's message, a course in the timely suppression of too much ego might profitably be added to the curriculum of a conscientious conservatory of music."—Carlos Salzedo.

American Dance Music Is Not Jazz

By Isham Jones

Where Popular Songs Come From

Jazz music. What is jazz? What is there in favor of jazz music? Those questions have been asked many times, and I am appreciative of the opportunity to express through The Etude a few of my own thoughts regarding this interesting topic.

What is jazz? Considering that all popular music is more or less termed jazz, I would briefly describe it as modern emotional music. It is expressive of the happy dance; it is rhythm that is simple and yet inspiring. It is music that is irresistible to the feet and at the same time appealing to the heart and head. It has been said that all music, whether classical or popular, must appeal to one or more of those parts of the body. I believe, judging from the popularity of certain numbers, that most of the popular songs of to-day appeal to all three.

Read the lyrics—the chorus of a popular song. You will note that an appeal has been made to the heart through the sentiment expressed. You will also note the appeal to the head, because each word easily inserts itself into the mind. Now this same lyric, set to music especially composed for it and then played in a dance tempo, immediately appeals to the feet. Therefore, it can be readily appreciated, composers of popular music are always striving to make an appeal to each of those factors.

ISHAM JONES
Noted Conductor of American Dance Music Orchestras

It is now quite generally admitted that practically every popular hit of the day is based upon some music of the past, some work of a famous composer, or, in many instances, old folk-songs. This is not always deliberate, but, instead, is often quite accidental. I have known of some popular songs with parts of the melody almost identical with certain parts of an old classic, and yet the composer had never heard that particular classic. This imitation is almost certain, when it is considered that there are actually only twelve different tones in the scale as it is played on the piano. The old masters had a virgin field when they were composing. The popular composer to-day uses only parts of those twelve tones, and yet it is immediately duplication. It only takes two notes to make a tune, and some of the most popular songs in recent years have been based on a two-note combination. And I also know as a fact that the composer was unconscious of the fact that the same combination was used by the great composers.

Sigmund Spaeth, the noted music critic, one of the few real authorities on music who has made an honest study of popular songs, has found considerable merit for which he commends the composer. This critic and author, in his recent book "The Common Sense of Music," says: "If writers use the same plots, characters and literary forms over and over again, why should not the composers of music have the same privilege?"

The successful popular composer of to-day, who is being given credit for the so-called jazz music, is sincere. He is always striving for that wide appeal, and I am confident that in the future he will be given more credit for his endeavors. Many of the recent song hits were composed with no thought whatsoever of jazz as the term is used by musicians; instead, he had in mind a song with a melody that would appeal to the heart—lyrics that would appeal to the mind, and with a rhythm to appeal to the feet. Because the song is successful and played by practically every dance orchestra, it is called jazz; but that is not my idea of jazz.

Jazz music, to a musician, means music that appeals strictly to the feet and without much thought of melody, and is usually considered by them as the "down South negro type" of blues.

The most popular songs of to-day are of the ballad type, and usually the result of untiring work on the part of the composer; and it is a great injustice to the composer, as well as to the song, to term it jazz. Many musicians themselves are partly to blame for the misconceived thought as pertaining to the word jazz. Careful enough attention in the past was not paid to the melody of popular songs, with the result that they were so syncopated and such radical effects used that the appeal to the heart and to the mind was entirely lost. With many orchestras playing this style all over the country, it would only be natural that the general term of jazz would be applied to all of the popular music.

However, I am glad to notice such a vast improvement in orchestras throughout the entire country. It has been my good fortune recently to hear many "local" dance orchestras, and the improvement is a great credit to the earnest endeavors of the musicians. There is no doubt but that phonograph records by the leading orchestras have been a source of inspiration to these different dance organizations, and all with the result of better music for dancers everywhere.

If, years ago, when dance music first began to be so very popular, it had been possible to have records of the leading dance orchestras, I believe that the term of jazz would only be applied to its rightful type of music, and that the dance music as played to-day would be known as *American Dance Music.*

What Gottschalk Said to Carreno

By Whitelaw Saunders

Perhaps this advice from a famous pianist to a nervous pupil, a pupil who was destined to be known as the world's greatest woman pianiste, Madame Teresa Carreno may bring its soothing comfort to some students of the present day who are to play for others.

The anecdote concerns Louis M. Gottschalk, and is from a letter written by Madame Carreno shortly before her death.

"At one of my lessons with my great teacher, L. M. Gottschalk, when a child of nine years, and owing to my having been ill and not having been able to practice as I should have done had I been well (not that I was eager to practice much, at that time, but my dear father took care that I should do the necessary practicing without over-tiring myself), my father explained to Gottschalk why I had not been able to do the necessary amount of pianistical work and be better prepared for my lesson with him and felt very nervous as a consequence.

"Gottschalk, thereupon, took me by the two hands and made me stand before him and, looking at me in his kind but serious manner, said to me: 'My dear little Teresita, *never* feel nervous when you play before a true artist and a great pianist. The true artist, the great pianist, only listens to what you play *which is good* and pays no attention to any shortcomings.'

"Great words and a great truth spoken by a great, great pianist."

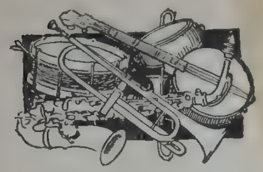
Yours sincerely,
Teresa Carreno.

"Stop, Look and Listen!"

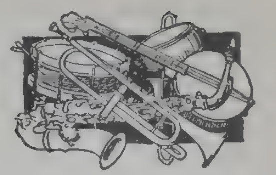
By Harold Alphons Thomas

A Musician who disregards the tempo of a piece is like a motorist who disregards the speed limit of a city through which he is traveling. They "plunge on" regardless of the "speed limit," but sooner or later "get caught."

Observe the "time" of the compositions you play, and it will more than pay. Many a good selection is ruined by a musician who disregards this.



Jazz—Lowbrow and Highbrow



By the Famous Critic and Author

HENRY T. FINCK

Mr. Henry T. Finck, after forty-three years of remarkable service as critic of the New York EVENING POST, *has resigned to devote himself exclusively to writing. Many of his books have been exceptionally successful. Mr. Finck will reside in the Riviera and in Switzerland. Future musical articles from his pen will appear in* THE ETUDE. *His discussion of the jazz problem is particularly interesting.*

IF you ask fifty-seven different musicians for a definition of Jazz you get fifty-seven different answers.

Does this mean that there really *are* fifty-seven kinds of Jazz? Not necessarily, although I was almost convinced there must be at least that number when I came across the following advertisement in a magazine:

"Piano Jazz"

"By note or ear. With or without music. Short course. Adult beginners taught by mail. No teacher required. Self-instruction course for advanced pianists. Learn 67 styles of bass, 180 syncopated effects, blue harmony, Oriental, chimes, movie and cafe Jazz, trick endings, clever breaks, space fillers, saxophone slurs, triple bass, tricked harmony, blue obbligato and 247 other subjects, including ear playing and musical invention. One hundred and ten pages of REAL jazz. 25,000 words. A postal brings our FREE Special Offer."

If *that* isn't American—as American as Barnum—I'd like to know what is. Yes, ladies and gentlemen, we have given the world a bran' new branch of music. You bet! Hooraa!

The Word is African

But hold on—isn't this new branch of music really African?

Well, the *word* may be, but what's in a word? Probably the following, which appeared some years ago in the New York *Sun,* comes as near the truth as we can get:

"The word jazz is African in origin. It is common on the Gold Coast and in the hinterland of Cape Coast Castle. In his studies of the Creole patois and idioms in New Orleans, Lafcadio Hearn reported that the word jazz, meaning to speed things up, to make excitement, was common among the blacks of the South, and had been adopted by the Creoles as a term to be applied to music of a rudimentary, syncopated type. In the old plantation days when the slaves were having one of their rare holidays and the fun languished, some West Coast African would cry out: 'Jazz 'er up!' and this would be the cue for fast and furious fun."

Just so in vaudeville, "jazz her up" means "put in pep and ginger." Not necessarily speed, for "an exceedingly popular jazz is the slow drag."

But if the word is African, how about the thing itself? Is jazz African, Afro-American, American, European, Chinese, or what?

Answer: All of these things combined. It is a *mixtum compositum,* an *e pluribus unum* like the United States themselves.

Partly, no doubt, jazz—lowbrow jazz—is African. To our ears, indeed, there would be something decidedly jazzy about most of the musical performances of wild African tribes as described by explorers and missionaries. What with their drums and gongs and rattles and an endless variety of instruments unknown to us, we would feel like calling them musical orgies rather than performances.

And yet I am sure Percy Grainger is only one of thousands of highbrow musicians who would, like myself, be hugely delighted if they could listen now and then to some of these musical orgies in place of the dismally "civilized" entertainments usually given in our concert halls.

Boisterous and Barbaric

We must, however, be on our guard not to assign a Negro origin to everything we hear that is boisterous and barbaric. The other day I read in a newspaper that the Parisians still like the Negro style of jazz, in which the players indulge not only in musical horseplay, but also, in gestures and antics of the same style. But it was in a description of a performance of a white jazz band that I read about a banjo player who tossed his instrument in the air; also of a piccolo player who, when drunk, indulged in "wild, barbaric, lawless sounds;" and also, concerning another player, "when he put his tomato can on the end of his cornet it seemed as though the music, with its strange quivering pulsations, came from another world (one guess as to which world)."

Banjo, Saxophones and Slide Trombones

The banjo is an African instrument, yet it was at a concert by Paul Whiteman's orchestra of white men that I heard the most amazing stunts ever performed on it—a whirlwind of sound that took one's breath away.

The saxophone is an essential ingredient of a jazz band, but the saxophone is not African. It was invented by a Belgian called Sax, and thousands of American boys play it at home, in school and in processions. The French army adopted it many decades ago.

The late Victor Herbert's attitude toward saxophones was amusing.

"I can write for them," he said, "but I never could conduct them. They make me nervous."

The trombone, too, is not African, and what would jazz be without the trombone?

It is significant that the first trombonist of the Boston Symphony Orchestra, Fortunato Sordillo, four years ago wrote a book entitled "Art of Jazzing for the Trombone," in which he says that the term jazz as used in his book "is practically synonymous to glissando." "For humorous effects," he adds, "the jazz trombonist burlesques his glissando by smearing the tones." He refers to Ravel's "Rhapsodie Espagnole," in the fourth movement of which there is a passage where the first violins play an ascending chromatic glissando and at the same time the cornets and trombones have glissando passages; the whole effect being a sort of glorified jazz. Yet this was not played by dance hall performers, but by the Boston Symphony Orchestra.

There is another jazz book on the trombone. Its author is Henry Fillmore, who says: "The jazz effect in music is supplied by the humorous qualities of instruments. In the brass family the slide trombone, because of its slurring possibilities, may be called the premier jazz producer." It is with this slurring (jazzing) characteristics of the slide trombone that his book deals. But that is only one of the many (fifty-seven?) aspects of jazz.

Ragtime not the same as Jazz

In the minds of many persons, jazz is foolishly mixed up with ragtime and syncopation. These, also, are often attributed to Negro influences; but, as Nicholas G. Taylor wrote to the *Musical Courier* from Sierra Leone, South Africa, "there is more syncopation in Bach's *Well-tempered Clavichord* than has ever been used in the whole realm of jazz music, which is more closely associated with the fox trot, the one-step and other steps."

A good snapshot of jazz playing has been penned by Gamewell Valentine: "Syncopated music is almost explained in its name. In this kind of music the accent is shifted from a regular strong beat to a weak or unaccented beat, making the time seem ragged. But jazz music is syncopated music that has become demoralized by harsh and superfluous embellishments. The more complex the embellishments and the greater the variety of brutish noises, the more perfect the music approaches jazz as a limit. All sustained tones are repugnantly colored. All pauses and rests are substituted for sharp and repulsive additions. Jazz music is saturated and concentrated to its ultimate capacity. When made by an orchestra, the unharmonious, simultaneous jazzing of the cornet, violin, trombone, saxophone, drums and xylophone converges into a tuneless medley; time, not rhythm, only remains."

"The Grandpapa of Jazz"

Such musical pandemonium, such "fast and furious fun" is clear above all things to lovers of jazz. But it is far from being a new thing under the sun. Savages, barbarians, ancient civilized nations, in their orgies, had it. So, perhaps, the scholarly Carl Engel, chief of the music division of the Library of Congress, has bestowed too much honor on Philippe Musard in calling him "the grandpapa of jazz."

Musard lived in Paris, 1793-1859. His orchestra of 70 at the Bals de l'Opéra included fourteen cornets and twelve trombones. "At some phrenetic climax of a quadrille the tonal volume of these instruments would be increased with the racket produced by the breaking of chairs or the firing of pistol shots. The dancing multitude howled."

Symphonic and Operatic Jazz

Now let us change the scene from ball room to concert hall. "After a long pause begins the third part with the rugged *Frère Jacques.* It sounds like a grotesque funeral march à la Callot. A muted double-bass begins, a bassoon and cello follow, then bass tuba and a deep clarinet. An oboe bleats and squeaks thereto in the upper register. Four flutes with the cornet drag the orchestra along with them; the shrill E-flat clarinet quacks; over a counterpoint in the trumpets the oboes are tooting a vulgar street song; two E-flat clarinets, with bassoon and flutes, parodistically pipe wretched stuff, accompanied by an m-ta, m-ta in the percussion."

No, gentle reader, the above is not a description of a novelty played by a Lopez or Whiteman jazz band. It was written by Paul Stefan about the first symphony of Mahler, whom Willem Mengelberg regards as the equal of Beethoven, if not the superior.

To be sure, the bark in this case is worse than the bite; in other words, Stefan's description is rather more jazzy than the music he describes. But Mahler liked jazzy effects in music, as when he doubled the piccolos, whistling shrilly through the storm-bent ship's masts in Wagner's *Flying Dutchman* overture.

Richard Strauss was fond of jazzy effects. His best-known efforts in this direction are in *Till Eulenspiegel's Merry Pranks, Don Quixote* and *Salome.*

The jazz writers and players of our day make a specialty of muted instruments, especially brasses. Strauss anticipated them so far as the tuba is concerned. A muted tuba is heard for the first time, with other muted brasses, in the sheep episode of *Don Quixote,* where the baah sound is thus cleverly imitated.

Rather jazzy, too, is the practical joke played by some noble dames on the Don and Sancho, who were placed blindfolded on a wooden horse which is to transport them through the air thousands of miles to a place where a giant will meet them in combat. The whistling of the wind about them is indicated in the orchestral score by chromatic flute passages, harp, and drum roll, in addition to a special wind-machine.

Of operatic jazz, there is a gruesome example at the moment when the horrible Salome peers into the cistern while Jochanaan's head is being chopped off. There is a sound like a stertorean groan produced by pinching the highest string of the double-bass (playing all alone) at a place between the finger board and the bridge, and sounding it by a quick jerk of the bow.

There is a donkey in Puccinni's opera, *Sour Angelica,* which gave him an opportunity to indulge in an orchestral braying joke. It is as cleverly done as the baa-ing of the sheep in Strauss's *Don Quixote.*

New Realms of Sound

I have just said that jazz players make much use of muted instruments. Audiences greatly enjoy these sounds. Fritz Kreisler and other great violinists produce some of their most ravishing effects with the sordino; their predecessors have done so for many generations. There is nothing African about it.

In the other direction—the augmenting or amplifying of sounds—the jazzmen are pioneers, and they deserve much praise for their innovations, which point the path to timid symphonic writers, afraid of doing something new.

"What do you think," writes an enthusiast, "of a trombone that sings through a megaphone with a perfectly legitimate tone, full of vibrato (not tremolo), and sounds more like a magnificent baritone voice than anything else, an entirely new tone color for any orchestra—only 'any' orchestra doesn't have a trombonist that can produce it." Paul Whiteman's band has him.

On this point, Whiteman has remarked with pardonable pride: "There is no orchestra of similar size that can offer anything like the variety of tone combinations that a jazz orchestra such as mine has. Nor do I know of an organization anywhere with so many virtuosos on their special instruments. My wood and brass men, of course, have to know at least half-a-dozen times as much about their instruments as a symphony orchestra player on the same ones. The possibilities are there, we make a demand for them—and the men respond. Who ever heard of a portamento on the clarinet such as Ross Silman plays? Technically speaking, there is no such thing on the clarinet—but there it is."

The plain truth is that our highbrow composers have got too much into a rut, copying the instrumental technic and combinations of European masters with tiresome monotony instead of finding new things for their own use. Thus it has come about that jazz gets credit for everything new that comes along. Let me give an interesting illustration of this statement. In a recent number of the *Popular Mechanics* Magazine I found pictures of several new instruments which the editor's headlines classified as jazz. "Musical Plug for Horns Creates Jazz Tones" is the heading for one of these, and we read concerning it: "Distorting the tones of cornets and trombones to get 'jazz' music may be accomplished by a recently invented device that fits the bell of the instrument like a plug. Moving it back and forth produces wavering, mute sounds. It can also be fixed so that the pitch will not change. A perforated disk over the end of a vibrator at the end of a metal tube blends and spreads the notes to a peculiar blare."

"Jazz Instrument Minus Keys 'Played' by Humming" is another heading. Concerning this, we read: "Producing music with a 'jazz' effect, a keyless reed instrument is being made which can be 'played' by any one who can hum a tune. Equipped with a rest, it can be kept in the proper position without being held by the hands, and can be used to accompany any selection. Having sufficient volume and carrying power, it is suitable for orchestral work."

It is obvious that along such lines an endless variety of new musical sounds can be devised. How infinitely more interesting this is than the silly imitating of foreign cacophonists who perpetrate commonplace melodies dished up in dissonantal sauce.

The Foolish Cacophonists

I do not know anything in the world quite so foolish as the attitude of these so-called futurists. They admit frankly that their music is ugly, nay, hideous; but in ten or twenty years, they say, it will be liked. Little do they know the public! Imagine women and men going patiently for ten or twenty years to listen to things that distress their ears and bore them to death, in the hope that they will like them ultimately! How long does a radio fan listen to a thing that bores him? If the futurists had their way, all concert halls would soon be closed indefinitely.

Fast and Furious Fun

How much wiser the jazz makers! They, too, sometimes make ugly music, but they do it with comic intentions, which makes all the difference in the world. In the last analysis, the quintessence of jazz is fun, or humor, ranging from horseplay to the exuberant outbursts of animal spirits in great men.

Schubert used to amuse his friends by putting tissue paper over a comb and singing his *Erlking* through it. That picture of the greatest of all song writers thus singing his biggest song with muted sounds and comically exaggerated expression gives a better idea of "American" jazz than anything I know of. But Schubert was not an American. Let us be modest. Now listen. If the greatest of all song writers was willing to "jazz" his greatest song, why should we raise our hands in horror at the "jazzing" of other classics by cabaret bands?

This sort of thing may even have an educational value. Theodore Thomas used to say that all that the people needed to like good melodies was to hear them often. Thousands of cabaret goers hear good melodies over and over again, more or less distorted, and many doubtless thus learn to like them afterwards in their virgin beauty.

America is learning classical music through the jazz versions played by the dance orchestras, says Vincent Lopez, the leader. "There is something in the rhythm off jazz," he claims, "which makes you remember it without effort. Only musically educated persons can hum a representative number of famous compositions. And yet every one hums the jazz tunes almost unconsciously."

Hints to Bandsmen

Charles L. Buchanan has said of Percy Grainger that "he amalgamates the music hall with the concert stage." High-brow jazz, in the widest and most flattering meaning of the word, reaches its pinnacle in such works as his "In a Nutshell," in which he introduces new percussion instruments like the Deagan steel marimba, the bass marimba xylophone and the Swiss staff bells. His example opens limitless vistas of novel sound effects. Conductors of jazz bands will learn much to their advantage by looking over Grainger's compositions.

They can make use also of the amusing "Carnival of Animals," by another distinguished composer, Saint-Saëns. I shall never forget how keenly and hilariously the most serious-minded audience in New York enjoyed the performance of this specimen of high-brow Jazz by the Beethoven Association in Aeolian Hall.

American men could be more easily lured to concert halls if humorous works like that were frequently introduced. On this subject I have written in my latest book, "Musical Progress," under the head of "Don't Be Too Awfully Dignified." Concert-going is at a low ebb just now. It could be "Jazzed up" by heeding the advice given in that chapter better than probably in any other way. Nothing pays like humor.

A Hand-Made Baby Grand Piano That Was Made by One Man at Home

Would you have the patience, the energy and the endurance to make a piano in your parlor and in your back yard. Here is the story of an amateur musician in Galesburg, Illinois, who gratified his desire to possess a grand piano by making it himself at home. His name is Earle F. Olson. Mr. Olson is of Swedish ancestry. When his grandfather came to this country he brought with him as a proud possession a small reed organ. The love of music was bred in the family, and Mr. Olson was sent to Augustina College where he also studied the piano and made unusual progress.

E. F. OLSON
With his "Home-Made" Piano

The great war broke out and Olson volunteered. This interrupted his musical studies but did not abate his desire to become a player. He became a recruiting Sergeant and also a drill Sergeant in large mid-west cities, thus enabling him to hear much music in his spare time. Coming back from service he was fired with the desire to go on with his music. He had no piano and no prospect of getting one. "Necessity is the mother of invention;" and he started in his own home to make the instrument pictured upon this page.

"Nothing can restrain ambitious man" sings the poet. Olson worked 3,650 hours, scraping, sawing, carving, hammering, boring, drilling, pulling, hauling. Over four hundred, eight-hour days, in order that he might have an instrument. The piano was started in February, 1922 and completed two years later.

Ordinary Household Tools

The only tools that Olson had were ordinary household tools. Included in these was a cross cut saw, already broken into two parts. Some of his tools he was obliged to make himself. He started work in the "front room" of his home. Part of the work of shaping the case was done in his back yard. The work bench was in the kitchen. The case demanded that he make his own clamps for holding the veneer together while being glued. In this way he glued together fifty-five layers, making the final layer of mahogany in order that it might take a polish.

Made His Own Frame

The iron frame of the piano was made by Mr. Olson personally, as he had had experience as a moulder. It took six weeks to make a wooden cast or pattern. Finally the iron was poured in the cast and the frame came out excellently. In this he drilled 604 holes to retain the pins to hold the strings. The keys were made by hand and covered with an ivory like composition. All of the parts were made with greatest attention to accuracy. One sixteenth of an inch out of the way in some operations would have ruined the completed instrument.

The extraordinary thing about the making of this instrument is that it was made by one man working alone. In most piano factories the piano passes through the hands of dozens of expert workmen. Mr. Olson had literally no plans, but by means of a ruler measured the parts on a piano of excellent make and made his to correspond accurately. The only assistance Mr. Olson had came from a piano tuner who tuned the piano when completed and advised Mr. Olson upon the matter of measurements.

The piano consists of 5500 pieces. The woods used in the case are oak, pine, spruce, birch, walnut, mahogony and ebony. Lining the pin holes and slots with felt was a big task in itself. The case of the piano has nine coats of varnish and two of shellac, all rubbed down by hand with pumice. The steel strings exert 26 tons of pressure upon the iron frame.

The first piece played upon the piano was an original composition of Mr. Olson.

To all ambitious people who desire to follow his path Mr. Olson has only one word of advice: *"Don't."* It is cheaper and quicker to let the real piano man in the piano factory make the instrument; but, as an example of perseverance, patience and endurance in the achievement of a desire, Mr. Olson's piano is no small monument. "We can do anything we really want to do if we set out to do it in the right spirit and keep at it long enough." The Etude is indebted to Emily Hamerstrom of Galesburg, Ill., for the information contained in this description.

Remember! Remember! Remember!

By Harold Mynning

Remember to relax the wrist when playing arpeggios and chords. Students often tighten the muscles of the arm when playing exercises that require that the hand be spread, and this is unnecessary.

Remember to count aloud when you come to the middle and last section of a piece. Many students start to count aloud at the beginning of a piece, but soon cease counting at all.

Remember to keep your thumb relaxed when turning it under the hand. This is highly essential for smooth scale playing.

Remember to listen to and criticize your own playing in the same detached way you listen to the playing of others.

Remember to keep the nail joint curved in. Never let it bend out.

Remember to practice regularly.

Tunes

By Giulio di Conti

"I find it difficult to master my liking for tune," writes James Agate. Most people find it impossible.

Boston took just pride in her early recognition of Wagner's genius and did nobly in furnishing respectably filled houses for the first seasons of the presentations of his works. Then came a company producing "Il Trovatore," and the doors closed with long queues awaiting admission. As the audience left after scenes of the wildest enthusiasm, one of the "Hub's" most respected critics was heard to remark, "Well, Boston still likes a tune."

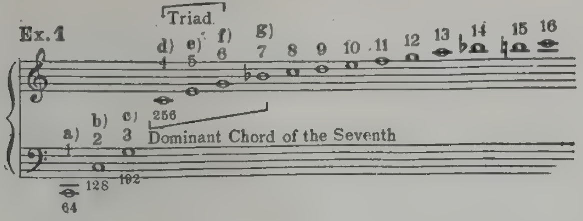
In spite of our friends of "Modernism," the stubborn fact remains that every composer who has moved the world has been a writer of tunes. Every piece of music which the world has taken to its great heart has, among its other art qualities, included a "tune" which sang itself into the very soul of the performer and hearer. My dear Mr. Agate, do go right on, happy in the enjoyment of your tunes.

The Scale of Nature. Some of the Interesting Phenomena Which it Reveals to the Music Student

By LEROY B. CAMPBELL

AUTHORITIES differ as to the notation of the extreme upper tones of the scale of Nature, but for all practical purposes and for ease in remembering, the following series will answer any consistent demands:

Ex. 1



This scale is said to have been known by Pythagoras 582 B. C., and was used in many experiments by Guido in the 11th Century.

Take the string (a) as a resonator, set it into vibration by plucking or striking it and it will, by means of sympathetic vibrations, give off fifteen overtones as shown in Example 1.

If two strings are of equal length and pitch and one of the strings be set into tonal vibration, the other string will also sound because of the sympathetic vibrations.

When any string as the one in Example 1 at (a) is set into tonal vibration, it instantly vibrates throughout its entire length; within a fraction of a second this string segments into two equal halves which half-length vibration will sympathetically set into tonal vibration the string at (b) an octave higher. The string (a) continues to segment in thirds, fourths, fifths, etc., each segment continuing to start sympathetically into tonal vibration the respective tones at (c), (d), (e), etc.

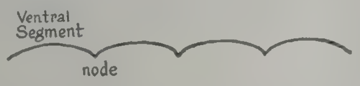
These tones sympathetically started are called by various names, harmonics, partials, overtones, aliquot parts, etc.

The tone at (b) has 128 vibrations per second while the one at (a) has 64 per second.

To get the vibration of any tone in the series multiply the number of the tone by the vibrations of the tone at (a) which is 64.

A vibration may be graphically shown thus:

Ex. 2



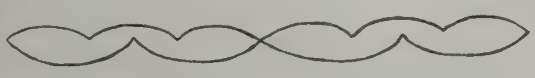
Sound is heard in waves, that is, a soft part followed by a louder part. The soft part is the long oval part of the bow and is called the ventral segment while the more intense part is at the end of the bow and is called the node.

When the strings corresponding in pitch to the tones (a) and (b) Example 1, are in vibration sounding together, the nodes in (a) and (b) are as two to one; that is, the nodes agree or come together every other vibration.

Ex. 3

In case of tones as at (b) and (c), Example 1, sounding together, the nodes meet three to two, thus:

Ex. 4



These tones agree almost perfectly while with such tones as at (b) and (i) the nodes meet as 9 to 8

Ex. 5

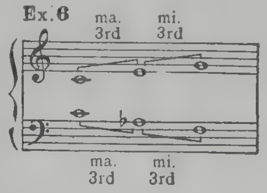
and the tones are very dissonant.

A tone is relatively sweet or harsh according to the frequency with which the nodes come together. The nodes in the tones as at (a) and (b), (b) and (c), and (c) and (d) come together so frequently that the tones may be called very sweet or consonant. For this reason, in the study of harmony these tones are called *perfect* intervals. Of course they are not absolutely perfect, since each succeeding interval is a trifle more dissonant than the preceding one. As will be noted in the remaining intervals (the 2nd, 3rd, 6th, 7th, etc.) the nodes do not come together so frequently so that other intervals are classified in proportion to the frequency with which the nodes meet in vibration (perfect consonances, imperfect consonances and dissonances).

Source of the Common Major Triad

The source of the major triad is easily found in the *scale of nature.* In Ex. 1, the overtones at (d), (e) and (f) make the common major triad, while reciprocal under-tones from the minor triad

Ex. 6



Source of the Dominant Chord of the Seventh

Turning to Ex. 1, once more note that the overtones at (d), (e), (f), (g) form the familiar Dominant Chord of the Seventh (c. e. g. & b.). This seventh chord, because it is found in its indentical form in the scale of nature or primary scale, is called the Primary Seventh Chord as opposed to the other seventh chords which are called Secondary Seventh Chords.

Source of Near Related Key

Not a few students, upon being told that the G major scale is the next nearest major scale related to C, ask why this is so. The answer may be easily shown since in the scale of nature, see Ex. 1). The first new tone after the resonator C in the series is G. This second overtone from any given tone as resonator is always identical with the fifth tone in the major scale which, according to the common rule, becomes the key-note for the next nearest related major scale.

The Source of the Major Scale and the Relative Importance of the Various Tones in it

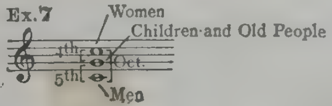
It is interesting to trace a rather plausible theory of how man, in his musical gropings, might have been influenced in forming the tones of the scale, and why he chose certain tones. and chords much more frequently than others.

It may be easily granted that the physical condition of man or animals through many generations might be influenced in a certain direction. For example, a dog always turns around a couple times before he lies down; his progenitor the wolf did this of necessity in the thick grass or bushes in order to make a trampled place to lie.

A man does not need much encouragement to get into a fight or a war; he may be finely dressed and appear very highly civilized as he walks or drives down the beautiful city avenues; but under this thin veneer is the old inherited disposition and tendency. For thousands of years he was a fighter; he fought animals, the elements, and enemy tribes who encroached upon his borders. At the least provocation in this day up come his fists, pistols, guns, cannons, warships, or what not in defense!

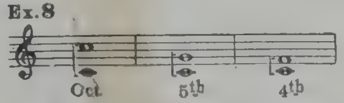
By means of this same theory of inheritance a very interesting source of the scale may be found. In the dim and distant past men sang only in unison. There being male and female, the interval of the octave was immediately established, since the female voice is pitched an octave higher than the male voice. The children as well as older men and women would join in the singing but not being able to sing as low as the average men or as high as the majority of the women, these children and older people would join in at a pitch which was most primary and natural (see Ex. 1, the first nature tone after (b) is the tone at (c) a fifth higher). Therefore we find these primitive people becoming thoroughly acquainted with the intervals of the perfect octave, the fifth and fourth.

Ex. 7



Or from any given tone, they knew and heard over and over these intervals:

Ex. 8



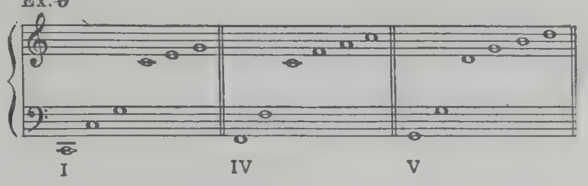
These pitches in this or any key in which they chanced to sing ever emphasized the I, IV and V or tonic sub-dominant and dominant in their mental and physical organisms.

In the ear of a man is found some very fine and sensitive little harp-like filaments, called after the Italian who discovered them, filaments of Corti. In these primitive peoples who heard a great predominance of certain intervals for so many ages it is not strange then if these filaments of Corti should become developed with a physical and natural tendency towards I, IV and V.

Any organ that is exercised grows and these filaments therefore would develop and gradually assert themselves in the physical organism through inhertiance.

The tones of the intervals I, IV and V would affect these filaments in the order noted in the Nature Scale, at least through its first six overtones which naturally are the strongest ones;—

Ex. 9



Naturally the tones most used in the overtones of I, IV and V as resonators would be the ones most firmly impressed upon the filaments of Corti and by inspecting Ex. 9 the relative importance of each tone is revealed by the number of times each tone appears.

No. 1—c appears 5 times.
No. 2—d appears 2 times.
No. 3—e appears 1 time.
No. 4—f appears 3 times.
No. 5—g appears 5 times.
No. 6—a appears 1 time.
No. 7—b appears 1 time.

It is found therefore that there are seven different tones (a complete scale), 1 and 5 are the most used tones while 4 and 2 are next in importance, and 3, 6 and 7 are used least. Apply this proportion to tones used singly or as fundamentals of chords throughout the pages of musical literature of the past and present, and it will be found that the above theory is very consistent. It might be added that this theory makes a most satisfactory explanation of the reason for folk-songs and popular music being invariably built upon the chords of I, IV and V.

The Relation of the Scale of Nature to the Damper Pedal

As the lowest tone (c) in Ex. 1, used as a resonator, when sounded gives off quite distinctly the first six overtones as in Ex. 9 in like manner any tone used as resonator will produce a relative series of overtones. Try the experiment for yourself. Press down the keys (c, e, g) with the R. H. marked major triad in Ex. 1 without sounding them. Then sound with the L. H. the low (c) momentarily and it will be found that the tones of the triad which are being held will sound quite distinctly after the low (c) ceases. Reverse the process by holding the low (c) with the L. H. without tone, while the tones of the triad (c, e, g) are sounded with the R. H. Let these three keys up and the three tones will still continue to sound by reason of the sympathetic vibrations taking effect in the relative segments of the low string (c) held down by the left hand.

This same phenomenon of course takes place not only with (c) as a resonator affecting its triad (c, e, g), but with any key with its relative triad on the piano. Many and varied are the special effects which may be brought out by means of the pedal and sympathetic vibrations. Enough could be written on these special effects to make a long article but what is intended to be noted here is the primary effect of the manner in which the tone i[illegible] always enriched whenever the damper pedal [illegible] ployed. [illegible] matters.

Hemholtz states that the quality of a to[illegible] This may
improved by the presence of the lower over[illegible] other col-
the damper pedal is pressed properly, ove[illegible] 117. Even
fect harmony are set into vibration all [illegible] is gradually
which greatly enriches the tone especi[illegible] getting a good
sympathetic vibrations come into being [illegible] is why, after
pleasant perm[illegible] this manner of [illegible] a child often
like that [illegible] desirable harp whose to[illegible] ight that he has
and sound consequently [illegible] the piano key-
[illegible] rapidly in his
[illegible]cal attainments.

Why Are Parallel Fifths Forbidden in Harmony?

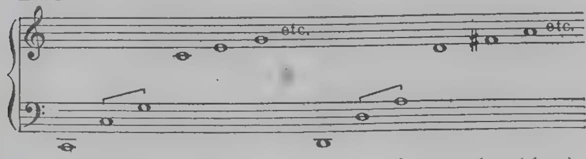
This bugbear of the harmony student may find an explanation by means of the scale of nature. Why do these fifths sound badly?

Ex. 10

Parallel Perfect 5ths

Fill around these fifths the relative scales of nature, e. g.:—

Ex. 11



The (c, g) in the scale at (a) moving to the (d, a) in the scale at (b) has a very boorish effect since one really hears the series of overtones at (a) and then he suddenly is thrown into the series at (b). This unprepared move from one family of tones into another is too abrupt and the ear objects. To move from one family of tones in the key of (c) to another series in (d) needs at least a slight modulation.

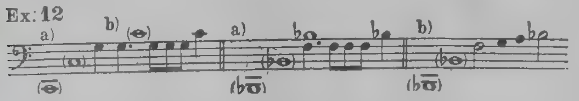
While this theory accounts for the crude sound of fifths from one degree to its adjacent degree up or down it would appear then that parallel fifths from I to IV or I to V, or vice versa, would sound all right, since the relation of the series of overtones on (e) to the series on (f) or (g) would be perfectly well-sounding and as a matter of fact the later day harmony books call these particular fifths good.

There are other reasons given why parallel fifths sound unsatisfactory; but I am citing this one since it sounds as plausible as any of the others and also because it finds its argument in the subject under discussion, the *scale of nature.*

Why Do Boys Call Out Their Newspapers in the Interval of the Minor Third?

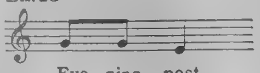
Not long ago I read in some work how the early tetrachord was founded. The theory was that the ancient Greek standing in the presence of his God chanted his own poetry to the God with the following natural inflection to his voice.

Ex. 12



Natural, because the next tone above the (f) or (g) in the scale of nature is the perfect 4th. (See above at (a) in Ex. 12.) It will be noted that bass and baritone voices naturally speak at the above pitch (f) while tenors speak at the pitch (g). Some chanter upon becoming tired, slurred the tones from (f) to (bb) as at (b) in Ex. 12 and in that manner the four toned tetrachord came into existence. I have asked many persons why the newsboy always uses the *minor third* in crying his 'Evening post."

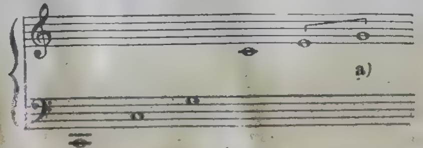
Ex. 13



No one has ever explained this to me so I offer this explanation and again this is based upon the *scale of nature.*

The boy's voice is pitched an octave higher than the man's voice, so the first tone he cries (the natural speaking tone of his voice) will be found the second (g) in the nature scale. (See Ex. 14 (a).)

Ex. 14



Since he pitches his voice lower for the next tone he would naturally take (e) the next tone lower in the scale of nature, which is a minor third.

Many other interesting phenomena and theories may
nd in this self-same scale of nature; but in this
only a few of the most common ones have

d plan to interest students in searching for
vhy certain things are thus and so. For
is the scale named c-d-e-f-g-a-b-c? Why
g? It would be much simpler to explain
learn the alphabet beginning with a.
rce of the major scale? Why are the
G and F? The v other ques-
udents many a and most tal hunch.
he slogan of

John C. Freund

(1848-1924)

The Etude notes with deep regret the death of John C. Freund, in April. Mr. Freund was a man of very great ability and remarkable energy. He was indefatigable in the cause of promoting a patriotic interest in the music of America.

John C. Freund was born November 22, 1848, in London, England. His father was a physician. He was educated at Oxford where he edited a magazine and produced one of his own plays. He came to America in 1871 and for a time divided his activities between trade journalism and theatrical interests. He then founded *Music Trades*, and later the excellent musical news weekly *Musical America*, interesting himself in what he called "the musical independence of the United States" and conducting an extensive propaganda which unquestionably gave impetus to musical endeavor in America. Mr. Freund was an able speaker and possessed a very forceful personality. His editorials were vigorous and fearless, and his influence in many directions in the music world will be greatly missed.

A Rocky Mountain Columbine

(A Parable)

By John Ross Frampton

A friend has sent me a pressed flower picked at my old home in Iowa. She wrote that the plant was a joy to all who saw it, with its ten or twelve large blue flowers. And friends here admired even the pressed blossoms, for they had never seen the flower in its freshness and beauty. It was a Rocky Mountain Columbine, and it made me think a bit.

Five years ago there grew a plant on the slopes of Gray's Peak, in Colorado. It lived about 11,000 feet up, almost at "timber-line," which is the altitude above which no trees can survive the terrific storms, where the nearest trees are dwarfed and beaten out of shape by the fierce pebble-laden winds which often tear away all the bark from the exposed side of the trunks. This plant had but poor, rocky dirt to grow in, and had drunk icy water which melted by day from the eternal snows above, and which froze around the base of the plant every night. Surely this plant knew what the struggle for existence meant! But how wonderfully beautiful was its bloom! Small wonder that Colorado should choose it for its state flower! Very few people had ever seen this particular plant, and those who had, had been possessed of sufficient judgment and self-control to leave it there untouched, to gladden the heart of some other tired climber.

One little girl had found it and watched it and finally gathered the ripened seeds and sent them to me in Iowa. They were small, black, hard seeds. I planted some in the good rich soil of Iowa, and they refused to even start to grow. I soaked some for days in water and then planted them, and they grew. When the little leafy stems were half an inch tall I had to transplant them, and, will you believe it, the roots were a couple of inches long? In the Fall I again transplanted them. The plants were possibly three inches high, but the fibrous roots went almost straight down about fifteen inches! The second summer the plant grew bigger, but attempted no blossoms. Only in the third year did it give some small blooms. But in this, the fourth year, it is glorious in its beauty.

And I thought of how patient and wise and careful Nature is, making sure first that the plant had roots enough before attempting the perfection of a blossom. And I also thought of the music students who are unwilling to lay any foundation, who have no patience for sending down roots, but wish to blossom out into brilliant showpieces as soon as there has been any growth whatever, possibly even before the leaves have come, and surely before there are any deep, stress-resisting roots!

Keeping Pianos Under Difficulty

The Department of Commerce at Washington has just released a report relating to pianos in Venezuela. We learn that the pianos may be heard continuously in almost every street in Venezuela. The tropical climate makes for open windows. The cement walls of the houses were not made to contain sound, therefore the sounds travel as far as their normal vibrations extend. A concert or a recital in one home does for the block.

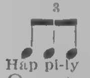
Our country supplies four-fifths of the pianos and player-pianos. The piano must be a wonder to withstand the conditions of transit to Venezuelan cities and when it gets there it is welcomed by more piano enemies than one likes to imagine. The piano may be carried up rugged mountain slopes on mule back. The white ant will make a meal of the wooden parts of the piano if the wood has not been cut during the proper season and thoroughly dried. The bottom of the piano must be sealed so as to keep out mice and innumerable varieties of insects. The metal parts must be coated with a non-corrosive finish. Even when painted or nickel-plated these parts are liable to rust in a few weeks and ruin the instrument.

Imparting Rhythm

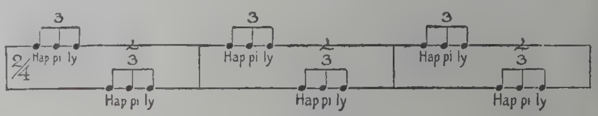
By E. M. Goldsmith

Simplicity must be the ruling factor with the teacher who is endeavoring to impart this vital principle in music. In the first place, counting with regularity is foreign to the mind of the beginner. Therefore the necessity of explaining in the most simple form, every detail relative to rhythm.

Illustrations of the simplest nature can be used to good effect in many cases where the pupil is not born with rhythm. Where the pupil has a fair understanding of 4/4 and 2/4 time or rhythm, I use illustration in 2/4 with exercises in triplets as a leader to the idea of 6/8 rhythm. The pupil must understand that the triplet eighths must be made in the same time as two-eighths, with the volume of accent of the count on the final note, I use the word "Happily" for the three-eighths, thus



Then the pupil counts the triplets in this form: One, two, three, four, five, six—accenting the first and fourth counts.



The Young Student's Stimulant

By Aletha M. Bonner

"Not an easy thing to do," says the teacher. Periods of lagging interest come to even the most talented pupil, and instructors are often at their wits' end endeavoring to cope with the situation.

Variety is one of the best of stimulators for waning enthusiasm. It is that delightful condiment which gives life a fine flavor and whets one's appetite for a solid, substantial diet; and truly does the youthful nature crave a liberal dash of this seasoning throughout the musical menu.

Diversity in teaching is as profitable to the instructor of music diversified farming is to the agriculturist. Indeed the child mind may be likened to a fertile field, where even with the most careful cultivation without rotation or variation, the yield will be of inferior quality and in time an absolute failure.

Avoid monotony, and the reward will be a keen manifestation of interest on the part of your pupils.

"There was a time when it might have been said with some truth that Americans were not a musical people. We have not the great traditions of some European countries, notably Italy, France and Germany. Like the English, we have not taken any form of art as seriously as we should. . . . America has made much progress within the last fifty years towards the creation of that musical atmosphere which is essential to the development not only of the public taste but also of the genius of the artist."—*Philadelphia Inquirer.*

What Is Your Vote on Jazz?

The Etude has already received a large number of votes on the Jazz problem; but to be fair to the question and to our readers we will not reveal the results at this time as it seems to us that a great many readers might not want to give their opinions until they had read this issue. Therefore, will you kindly send us to-day a postal giving your opinion? If you are in favor of the better class of Jazz, write us. If you are entirely opposed to Jazz, write us. Your name will not be revealed. Address, Jazz Problem, care of The Etude, Philadelphia, Pa.

The Teachers' Round Table

Conducted by PROF. CLARENCE G. HAMILTON, M.A.

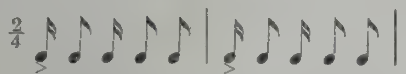
This department is designed to help the teacher upon questions pertaining to "How to Teach," "What to Teach," etc., and not technical problems pertaining to Musical Theory, History, etc., all of which properly belong to the Musical Questions Answered department. Full name and address must accompany all inquiries

Jazz and Its Effects

Two letters recently received ask questions relative to the modern development in music (?) called "jazz":

> (1) Please explain the meaning of the jazz that we read so much about. In one paper I read: "The people these days play by the jazz, they dance by the jazz, they sing by the jazz and they walk by the jazz." L. T.
>
> (2) I would like to take up the study of piano again after two years of playing nothing but jazz. I find that my technical ability for playing classic music has disappeared. Can you suggest a series of exercises which will give me sufficient practice to enable me to continue my studies in one or two months?
>
> I had just finished Bach's *Two-part Inventions*, when I was forced to stop my lessons. Those I can still play because they are ingrained in my brain and always will be; but if I try to play scales, arpeggios in thirds and things requiring such technic with any degree of velocity, I discover my deficiencies. Also, my touch has become hard and metallic. R. W.

(1) I venture to define jazz as a kind of music in which everything is subordinated to the expression of the "ragtime" principle. This principle consists in a continued use of an irregular and jerky rhythm of this sort:



In order to emphasize this rhythm, every kind of percussion device seems to be legitimate—cymbals, clappers, tom-toms, auto horns, dish-pans, shot-guns, and so on.

Through several hundreds of years civilized music has been undergoing a refining process which has succeeded at last in making it a vehicle for the expression of the subtlest shades of human emotion. This result has been accomplished by a discriminating selection of musical tone, by a careful adjustment between form, rhythm, melody and harmony, and by the final artistic treatment of all these factors. Jazz now comes to upset all the achievements of the ages, first by employing exclusively an abnormal and irritating rhythm, in which accents are constantly displaced, secondly by degrading melody and harmony almost to extinction, in favor of the blatant rhythm, and thirdly by substituting noise for tonal beauty. In other words, it demolishes the barriers of civilization, and returns to the savage and barbaric.

(2) Consequently, it is no wonder that a piano touch suffers from much jazz playing. Assuming that the best jazz player is the one who emphasizes the distorted rhythms in the noisiest possible manner, why stop at anything? Why not use arms, fists, sledge hammers, if they will contribute to the general racket? I once attempted to play on a piano (at a church service!) which had been used the previous evening by a popular jazz hero, and found that he had put eleven of the keys out of commission. No wonder he was adored by jazz devotees!

To get back to normalcy after two years of jazz playing is no small task, and will require much patience and perseverance. First of all, you must abjure jazz and all its works. As the most important factor in your reform, you must get rid of the stiffness in your arms and wrists, which is undoubtedly the cause of your technical clumsiness. Cultivate relaxation exercises, such as that of hanging the hand loosely from the wrist, rolling the hand loosely from side to side, and others which have been suggested from time to time in these columns.

You are then ready for a book of technical exercises. *The Complete School of Technic*, by I. Philipp, is admirable for this purpose. Keeping the principle of relaxation constantly in mind, practice each exercise with moderate and unforced tone, at first slowly, and afterwards at varying degrees of speed.

I should choose pieces that require a fluent touch, since this touch is what you should most cultivate. Here are a few to begin with:

Debussy: *Arabesque in G major*
Palmgren: *May Night*
Mendelssohn: *Capriccio, Op. 16, No. 2.*
Chopin-Liszt: *Maiden's Wish.*
Raff: *La Fileuse*

With two hour's *correct* practice per day, you should get back to civilizazion in a month or two. But don't forget to *relax!*

Training the Ear

> In the Round Table for December, 1923, you mention as one of the qualifications of an artist "evident musical talent." I am in doubt about this in my own case. My ear is keen to detect a discord, but I cannot correct it except when I look at the printed notes. I cannot make harmony "by ear." Is there any hope for me? Mrs. G. N. C.

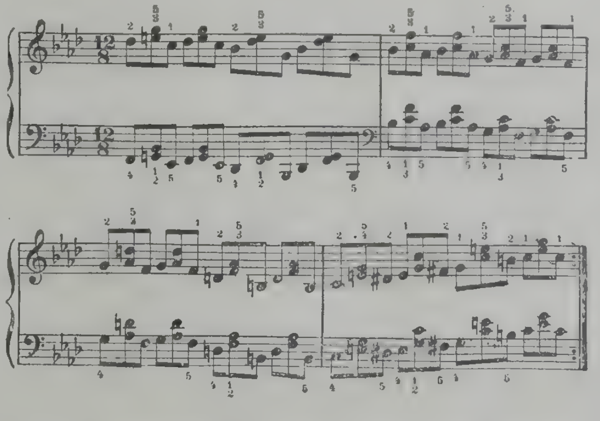
Evidently it is only a question of cultivating your aural sense, since, by your statement, you are far from "tone deaf." If possible you should join some ear-training class, in which you may have daily practice in recognizing intervals, simple chords, etc. Next best would be a class in sight singing, in which you would learn to make to order the intervals on the printed page.

If such class work is not available, get a good book on the subject, such as *Ear Training* by Arthur Heacox, and have some friend systematically dictate to you the progressive exercises which it contains. I see no reason why you should not remedy your deficiencies by persevering work of this sort.

Exercises and Their Effects

> (1) Kindly advise me what study or technical work to use as preparation for Mason's *Spring Dawn*, especially the passage work on page 2, to secure the light, graceful execution required.
>
> (2) I also would like to know just how best to use Pischna's twenty-fourth study correctly, and with what pieces.
>
> (3) Are the gymnastics for fingers, hands and arms as given now and then in the ETUDE liable to stiffen the hands? Mrs. G. E. G.

(1) The best kind of preparation for executing unusual figures in any given composition is to make little exercises out of these figures themselves, and to practice these exercises in a variety of ways, with hands together, slowly, faster, piano, forte, and with other variations. Take, for instance, a characteristic figure from the *Spring Dawn*. This figure may easily be turned into the following technical exercise:



Play the exercise at least a dozen times daily in the ways suggested above, also an octave higher and an octave lower than written. If the wrist be kept loose and the hand (with forearm) be allowed to rotate freely from side to side, the difficulties of such passage work ought to vanish.

(2) Number 24 of the Pischna series is an excellent exercise for drill upon broken chords in extended positions. It should be practiced, together with its variants, slowly and with firm touch, both staccato and legato. Its application may be found in any pieces or studies that involve arpeggio work, such as Moscheles' Etude, No. 11, from Op. 70; Schumann's *Prophet Bird*, Op. 82, No. 7; Sinding's *Serenade* and *Frühlingsrauschen.*

(3) Certainly the exercises which I give from time to time should have quite the opposite effect on the hands from that of stiffness. I am constantly advocating looseness of the arms and wrists. Of course the fingers must be held with a certain degree of firmness to produce tone; otherwise they will flop about on the keys like a fish out of water; but this firmness should be far removed from rigidity, and should be released when not actually required. One should, indeed, cultivate the habit of relaxing as far as possible after each single tone or chord has been sounded. The forearm and hand may be completely relaxed the instant that a staccato tone is played; and they should retain only enough muscular activity to keep the key down when a tone is to be sustained. Play your piece slowly, relaxing in this way after each note, and your hands will remain in a plastic condition even when you adopt a much faster tempo.

Useful Teaching Pieces

> Please suggest some pieces for boys in Grades III-VI; also some for adult "beginners" in Grades II-IV. E. S.

Cheerful music, with bright and active rhythms is best adapted to the average youngster. I therefore suggest the following:

	Grade
Bohm: Dancing Sprites	3
Delahaye: Minuet Columbine	3
Godard: Second Waltz	4
Kullak: From Flower to Flower, from Op. 48	4
Chaminade: Callirhoe, Air de Ballet	4½
d'Albert: Gavotte from First Suite	5
Wagner-Bendel: Prize Song from "Die Meistersinger"	5
Haydn: Gipsy Rondo	5
Bach: Loure in G	6
MacDowell: Witches' Dance	6
Schubert-Liszt: Hark! Hark; the Lark	6

NOW FOR THE OLDER ONES

Kuhlau: Sonatines, Op. 20, Nos. 1, 2, 3	2
Poldini: Valse Serenade	2
Schumann: Knight Rupert, Op. 68, No. 12	2
Grieg: Waltz in A minor, Op. 12, No. 2	3½
Schumann: Cradle Song	3½
Beethoven: Für Elise	3
Jensen: The Mill	3
Tschaikowsky: The Skylark	3
Massenet: Aragonaise from "Ballet Cid"	3½
Godard: Au Matin	4
Chaminade: Scarf Dance	4
Tschaikowsky: April, Op. 37, No. 4	4

A Very Young Pupil

MRS. A. B. C. writes that she has been giving piano lessons to her little daughter, aged five, beginning with a kindergarten method; that the child was at first enthusiastic, and insistent on having lessons, but that her interest seems to be on the wane, and that her greatest trouble is in understanding note-values. She adds:

> Can you suggest anything for her, and whether to go ahead; so she may keep up her interest, or to drop her music for a while?

I'm afraid that you are too ambitious for the little girl, who, from what you say, has made precocious progress for one of her tender years. It is the case with every pupil, that, after the first rapid spurt, progress seems to become much slower, and practice becomes more like real work. So keep the child in training by all means; and do not be discouraged if she apparently makes little or no headway for a time.

As to note-values, these will become clearer after she has developed her mathematical sense. Don't burden her at present with too complex problems of time-relationship, but let her appreciate these instinctively, by cultivating her sense of rhythm. Playing duets with her—such as those of Wohlfahrt, Op. 87, will help matters. Have you tried Presser's *Beginner's Book?* This may be supplemented by simple little pieces, or by other collections of early studies, such as Gurlitt, Op. 117. Even if she does not seem to advance much, she is gradually learning the language of music and is getting a good foundation for future development. That is why, after several years of apparently plodding work, a child often wakes up suddenly to discover with delight that he has obtained a very desirable mastery over the piano keyboard and consequently leaps forward rapidly in his musical attainments.

The Musical Scrap Book

Anything and Everything, as Long as it is Instructive and Interesting

Conducted by A. S. GARBETT

BACH'S KEYBOARD TECHNIC

In an article on "Bach and the Organ" contributed by C. M. Widor to a defunct English publication, and reprinted in a book called *Studies in Music,* we get the following interesting description of Sebastian Bach's technical methods at the keyboard. One should remember of course that his instrument was the harpsichord and not the modern pianoforte:

"This is the way in which Bach played the harpsichord. 'His five fingers bent so that their extremities fell perpendicularly on the keyboard, above which they formed a parallel line ever ready to obey. The finger did not rise perpendicularly on leaving the touch, but rather glided back towards the palm of the hand; in the transition from one touch to another, this very gliding imparted to the next finger the exact strength of pressure that had been put into force by the preceding finger; hence a great evenness and a touch that was neither thick nor harsh.' It is Philip Emmanuel who has given us this description.

"Bach had a small hand; the motion of his fingers was barely perceptible, as the first phalanges were the only ones that moved. His hand preserved the rounded shape even in the execution of the most difficult passages; the fingers were barely raised above the keyboard, just a shade more than in the playing of a shake. As soon as a finger had been used, he brought it back to its proper position.

"The remainder of his body took no part whatever in the work. It is only those whose hands are not sufficiently nimble that need to exert their whole frame when playing.

"Nowadays we do not play the harpsichord, and the pianoforte which has replaced it with great advantage requires methods and means that were hitherto unknown."

Singing appears to be the only branch of music in which the instrument counts for more than the person who plays upon it, or the manner of the playing.
—Sir C. V. Stanford.

TECHNIC AND INTERPRETATION

In a thoughtful little book entitled *Creative Technique,* written "for artists in general and pianists in particular," Mr. George Woodhouse has interesting things to say:

"Technic represents all an artist has to give," he reminds us; "whether he devotes himself merely to the making of pleasing tone, or is intent on conveying the musical thought, technique is the vehicle for both. There is no magic which works outside its medium——.

"There can no longer be any justification for mere virtuosity. The invention of the modern player-piano has made the most astounding technical achievement a commonplace effect, but it still leaves unchallenged the interpretive powers of the human touch. Music begins, not in notes, but in the living form which embodies its expression. What value then has a facile execution if there exists no musical impulse in the mind of the player.

"The quality which lends beauty in design is always to be preferred to that which is beautiful merely in itself. Every pianist must have a sense of rhythm and acquire a good touch, but mere technical facility is a more prevalent possession than the creative faculty, while rhythm is more often a means of marking time than a musical portent.

"The dual character of technic is evident; first the relation of the player's mechanism to the piano, which is governed by the simpliest laws in mechanics, and second, the relation of that mechanism to his personality, which is as complex as his temperament."

VON BUELOW ON PIANO-PLAYING

For his book, *Success In Music* (which all musicians should read), Henry T. Finck has collected some of the best of Von Buelow's sayings, in which that great pianist and conductor tersely gives some valuable hints to young students.

"Buelow's malicious sarcasm is exemplified in the following," says Mr. Finck:

"'Piano playing is a difficult art. First we have to learn how to equalize the fingers, and then (in polyphonic music, where one hand has to play at the same time parts of diverse strength) to make them unequal again. That being the case, it seems best not to practice the piano at all—and that is the advice I have given to many.'

"A few more general hints:—

"*Crescendo* means *piano.* You must not begin by being at once what you are to become gradually.'

"'An interpreter should be the opposite of a grave-digger; he should bring to light what is hidden and buried.'

"With reference to the first Brahms Ballade: 'To find the correct declamation, we should sing the melody.' He often did this for his pupils.

"Concerning Chopin's *Mazurka, Op. 50, No. 1* he said: 'In this Mazurka there is dancing, singing, gesticulating.'

"'If you think you have finished studying a piece, put it away a month. On resuming it you will discover new difficulties to conquer.

"'The bar-line is only for the eye. In playing, as in reading a poem, the scanning must be subordinated to the declamation; you must *speak the piano.*'

"A pupil who was mechanically playing a Beethoven sonata one day, was interrupted by him with a word. 'Please play a little with your head, won't you?'

"'Repose is the pianist's first duty.'"

HANDEL—"THE GREAT BEAR"

That brilliant novelist, publicist and music critic, Romain Rolland, has recently completed a new book, *Musical Tour Through the Land of the Past,* from which the following pen-portrait of Handel is taken. It is magnificently vivid:

"They used to call him the Great Bear. He was gigantic; broad, corpulent, with big hands and enormous feet; his arms were so fat that the bones disappeared in the flesh, forming dimples. He walked bow-legged, with a heavy, rolling gait. very erect. with his head thrown back under its huge white wig, whose curls rippled heavily over his shoulders. He had a long horse-like face, which with age became bovine and swamped in fat; with pendant cheeks and triple chin, the nose large, thick and straight, the ears red and long. His gaze was very direct; there was a quizzical gleam in his bold eye, a mocking twist at the corner of his large, finely-cut mouth. His air was impressive and jovial. When he smiled—says Burney—'his heavy, stern countenance was radiant with a flash of intelligence and wit; like the sun emerging from a cloud.'

"He was full of humor. He had a 'sly pseudo-simplicity' which made the most solemn individuals laugh though he himself showed an unsmiling face. No one ever told a story better. 'His happy way of saying the simplest things different from anybody else gave them an amusing complexion. If his English had been as good as Swift's, his *bon mots* would have been equally abundant and of the same kind.' But 'really to enjoy what he said one had almost to know four languages, all of which he mixed up together.'

"This medley of tongues was as much due to the fashion in which his vagabond youth was moulded while he wandered through the countries of western Europe, as to his natural impetuosity, which, when he sought a rejoinder, seized upon all the words at his disposal."

THE SURVIVAL OF THE GOOD IN MUSIC

The flood of music in the air, not all of which is of the best, has occasioned a lengthy article in the London *Spectator,* by C. Hann, who views it all with the modified alarm characteristic of this journal. But he finds comfort in the fact that "public taste is by no means wholly debased. It speedily rejects the wares of its exploiters as soon as their novelty is dimmed and passes on to newer fashions and further disillusionment. It is quick to discern the slightest spark of merit in the mass of mediocrity that is continually offered for its consumption. *Tipperary* was tried and proved in the crucible of patriotic emotions, and it came very near to permanence as the one folk-tune of the twentieth century"—the author is doubtless thinking of England only. A musician could see its weakness in an instant: the public eventually discovered them, and for this it should have credit. *Tipperary* was a good tune; and it was nearly a great tune. In higher forms of music the intricate texture, the subtle relationship of keys and rhythms, of themes and counter-themes are beyond the comprehension of an audience that has not even mastered its musical pothooks and hangers. But the greatest tunes are essentially a public possession. A surprising list could be made of the folk music, of the movements by Handel, Bach, Beethoven, Weber, Wagner, Chopin that are permanently treasured by the Philistines. In its transitory day, *Yes, We Have No Bananas,* though aided by a colossal expenditure in advertising, could not be compared as a business proposition with the lasting popularity of the *Largo* of Handel.

MALIBRAN'S TEARS

Malibran, one of the greatest singers of all time, had a charming wit, and sang at least as well as her sister, Pauline Viardot. She also possessed the interesting faculty of being able to weep while she sang, when operatic exigencies called for it. From her niece, Louise Heritte-Viardot, daughter of Pauline, and author of *Memories and Adventures,* we learn the following about Malibran:

"She was both clever and witty; her sayings and her letters prove this. Here is an interesting sketch of hers on the public: 'The public seems to me like a basket full of unlit candles. If you hold a great fire over them they will melt, but if you light them one by one they will produce a brilliant illumination. Well, I lighted my public one by one'

"She showed great self-control in private life as well as on the stage. Her intimate friend, Countess Merlin, asked her one day, after she had heard her singing the romance of *Desdemona* while tears coursed down her cheeks, how she could manage to sing so beautifully and yet to cry at the same time.

"'Oh, I had no need to practice it specially. As a child I often used to cry during my singing lessons, and as I did not want my father to notice it, I used to stand behind him, and so learnt to get full control over my voice, while my tears were flowing.'."

Her father was Manuel Garcia, who invented the laryngoscope and lived for more than a century. He was a great vocal teacher, a loving father, but something of a disciplinarian.

A PRIZE-FIGHTER AT A SYMPHONY CONCERT

With a due sense of the importance of the occasion we remind our readers of the visit paid by Jack Dempsey, world's champion heavy-weight "box-fighter," to Great Falls, Mont. The event had a musical significance. The huge crowd which received him was headed by the municipal band, and during the procession the champion got down from his automobile and, seizing the big drum, beat enthusiastic time to the music. We pity the poor drum, for Dempsey "packs a wallop" in each hand, as Carpentier could tell you; but the effect must have been tremendous.

But this was not all. From the sport page we learn that "Dempsey later appeared on the same stage with the Minneapolis Symphony Orchestra, the artists finding him out front much to their surprise, at the end of an intermission. When they recovered from their surprise they joined heartily in the applause given the champion, and Dempsey reciprocated by popping his big hands together in appreciation of the music."

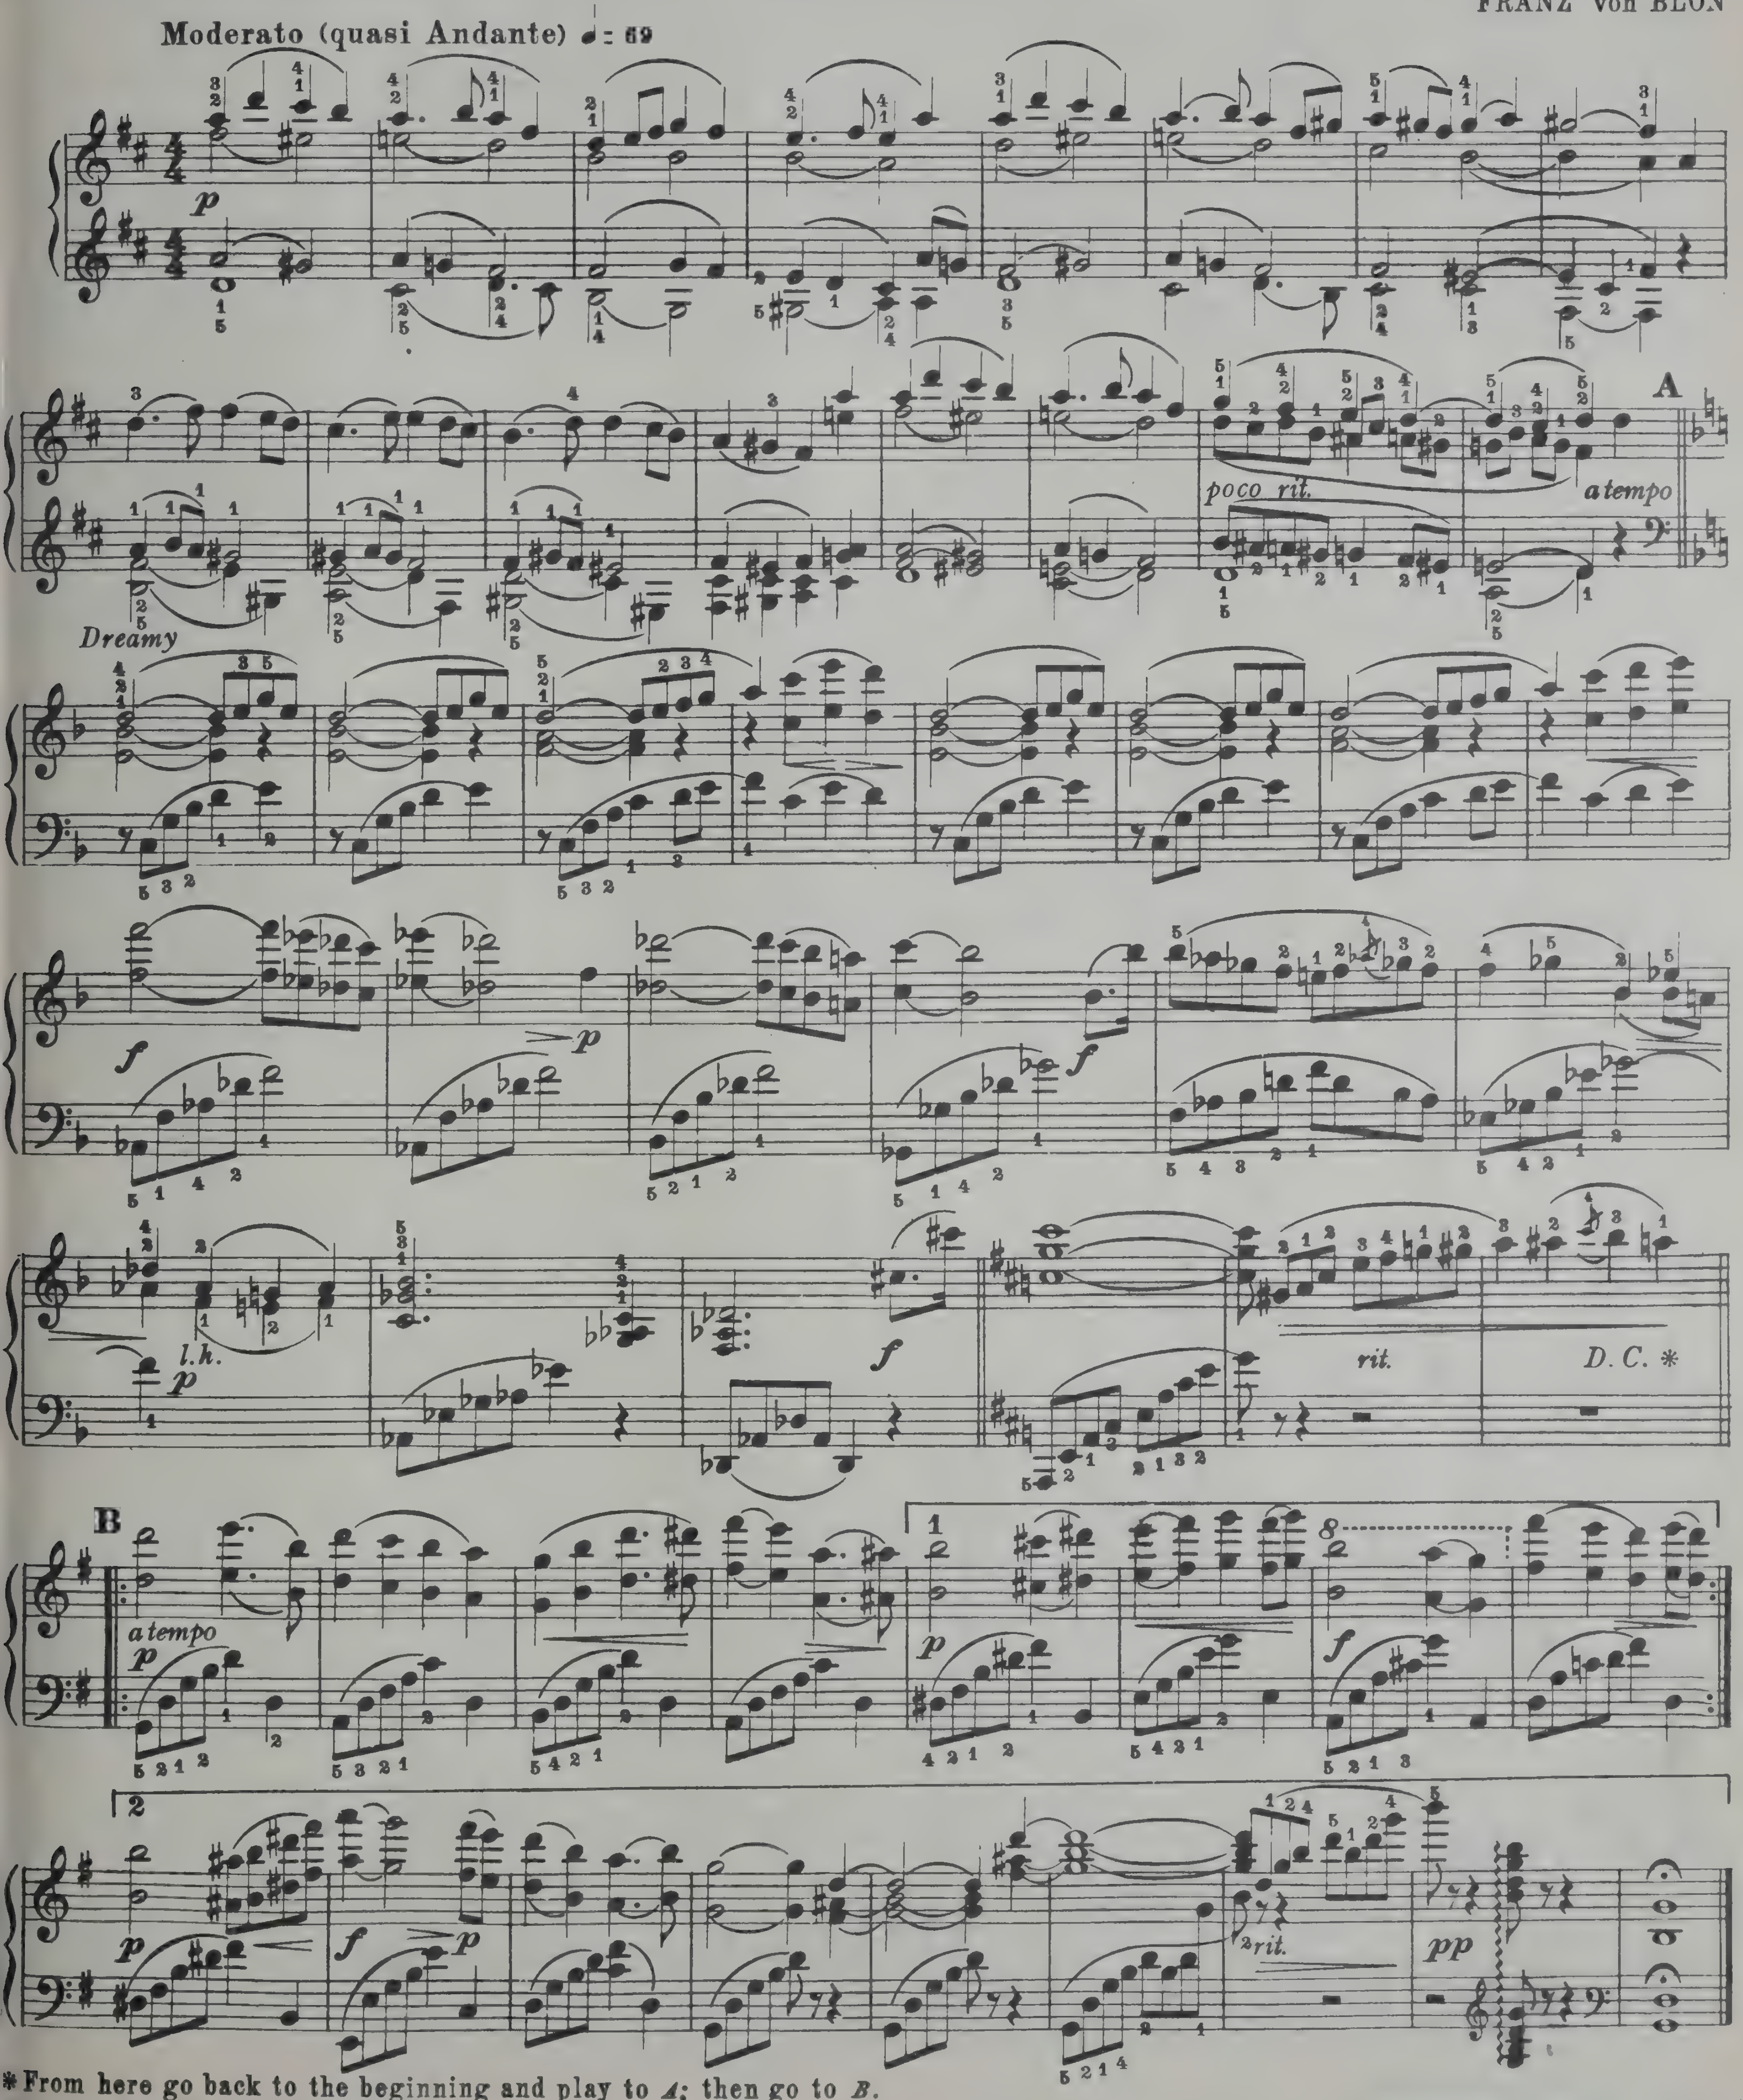
One understands the surprise of the symphonists. They must have wondered if the redoubtable battler had his eye on the piano and perhaps intended to demonstrate his striking powers by "hitting the ivories." Or possibly his experience of the afternoon made him cast longing eyes on the tympani. Maybe they thought the champion of the prize-ring had received vague information concerning the Wagnerian "Ring" and wished to arrange a fight with *Siegfried,* the Tarnhelm Kid who "K. O'd" *Wotan* in a memorable battle.

But no; the champion's visit was purely an act of courtesy as between one professional entertainer and another. Reciprocity seems in order. One of our leading symphony conductors might return the visit by appearing in "the squared circle" to be introduced to the fight-fans as one of the world's contenders for the time-beating championship.

IN REMEMBRANCE

Very smooth and flowing, in the style of an organ piece. Grade 3½.

FRANZ von BLON



---

* From here go back to the beginning and play to A; then go to B.

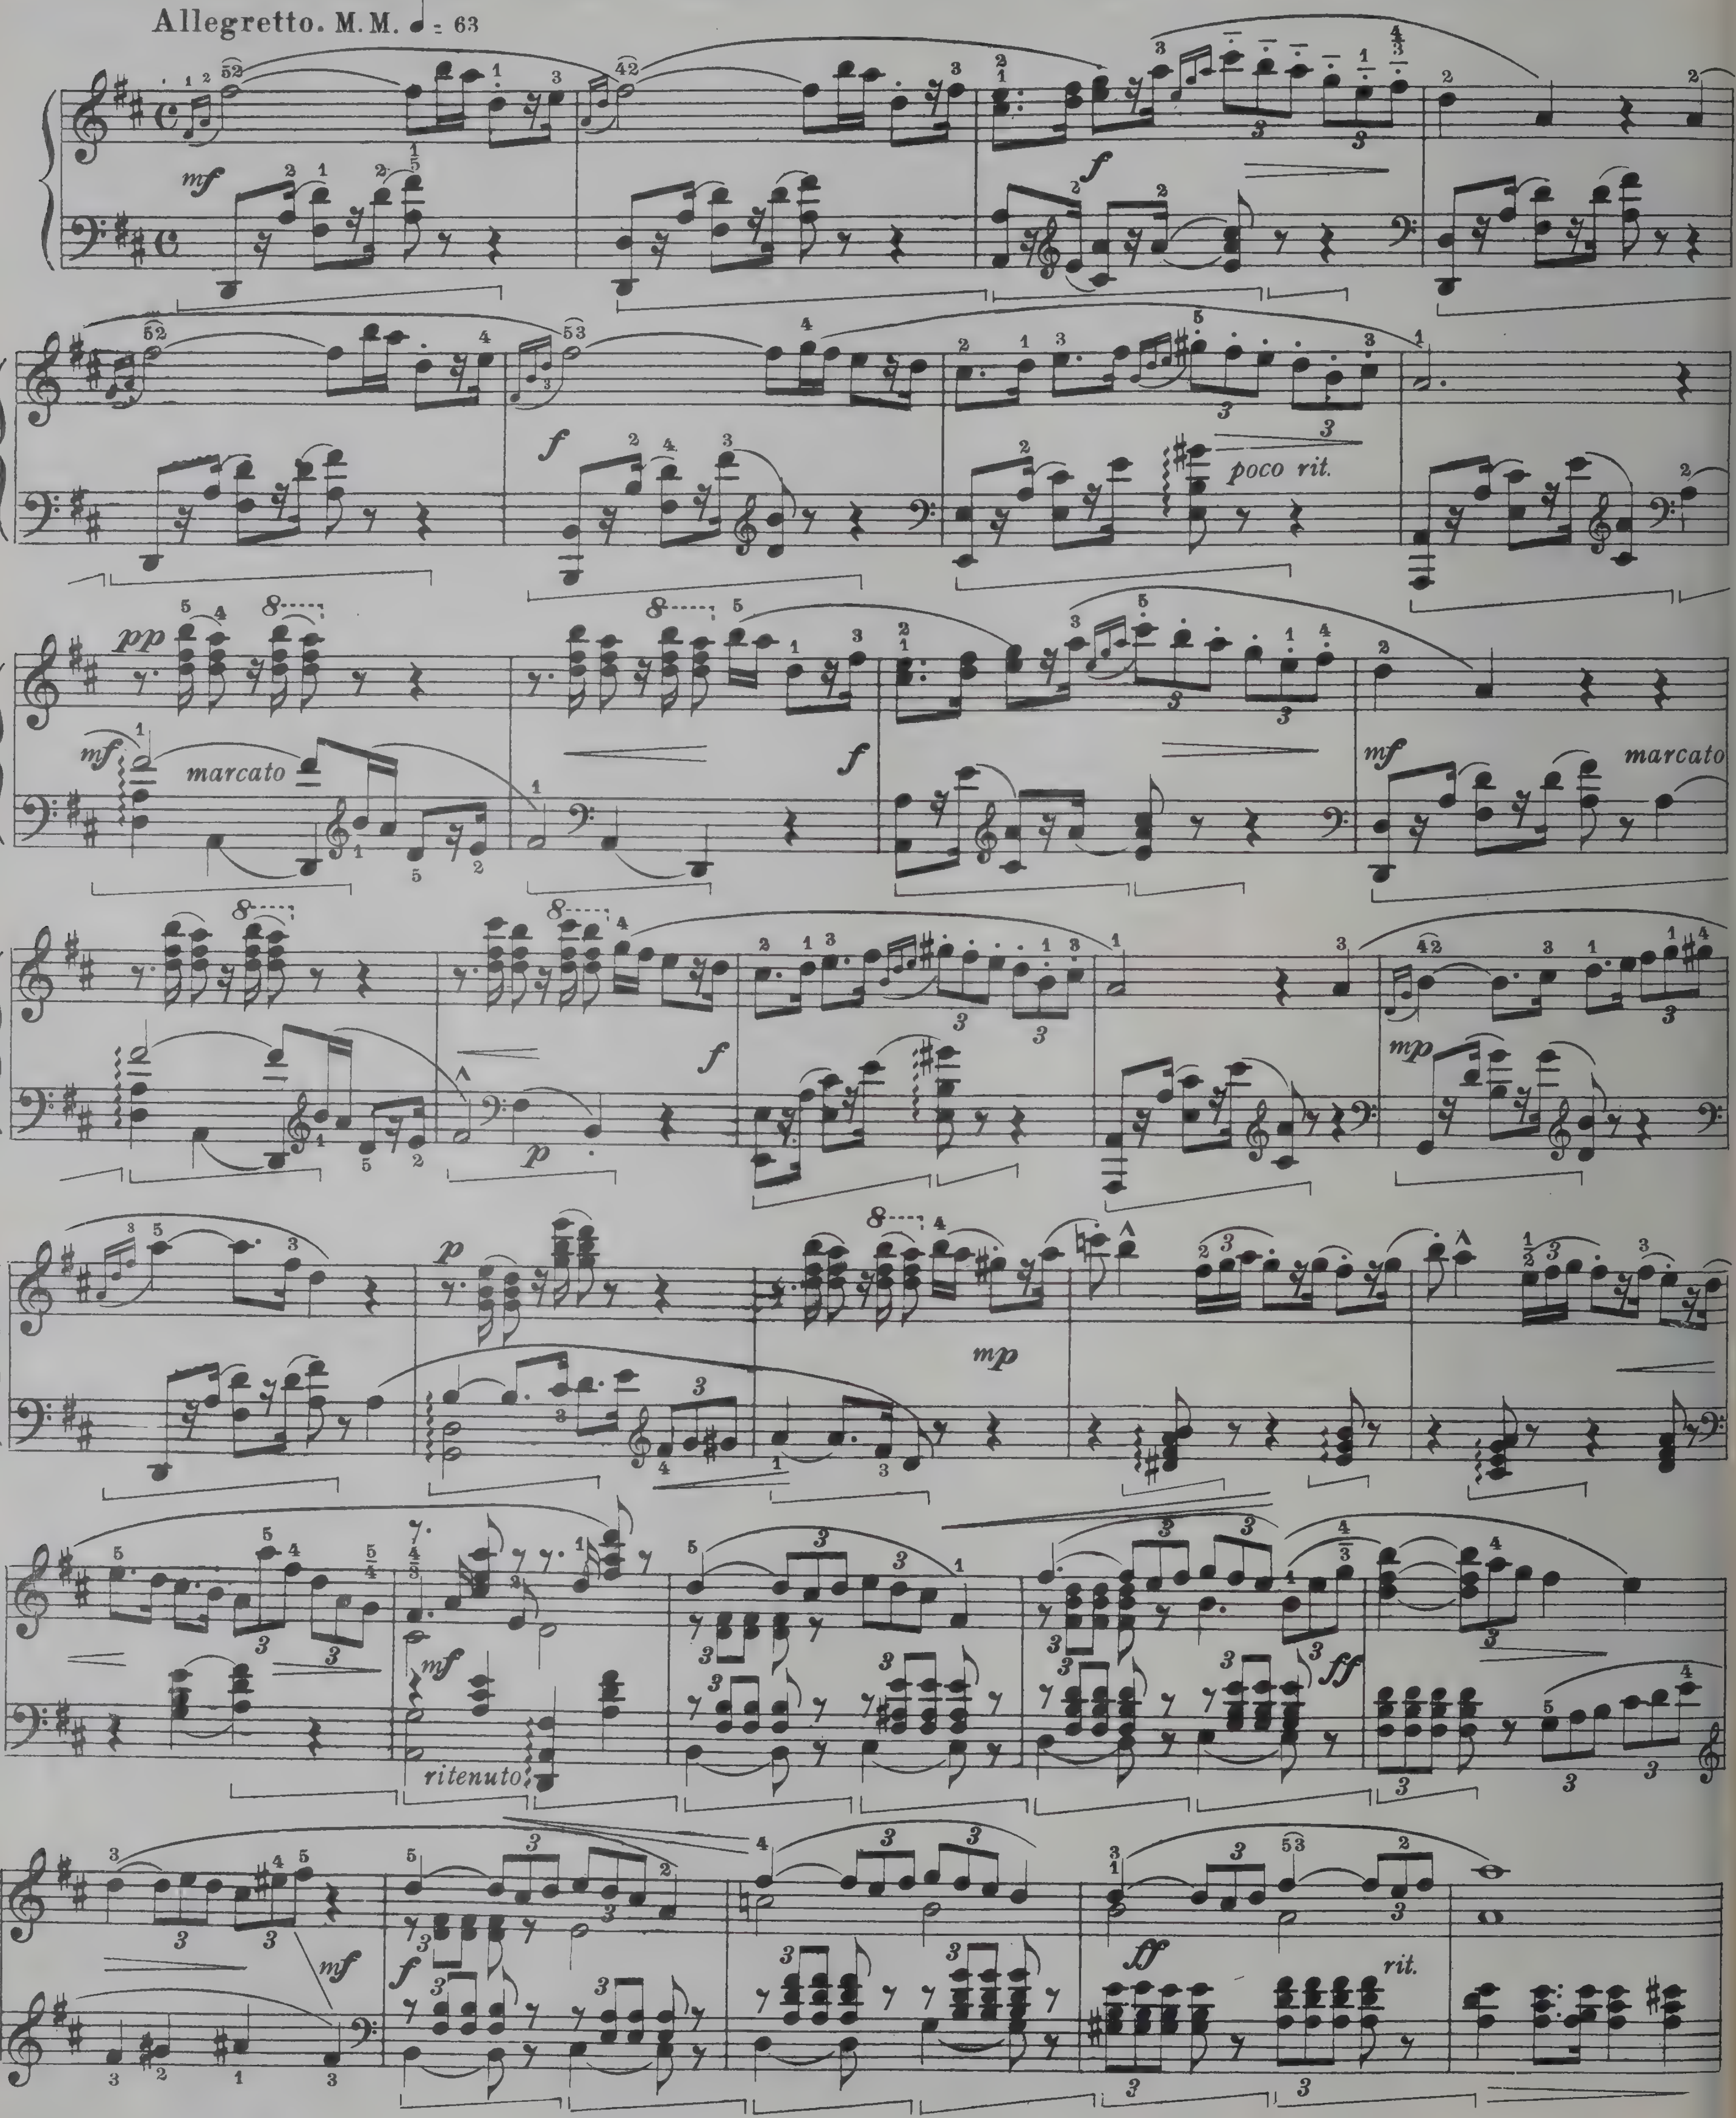
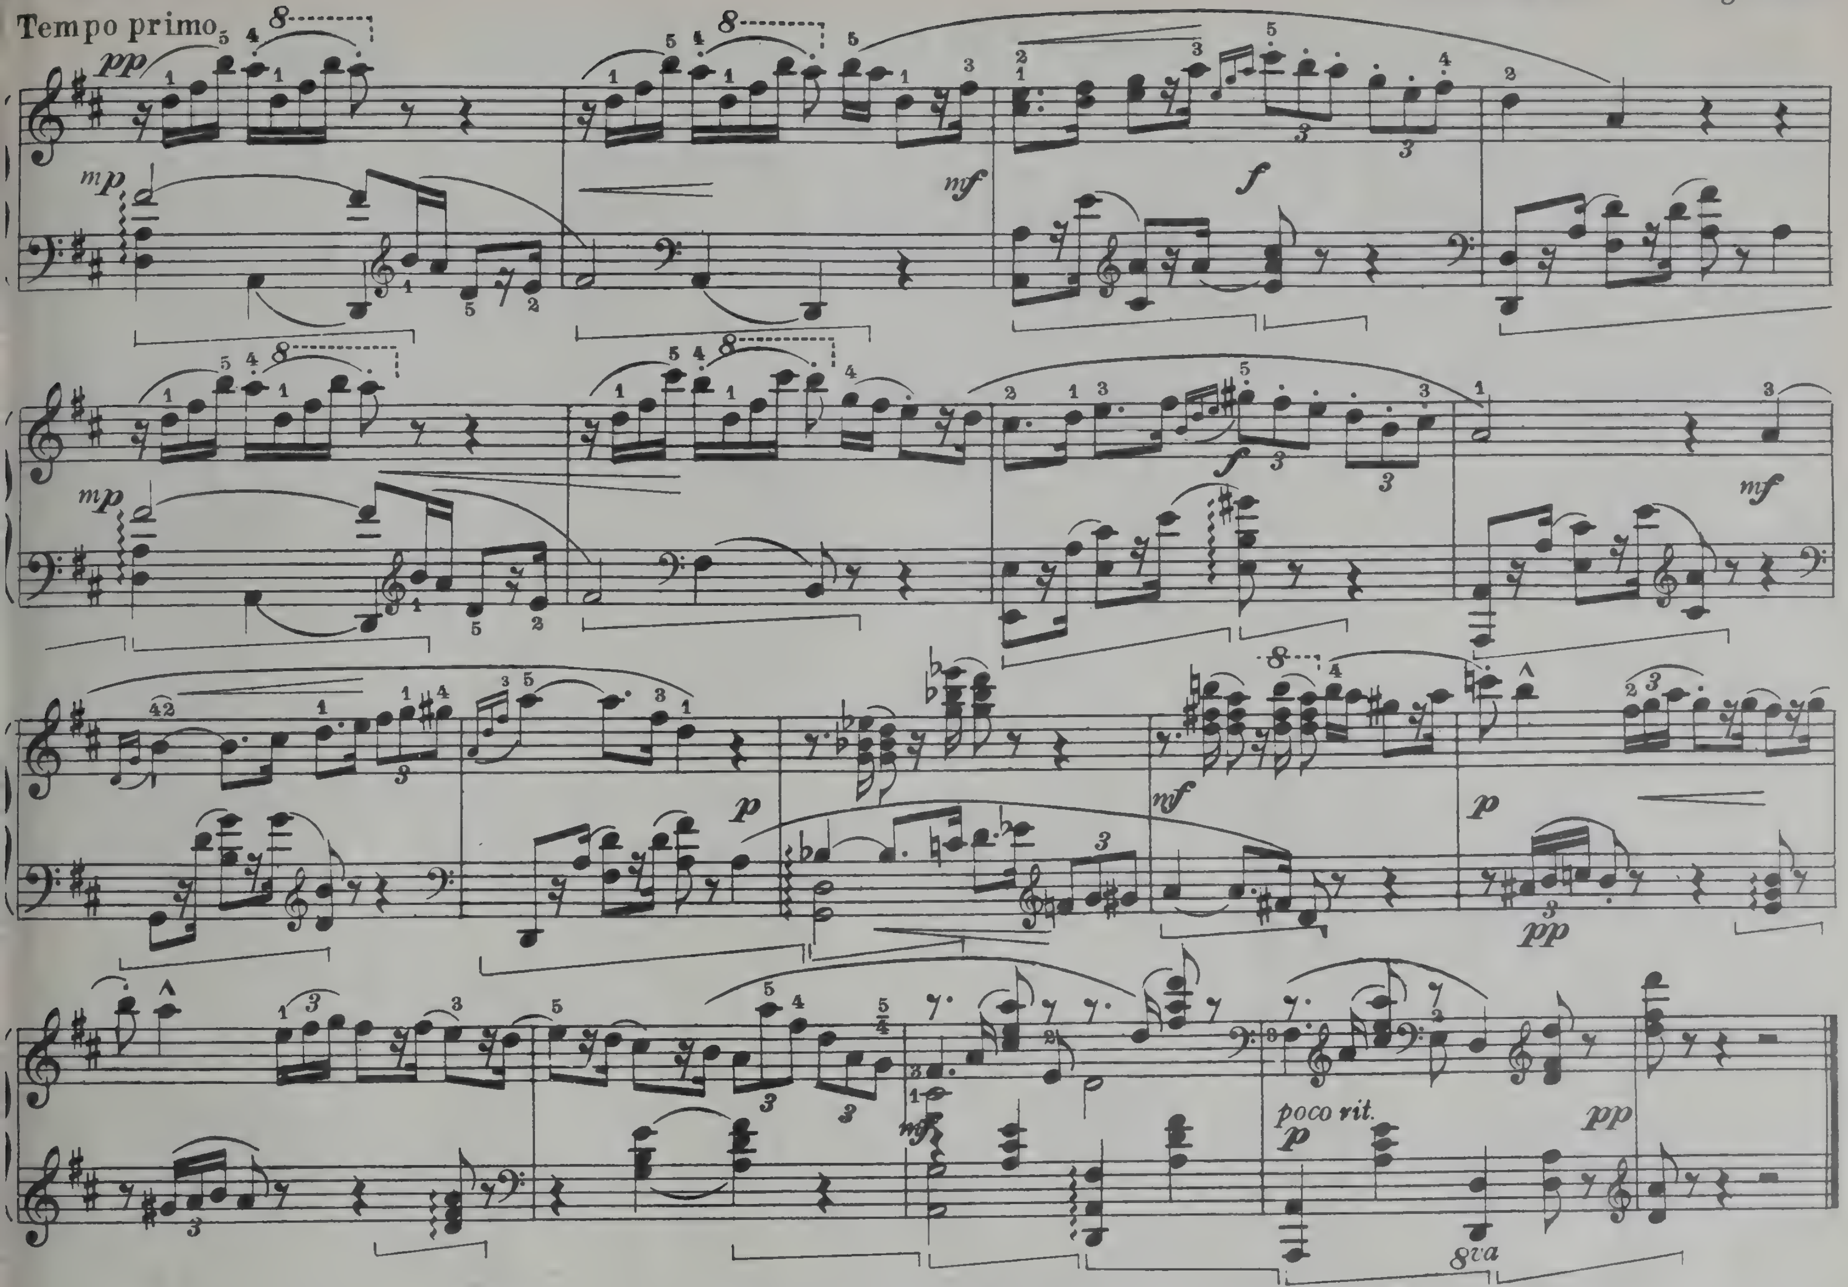
CANZONETTA

GEORG EGGELING, Op. 209

A very pleasing composition exemplifying the carrying out of the melody in several voices. The ornate accompaniment must be steady but subdued. Grade 4



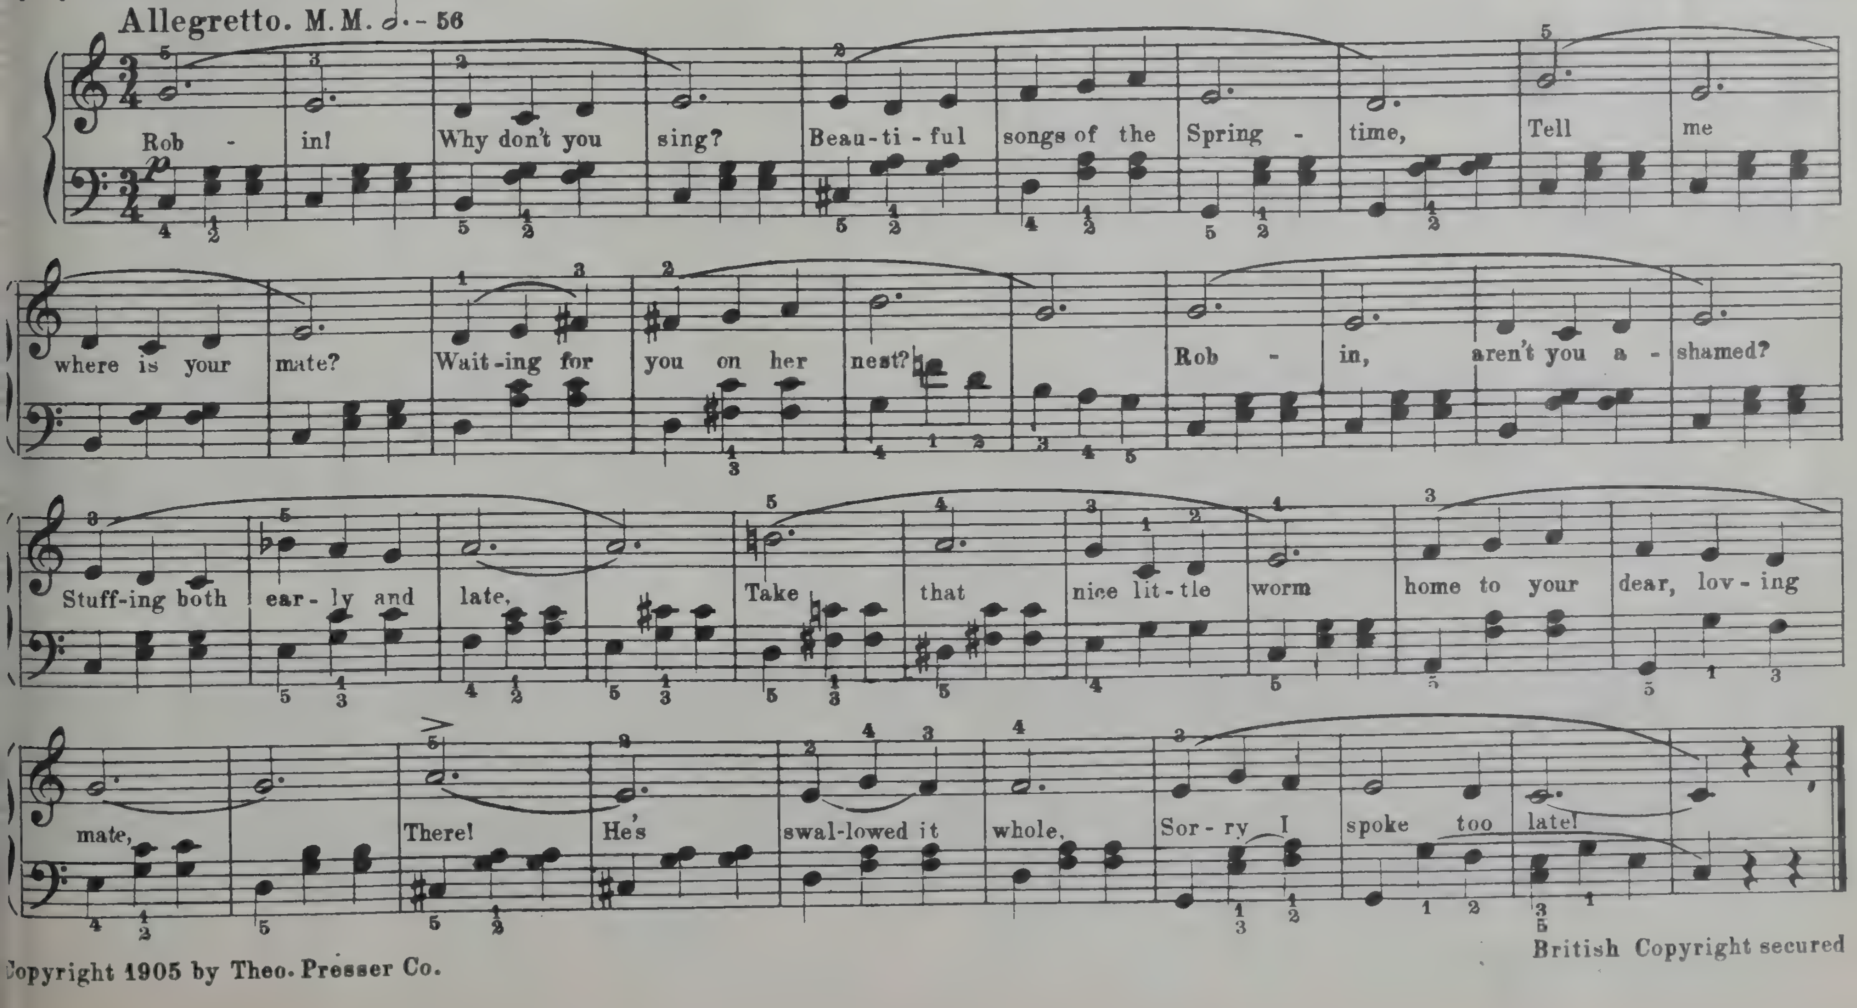
Copyright 1924 by Theo. Presser Co.



THE ROBIN

jolly little beginner's piece. Grade 1

R. E. DE REEF



Allegretto. M.M. 𝅗𝅥. = 56
p
Robin! Why don't you sing?
Beautiful songs of the Springtime,
Tell me where is your mate?
Waiting for you on her nest?
Robin, aren't you ashamed?
Stuffing both early and late,
Take that nice little worm
home to your dear, loving mate,
There! He's swallowed it whole,
Sorry I spoke too late!

Cardinals of Study

By Sarah Elizabeth Spratt

MEMORY has four powers, as follows:
Recognition.
Localization.
Reproduction.
Retention.

It is very important that the music student cultivate a logical memory, or the power to reason correctly; to know things by their relations. If you think of something—no matter what—you are sure to find yourself thinking the moment after of something connected with it. But the majority of music students are apt to depend on a merely mechanical or muscular memory, induced by constant repetition. Mechanical memorizing is an irksome task at best, whereas, to associate ideas logically is delightful.

The first steps in logical memorizing should be done away from the piano, or whatever musical instrument is used. Take your study or piece to some quiet place and thoroughly analyze it. To accomplish this, every music pupil should have some knowledge of harmony and sight singing. If a teacher cannot be procured, then get Orem's harmony for beginners. By diligent application any pupil may get a very good understanding of the principles.

How to Analyze

Number your measures 1, 2, 3 and so on, to the end. Then study out the essentials of every measure: (1) melody, (2) rhythm, (3) harmony.

1. First confine yourself to accurate note reading; discover all the new keys, whether major or minor; mark all the diminished or augmented chords; note all the modulations into diatonic, chromatic or enharmonic progressions. Study out the fingering carefully, so that there will be no broken phrases. If you wish to have speed, strength, accuracy, finish and position, then *do not neglect fingering.*
2. Get a clear idea of the rhythm by dividing the musical sentences or phrases into regular metrical portions. Keep the essential rhythm in mind, and the recurrence of accents at equal intervals of time. Note the principal themes, cadences and general structure.
3. Now go over the composition again, and strive to see the relation of the complex group of facts. This will bring into use two of memory's powers—recognition and localization.
4. Expression can be best attained at whatever instrument is used.

Expression is not merely crescendo, decrescendo, rallentando, accelerando, rubato or ritard. Any genuine musician will tell you that expression is intuition, emotion and conscientiousness. Do not get into the habit of playing expression marks as unfeelingly as you control the power in your motor car.

Every music student should have high ideals, so that he will make something fine and noble of his music.

5. Pedaling should not be taken up until other difficulties are mastered. Slovenly habits regarding the pedal will not be tolerated by any good teacher, nor will any pupil ever progress far into the musical world who totally disregards or misuses the pedal.

When you have mastered all the difficulties of your piece, which may take weeks, or even months, then you will have brought into use two more of memory's powers: retention and reproduction.

Opportunity

By Gabriel Hines

You have as much opportunity as the other fellow. Make use of it! Hold on, else it might slip from you! What is the trouble? You say you have no luck? You have failed in all your attempts? How do you know? If you keep on trying you will surely get somewhere. Failure comes only from cessation of work. Besides having a mentality, you have hands, eyes, ears, a tongue and a physical machine. Do you know the value of these? Use them.

You can hear far greater music than Beethoven heard in his day.

You can have a piano superior to the one on which Liszt played.

You can read the same music Paderewski reads.

You can hear the same operas, symphonies and recitals as Richard Strauss.

You can surely obtain a pen, and as much ink and manuscript paper as Puccini ever used.

You have the same free right to express yourself as Debussy had.

You have the same number of working hours as Rachmaninoff.

Their opportunities are your opportunities.

You are barred from nothing, there are no restrictions put upon you. Why, then, do you not make good? Why not fill that vacant space on top? There is always room for the right man.

Every publisher is looking for the right sort of music. Supply it.

Every music school is in want of a good teacher. Go to it.

The music world demands new and better music every day. Do it!

There are plenty of opportunities knocking at your door. You have no cause for complaint. If you fail, try on, and on, and on. If you do not try it is because you are lazy; and lazy people have no one to blame but themselves.

Get out, hike, build, create, compose, do something.

Children want teachers, theaters need musicians, churches demand good singers, the neighborhoods cry for more organ grinders. Have your choice.

Value your time; always keep cheerful; do not depend upon others for help. Be prepared to meet any and every occasion; then you will find there are more opportunities awaiting you than you had ever dreamed of.

The Musical Harvest

Countless ETUDE readers have written us of the benefits they have received from ideas secured through this publication.

Countless teachers owe much of their success to THE ETUDE. One teacher wrote us that she considered each subscription sent in from her pupils as seed planted in preparation for a harvest. Why not prepare for a similar harvest among your pupils? Subscriptions may be entered at any time.

The Famous Nestle "LANOIL" Home Outfit for Permanent Waving Enters Royal Palaces of Europe

Dainty Apparatus Safely Transforms Lankiest Hair Into Beautiful Permanent Waves and Curls. Price Only $15

Water Makes LANOIL Waves Curlier

"MARGARET's bob was absolutely stiff and straight before," writes MRS. NELLIE LEWIS, R. F. D. No. 2, Astoria, Ore. "But since I waved it, she can curl it prettily any time over her finger with a little water."

The Nestle LANOIL Home Outfit in use. The picture below shows two friends waving each other's hair in their home.

"My LANOIL Waves and Curls Are a Source of Pure Joy," writes MISS WANDA NITA KENNEDY, Paden City, W. Va., "nor does this picture show nearly all their beauty."

WHILE in two years this wonderful invention of the eminent New York hair genius, Mr. C. Nestle, has gone to *over 200,000 AMERICAN homes*, and waved close to one million women and girls *here* with sensational success, its popularity has been spreading to every country in the world, and testimonials have arrived from England, Italy, France, Greece, and even from an Egyptian Princess 4,000 miles away!

Two Sisters Use Outfit with Great Success

MISS BETTY AMMARELL, 9014 10th St., Richmond Hill, L. I., writes: "Sister waved my hair and I waved hers. We are sending you our pictures taken several months after the waving. We are delighted."

LANOIL Waves Withstand Perspiration, Shampoos, Etc.

When glossy, healthy, natural permanent waves and curls can be yours so easily, why do *you* continue struggling daily with your straight, unruly hair? Even if you cannot go to Nestle's magnificent establishments in New York, where over 200 women of fashion are waved daily, even if you cannot visit a professional Nestle LANOIL waver elsewhere, you *can*, in the privacy of your *own* home, make your lankiest, dullest hair so naturally curly that water, shampoos, fog, bathing, or perspiration will only make it curlier and wavier.

Safe and Pleasant

Quickly, safely, comfortably, a single application of the Home Outfit will give you permanent, silky-bright, natural curls and waves. No more nightly kids, curling tongs, or fluids. The same outfit will do for mother, sisters, children, for friends and neighbors, and little girls of four are waved with it in *perfect comfort.*

MOTHERS

seeking counsel how to help their babies *grow* naturally curly hair are invited to write or send the coupon for Mr. Nestle's free booklet.

Waved 3 Months Before This Photo

"I have shampooed my hair twice since waving it, and it looks prettier and curlier each time," writes MISS LURENA A. SMITH, 69 School St., Bradford, Pa.

Our fully illustrated explanatory booklet sent free on request

Home Outfit is Sent Anywhere on 30 Days' Free Trial

The best of it is that it costs you nothing to try it! You may, of course, have our free explanatory booklet first, containing dozens of additional photographs and letters from our delighted customers. But this means delay—so why not send directly for the Outfit on 30 days' free trial? Convince *yourself* now by using it in your own home. We will send it to you with free trial materials. Wave your hair, following the simple directions. Then wait. Wash, brush, comb, test it in any way you see fit. If your lovely, soft curls and waves do not look and act exactly like naturally curly hair through every test, if they do not become prettier every day, no explanations are necessary. Just return the Outfit, and every cent of its cost of $15, deposited with us, or with your postman, will be refunded immediately.

Remember, *one* application will give you charming, naturally curly hair for ALL THE TIME. Send the coupon or a letter or a postal immediately to have your Home Outfit sent you *on free trial at once.*

NESTLE LANOIL CO., LTD., Dept. E
ESTABLISHED 1905

The Singer's Etude

Edited by Vocal Experts

It is the Ambition of THE ETUDE to Make This Voice Department "A Vocalist's Magazine Complete in Itself"

Standarizing Voice Teaching

By D. A. Clippinger

THIS old world is pretty much of one opinion on the proposition that things are going rather badly. On everything else we disagree, but on this we are practically unanimous. Dissatisfaction reigns. Chaos is in the saddle. If we believe the newspapers we must conclude that the world is committed to a life of crime. Little is done that wins public approval. The public press is training us to look for evil, inefficiency, and ignorance, and quite naturally we see what we are looking for.

When one comes forward with a new idea he is set upon, harrassed, abused, discredited, until he is sorry the idea came to him. The world has on numerous occasions demonstrated its complete incapacity to recognize truth when it sees it. Witness every musical genius and every real reformer, political and religious.

But notwithstanding all of this there is in the human mind a mighty urge to improve conditions. No one feels equal to the task alone; so combinations, educational, political, artistic, are formed. "Get together" is the cry and a general uplift is the aim.

Maximum Production

In this scheme of scholastic improvement there is a somewhat concerted effort to induce all people to do the same thing in the same way, to standardize teaching, to formulate educational procedure and all use the same formula. In things mechanical this can be done. Where quantity production is the chief aim it is eminently proper. Maximum production with minimum cost demands it. In the manufacture of automobiles, for example, a standard, or model is established and thereafter every car is an exact reproduction of the model.

It will be noted that so long as a particular model is used there is no improvement in the product, and will not be until the model is improved.

In recent years standardization of voice teaching has troubled the waters not a little.

There is a feeling that voice teachers should get together and agree on a system and all use it. Here we leave, or should at least, the field of mechanics and enter one where individuality is constant and persistent. It is a factor which cannot be eliminated or side-tracked, but must be reckoned with continually. I am inclined to believe that this phase of the subject has not received sufficient concentrated thought.

In standardizing voice teaching the first step is to establish a standard. The second step is to induce all voice teachers to use it. Evidently there are some who are laboring under a misapprehension of what this means.

Frequently one goes on record in favor of standardizing tone quality. Another one is in favor of standardizing tone production. Therefore the question: shall we standardize tone quality and let each one get it the best way he can, or shall we standardize a method of production and each one follow it regardless of results? Or, shall we standardize both tone quality and production? I apprehend certain staggering difficulties in each of these propositions.

The Tone

Those who favor standardizing tone quality should give the matter serious thought before insisting too strongly upon it. Consider this for a moment. If we undertake to standardize tone quality this will not be accomplished until we make up a certain tone complex, agree upon it and get its mathematical formula. It would consist of a fundamental with such and such overtones combined in such and such degrees of prominence to give it just the kind, quality, and amount of resonance which we agree it should have.

But first of all some one must sing this tone. It cannot be produced by any mechanical instrument. The standard tone must first be sung and agreed upon, then its scientific analysis made. Who shall sing it? What is a perfect tone? Who shall decide?

The selection of a standard tone quality would involve that intangible but definite thing called *taste*, which among singers and singing teachers is as various and variegated as the face of nature. Each one has his own standard and it would soon be learned that a standard tone is eternally and unalterably individual.

Each one has his ideal tone, and it is not something he buys at the music store. It is a tone that harmonizes with his taste, that satisfies his mental demand; and this mental demand is the result not only of the kind, quality and amount of his vocal training, but also of his environment, his general education and culture, together with that of his ancestors for no one knows how many generations. The queer thing about musical taste is that it always seems right to its possessor, no matter how unformed and imperfect it may be, for the very good reason that he knows nothing better.

Endless Standards

Does anyone presume that all teachers of singing are equally good musicians, equally developed, have equally good taste, equally good voices, sing equally well, have equally fine sensibilities, have equally fine gifts for imparting knowledge? And yet everyone has a standard which seems good to him and with which he is trying to measure up, and which he will not abandon without a struggle. He must be convinced that there is something better before he will destroy his idol; and this is no small task. Therefore, in selecting a standard for tone quality we should have to reckon with as many standards as there are teachers. It would be another example of an irresistible force coming in contact with an immovable body, and the result an eternal deadlock.

Everyone knows what he likes; no one is in doubt. It is this state of mind that has produced over one hundred millions of music critics in America. It is this that would stand in the way of a standard tone, which, if it could be established, would be the most disastrous, calamitous thing that has occurred in the history of the world. A volume could be written upon it.

If two hundred voice teachers were together there would be two hundred musical mentalities in different stages of development. There would be two hundred ideal tones, two hundred standards, and the probabilities of an agreement would be just one in two hundred.

But suppose, by way of argument, that some one of the number produced a tone which all agreed should be the standard. What would be the next step? A tone cannot be put on paper; therefore, in order to be able to teach it, each one must learn to produce that particular tone quality so accurately that it could be told from the original. Is there anyone so credulous, so optimistic, with such extraordinary mental appointments, as to believe such a thing possible?

Nature never produced two voices nor two vocal instruments alike. This is true, not only of tone qualities, but also of thyroid cartilages, vocal cords, vocal cavities. The construction of the vocal instrument determines its ultimate possibilities, and good construction is as essential to voices as to pianos. To standardize the human larynx, the length and thickness of the vocal cords, the shape and size of pharynx, mouth and head cavities, the things which have so much to do with forming the natural quality of the voice, is, to say the least, not easy.

The Instrument Itself

Further, it is the construction of the vocal instrument that determines whether the voice shall be soprano, alto, tenor, baritone or bass, with the endless variety these classifications include.

But the plot thickens. It is now evident that we must have a standard tone quality for each of these five voices. This multiplies the difficulty by five, to say nothing of lyric and dramatic sopranos, lyric and dramatic tenors, and so on. In view of all this we are forced to the conclusion that before a standard tone can be established it will be necessary to standardize the human race, a proposition bristling with difficulties. It is not at all likely that voice teachers of the country will ever hold a meeting for the sole and distinct purpose of standardizing the singing tone. They are far too smart to do such a thing; but if they should, it would be the most interesting meetings ever held, in more ways than one. Who would want to listen to one kind of a voice for the rest of his days? The thought of it is deadening!

I am convinced that those who are clamoring for a standard tone are confused and do not really mean what they say. Nothing could be less desirable.

Standardizing Production

But the difficulty of selecting a standard tone is nothing compared with standardizing a method of producing it. If we could agree on a certain list of exercises, a thing which by no possible stretch of the imagination ever could be done, would we not be getting dangerously near to the one-formula method? Fancy every teacher having an official list with such directions as:

For vowels use No. 1.
For resonance use No. 2.
For power use No. 3.
For placing the tone in the head No. 4.

Please remember that no system which does not permit the teacher to put the tone somewhere, preferably some part of the head, could ever receive a majority of votes.

Then there would have to be a particular exercise for developing emotional tone; another for forming the head voice; another for developing the imagination; and so forth. Lord pity us! There is far too much of this kind of teaching done already. I understand that the method of teaching which puts every pupil through the same list of exercises in the same order, regardless of their condition and previous experience, is one thing the standardizers are anxious to change. Then have a care when you talk about getting together. The one-formula method merely undertakes to make the pupil a copy of someone else and destroys his individuality, his most valuable possession. Anyone who does this is not only grossly ignorant of the meaning of teaching, but also is getting uncomfortably close to criminal practice.

Standardization is an unfortunate word. As I have heard the matter discussed at various times and places, it always implies getting together and doing things in the same way. In a matter so completely individual as voice training, nothing could be more unfortunate than a one way of doing it. But is it at all likely that the thousands of voice teachers in the country, ranging from those who know little or nothing about the voice to those of great natural gifts and high attainments, will ever all treat a voice in the same way? Each one teaches as well as he knows how; and he will not teach better until he knows better. If we use the slogan, "Raise the standard," then we have started something in which all can join with enthusiasm.

There are no two teachers whose mental processes are the same. There are no two pupils whose mental processes are the same. Therefore no two teachers, though they may be equally proficient, will teach alike; and no two students can ever be taught exactly alike. Their mental processes, their way of approaching a subject and their voices are different. Does any teacher proceed in the same way with his most gifted pupil and his slowest one? Not if he knows even the rudiments of his business.

The wise teacher studies his pupil, learns whether his gifts are large or small, whether his mind acts quickly or slowly, discovers what his immediate needs are, and adjusts his teaching accordingly. In working out the same problem with different pupils one cannot always use the same exercises or apply an exercise in the same way.

What a deadly, terrifying business teaching would be if we had to use the same exercises in the same way and try to make them produce the same kind of tone. But such a thing will never happen. No teacher worthy of the name will ever reduce himself to a mere imitative automaton.

I am in complete agreement with all those who believe that the standard of voice teaching should be raised; but I am also in complete disagreement with those who would try to make all teachers teach in the same way. This would not raise the standard. On the contrary, it would lower it immeasurably. Raising the standard is an individual matter, and every honest teacher strives daily to raise the standard of his work; but to believe that the dullest and the most gifted will ever have much in common in their teaching reveals a state of mind that is doomed to disappointment.

Real Standardization Impossible

That which makes it impossible ever to achieve anything approaching mass standardization is that every year furnishes a crop of young teachers who enter the ranks with those who have been at it twenty-five years. They cannot possibly have the same grasp of the subject as those of large experience. It is psychologically impossible. Each one sees to the limit of his experience and no farther. There are many things the young teacher thinks he understands which ten years later he will see that he did not understand at all.

But who is it that needs to raise his standard? There are some who are teaching about as well as is humanly possible and who may be safely trusted to look after their own standards. Therefore we need not think much about those at the head of the column, but about those lower down; and here we come to the matter which, above all others, needs most attention: the preparation necessary to make one a safe and reliable teacher of singing.

The teacher giving his first voice lesson is called upon to form and express musical judgments. There are at least a dozen things upon which he must sit in judgment when he hears the first tone. Is it too loud, too soft, too thick, too thin, too bright, too somber, is it resonant, is it breathy, is it true to pitch, is it flat or sharp, is it free, is it throaty, is the mechanism right, is it steady, has it the right breath support? to ask but a few of the more obvious questions. These and many other things must pass in hasty review and be judged at once. The nature of these decisions begins at once to determine the teacher's value. They demand a thoroughly trained ear, a refined sense of tone quality and musicianship. Most of the vocal wreckage strewn along the way is due to the lack of a discriminating ear on the part of the teacher. Judging from what one hears, it would seem that the most difficult thing for many to learn is when a tone is free. When singers, year after year, continue to sing a thick, unsteady, throaty tone, without offending their ear or that of their teacher, we must conclude that there is a serious defect in their tone concept. If it could be brought about that before beginning to teach everyone should have an ear keenly sensitive to interference in tone production and how to rid the voice of it, that one achievement would raise the standard of voice teaching at least one hundred per cent. All teachers of experience know that when the voice is free from all interference there is no further difficulty in forming it.

The nature of the vocal instrument is such that it will produce a wide variety of tone qualities, from the best to the worst. Voices present themselves to the teacher with all manner and degree of bad habits of tone production. He is confronted with the problem of making them all produce pure, sympathetic, musical tones, and he cannot go beyond his own ideal, which is the product of his experience. The teacher who has a refined sense of tone quality, and can teach his pupil to produce his tone with perfect freedom, puts him on a safe highway. Such an ear is the most valuable asset any voice teacher can possess; for all else that he may know is of little value without it.

Singing teachers should impress upon those of their pupils who expect to enter the profession of teaching, the wisdom of thorough preparation, not only in knowledge of the voice, but also in musicianship. Those who begin teaching before they are prepared pass their imperfections along to others, and thus begins an endless chain.

I believe with the American Academy of Teachers of Singing that as a preparation for voice teaching one should have at least five years of study with competent teachers, and add to this sound musicianship, a working knowledge of theory and a correct use of the English language, and I would add, as much knowledge as possible of piano playing.

Raising the standard is an individual problem. Like working out one's own salvation it cannot be done suddenly; but there can be no doubt that the chief concern in standardization is to have the standard as high as possible in the beginning.

There are over thirty railroads entering Chicago from all directions, but they all reach the heart of the city. In this matter of standardization it is neither possible, desirable, nor necessary for all to work in precisely the same way; but there are certain principles underlying the correct use of the voice which all may and should understand. Such qualities as freedom, sympathy, power, automatic responsiveness, if understood and mastered, will lead the pupil to the pure singing tone even though not always approached in the same way. The more clearly these principles are understood and the more sensitive the ears of teachers become to what is pure and beautiful in tone quality and expression, the higher will be the standard. This is the only standardization desirable or possible.

Suggestion in Voice Training

By J. Louis Orton

Voice culture is not merely the outcome of common sense, though many believe it to be so; it is the result of experiment and experience, spreading over many centuries. Much of the early experimentation doubtless had disastrous consequences; and though by degrees a high level of mechanical and artistic excellence was attained, when the old Italian school was at its zenith Jean Jacques Rousseau could justly state in his "Dictionnaire de Musique": "On a fait un art du chant; mais il reste bien de decouvertes à faire sur la manière la plus facile, la plus courte, la plus sûr d'acquerir cet art."

Since the time of Rousseau there has been some retrogression in vocal culture owing to the incursion into the voice-culturists' domain of persons ill-equipped to form correct judgment on the various questions at issue. But there has also been some progress. A wider knowledge of vocal physiology has considerably shortened the time indispensable to the mastery of certain portions of the singer's art. It is all very well, however, to know what the physiological conditions of ideal voice are, and a widely different one to insure those conditions being complied with by pupils.

In other words, sufficient attention is rarely given in voice culture to the psychic element. An excellent illustration of this fact is afforded by the experience of the celebrated American soprano, Miss Mary Garden. Taking the chair at a meeting in the United States of America tour of M. Emile Coué, she admitted that one month's utilization of methodical suggestion had improved the quality and increased the compass of her voice to a remarkable extent. That clearly shows that a singer may attain to great fame and yet be using far from all of his or her potential ability. Though methodical suggestion does not supply technical knowledge, it can assist one to make the best use of what one does know. It can insure in most cases the acquisition of the right mental condition and attitude. It can supply qualities needful for success, for example, "concentration, "self-confidence" and "perseverance."

Such an application of psychics is no new thing. James Braid, the medical man who coined the word "hypnotism" (which, by the way, he afterwards attempted to suppress as misleading), about eighty years ago, employed psychics in connection with voice, and since his day Dr.

Quackenbos (a professor at Columbia University), Dr. Osgood Mason and others have done so with more insight regarding ultimate results of their work. Nevertheless, the experimenters referred to all lacked a specialized knowledge of voice culture, and consequently their labors in this connection were one-sided. The first professor of vocal culture to employ psychics widely in his art seems to have been myself. My investigations and practice have spread over close upon a quarter of a century. In my work entitled "Rational Hypnotism," published in April, 1914, I endeavored to sweep away the mystery and humbug which have enveloped the subject and to place the residue upon a sound foundation. I also dealt with many practical applications of the matter, for example, musical education, voice culture, public speaking, the cure of speech defects, and so on. I am pleased to add that *Musical Opinion* was one of those magazines which boldly took up the theme, recommending the work and the aids advocated therein to the notice of all open-minded musicians.

From the practical standpoint my endeavors had been as highly gratifying to the many hitherto partially-thwarted vocalists and others who sought my aid, as to myself. Then came the great war, and consequently a serious interruption of my labors in this direction. Whilst, however, I was "doing my bit," the medical aspect of psychics came into prominence, mainly through the needs of "shell shock" cases. Since then a further fillip has been given by the visits and demonstrations of M. Emile Coué, and one foresees that the day is coming apace when what was long looked upon with suspicion and even ridicule will take its place in the educational as well as in the medical curriculum.

No one other than a quack would contend that wide technical knowledge of voice can possibly be dispensed with in the equipment of whoever aspires to vocal excellence, and I trust that my name may never be associated with any such contention. What M. Coué and I maintain is that in ordinary instruction, of children and adults alike, there is a great tendency to "put the cart before the horse." A proverb of the Jesuits runs: "What you wish to do quickly, set about slowly." It is an equally good rule in art and in policy. "Divide to conquer." Education that ignores the training and utilization of the power of adroit, agile, comprehensive thought, of the meditative condition, and of "unconscious" brain work is not merely lacking, *it rests upon a false basis.*

Dr. Floyd Muckey quotes the advice of another eminent medical man to the members of his profession, collectively, somewhat as follows: "Gentlemen, do not let us be hypnotists instead of doctors, but *let us be prepared to employ* hypnotism where it is likely to be serviceable." Braid, though he widely employed so-called "hypnotism" with patients, objected to being called "a hypnotist," protesting that he was no more a hypnotist than a castor oil doctor. Surely members of other professions may well take a hint from the medical men referred to.

"Why," asked Erasmus, "do you tell me of the generality of people, the very worst pattern of conduct? Why do you talk to me of custom, the teacher of all that is bad? Let us accustom ourselves to that which we know is best; so that will become usual which was unusual, and that will become agreeable which was disagreeable, and that fashionable which appeared unfashionable."—*Musical Opinion* (London, Eng.).

Curing the "Off Key" Singer

By Elizabeth Wattles

NOTHING more sorely tries the patience and nerves of the teacher than the pupil who sings "off key." Because it is one fault which the pupil does not readily recognize in his own voice, overcoming it depends upon the teacher more than the pupil.

To help pupils to remedy this fault I have used a method both simple and effective. We devote the first part of the lesson period to ear training while I play a very short phrase, possibly only three or four notes, the pupil is asked to listen carefully. Then he tries to sing exactly what has been played, not only singing the correct pitch, but with correct time value. This sounds almost childishly easy; but it is surprising to find how many people cannot at first register an absolutely correct impression of even four or five tones. This number includes not only those who habitually sing "off key," but many who are merely unobservant and careless.

To begin, we use only phrases of three or four notes in major keys with the simplest intervals. Then as the pupil learns to concentrate on hearing correctly, longer phrases with more difficult intervals, some of them in the minor keys, are taken. Sometimes phrases are improvised; but more often they are selected at random from a book of songs. The first sign of improvement is when the pupil begins to realize that he sings "flat," even before he is able to correct the fault. This simple device of "matching" tones has proven most effectual in the most stubborn examples of "off-key" singing.

Overcoming Stage Fright

By Earl S. Hilton

STAGE fright begins to take possession of a person the moment he is requested to give a public performance. The more he thinks of this appearance, the more he feels it impossible to do so. The nearer the time comes, the greater this terrible feeling possesses one.

Now what is the cause of this frightful feeling which makes one think and act so unnaturally? Each may answer this from his own experience.

Here are some causes:

(1) The piece was insufficiently prepared.

(2) It was a first or second appearance in public.

(3) Fear that the audience would find fault with the performance.

(4) Self-consciousness, caused by imagining the audience thought our playing a joke.

Now, how did we overcome this stage fright? Simply by thinking and acting contrary to the causes mentioned.

Here are the remedies:

(1) Allow sufficient time to prepare thoroughly each piece to be played in public.

(2) Frequent playing before an audience, whether it be composed of two or of two thousand.

(3) Imagine the audience to be pleased with the playing; or, better still, lose yourself in the music and forget the presence of the audience.

(4) Feel equal to the occasion, and that if the playing were not really worth while the people would not have come to hear it.

Etude Cover Design Contest

$250.00 Prize

THE ETUDE Herewith Announces a Prize Contest Open to All for Cover Designs Suitable for Our Publication.

REGULATIONS

1. The designs must have distinct musical significance with an appeal to a large a section of THE ETUDE'S widespread body of readers as possible.

   The design should be attractive from the News Stand (the selling standpoint), but must also make an effective cover for the music lover's home.

   Designs with a historical, educational or humorous trend will be considered with interest. Designs that are merely allegorical, purely idealistic with Grecian, Roman, or essentially antique grounds are not solicited. THE ETUDE is a practical paper for music-lovers, teachers and students of to-day.
2. Designs may be for two- or three-color reproduction.
3. Designs must be drawn in proportion to reduce to the standard size of THE ETUDE, 10½ inches wide by 13½ inches high.
4. The design must not bear wording or lettering.
5. Avoid the introduction of lyres, pan-pipes, lutes, antique instruments, banjo, guitar, etc. If an instrument is used employ the piano, organ or the instruments of the symphony orchestra.
6. Any contestant may submit as many designs as desired.
7. The ownership of the copyright of the winning design will rest with THE ETUDE.
8. All designs submitted must bear upon the back the full name and the address of the artist.
9. Postage to insure return must be sent with every design.
10. THE ETUDE assumes no responsibility for loss of or damage to any design, but every possible care will be taken of the designs while in our offices.
11. The contest will close Dec. 1st, 1924

Address all designs to

ETUDE COVER DESIGN CONTEST

1712 Chestnut Street, Philadelphia, Pa.

ETUDE friends everywhere are requested to notify their artist friends of this contest. Big names do not mean anything to us in comparsion with effective, attractive, beautiful cover designs. Art Schools and Art Departments of Colleges everywhere are invited to co-operate with us in this contest.

EVER SEE A BABY WITH

Freckles

Of course not. Nobody is born with freckles. Then why tolerate them? Why permit freckles to ruin your appearance?

Quickly and surely they will disappear if you use Stillman's Freckle Cream. Double action—not only are your freckles dissolved away but your skin is whitened, refined and beautified. Guaranteed to remove freckles or money refunded. Most widely used preparation in the world for this purpose. Snowy white, delicately perfumed, a pleasure to use. Two sizes, 50c and $1, at all druggists.

Write for "Beauty Parlor Secrets" and read what your particular type needs to look best. Full of beauty treatments, make-up hints, etc. If you buy $3 worth Stillman toilet articles in 1924, we will present you with beautiful large size bottle perfume free. Send for booklet now.

BESSIE ABBOTT

GOUNOD

As a means of contributing to the development of interest in opera, for many years Mr. James Francis Cooke, editor of "The Etude," has prepared, gratuitously, program notes for the production given in Philadelphia by The Metropolitan Opera Company of New York. These have been reprinted extensively in programs and periodicals at home and abroad. Believing that our readers may have a desire to be refreshed or informed upon certain aspects of the popular grand operas, these historical and interpretative notes on several of them will be reproduced in "The Etude." The opera stories have been written by Edward Ellsworth Hipsher, assistant editor.

"Romeo et Juliette"

Probably the most distinctive indication of the charm and vitality of the operatic works of Charles François Gounod (1881-1893) is that his two best known works have been on subjects selected by several other composers for operas, all of which have practically vanished, except the "Mefistofele" of Boito, which differs from "Faust" in many particulars and is really a music drama of very distinct character. Shakespeare's "romance of the ages," "Romeo and Juliet," has been set no less than twenty-two times. Among those who have undertaken the task are, Pasquali, Vaccaj, Zingarelli, Steibelt, Bellini, Thome, and the American composer, Harry Rowe Shelly.

"Romeo et Juliette" came along in 1867, eight years after "Faust," when Gounod was almost fifty years old. It was given first at the Théâtre Lyrique in Paris London and New York saw it first in the same year. The first American *Juliet* was Minnie Hauck (a New York dramatic soprano, reported to be living in Switzerland in poverty).

"Romeo et Juliette" was not at first regarded as a great opera worthy of the Grand Opera, but it was eventually produced at the famous Parisian Grand Opera in 1888, twenty years after its composition, following the ancient formula of "the prophet in his own country."

One of the striking romances associated with the opera was that of Adelina Patti, who, when she was the Marquise de Caux, was won over by the fervent love making of her *Romeo* (Nicolini) and afterwards became his wife. In fact, at one performance at the Paris Grand Opera the famous French tenor (whose real name was Ernest Nicholas) startled even the Parisian opera-goers by accompanying the balcony scene with twenty-nine kisses.

While "Romeo et Juliette" has never been as popular in America as in France, it has numerous admirers who side with the French in regarding it as superior to "Faust." The score may be regarded as "deliciously melodic," with its entrancing Valse breaking out every now and then like the aroma in a rose garden. The text, of course, does not follow Shakespeare's play; and the opera contains characters and scenes not found in the Bard's masterpiece. The librettists were criticized for trying to make another "Faust," but the opera book, nevertheless, is an exceedingly good one.

Gounod wrote twelve works for the stage, but only two are of outstanding significance, nothwithstanding the spectacular success of "The Queen of Sheba."

While musicians such as Sir Charles Villiers Stanford are restless under Gounod's technical superficiality ("Gounod played with the fringe of great things, but was clever enough to avoid swimming in deep water"), it must be obvious to all that the very longevity of his works indicates a vitality which few composers ever attain.

Lack of "feature numbers," such as the *Jewel Song*, the *Soldiers' Chorus* and *Salve Dimora* in "Faust," possibly accounts for the fact that the Shakespeare work is not so widely demanded in this country as the one based upon Goethe's medieval fantasy.

The Story of "Romeo et Juliette"

The plot of the opera is drawn from and follows Shakespeare's popular drama, which is founded on the love of representatives of noble families, the Montagues and Capulets, between which a deadly feud exists.—ED.

Act I—A Ballroom in *Capulet's* House, Verona. A masked fête in honor of *Juliet's* entry into society, is being given by her father. After being welcomed by *Capulet* and presented to *Juliet*, the guests go to the banquet hall, *Juliet* remaining behind and singing the famous *Waltz Song*. *Romeo* enters, is attracted by the young lady's beauty and manages to speak with her, the situation developing into an impassioned love scene. *Tybalt*, a hot-headed Capulet, recognizes *Romeo*, threatens his life for presuming to enter the house of his enemies, but is restrained by *Capulet* and dancing begins.

Act II—*Capulet's* Garden. *Juliet's* Apartments above. *Romeo*, again braving his enemies, enters and lauds the charms of *Juliet*. As *Juliet* appears on the balcony, *Romeo* conceals himself, and she sings to the stars, of her new-found happiness. Then follows a long love scene interrupted by *Gregorio* and his retainers in search of *Romeo* and by *Juliet's* nurse calling her to come in from the night.

Act III—Scene I—The Cell of *Friar Laurence*. *Romeo* and *Juliet* meet in the *Friar's* cell to ask him to marry them. He at first demurs, but finally agrees, hoping thus to mend the breach between the rival houses. The vows are taken and *Juliet* returns home with her nurse.

Scene II—A street in Verona. *Romeo's* page, *Stephano*, enters seeking his master. While he sings to attract the attention of *Romeo*, *Gregorio* enters, angry at having been awakened, scolds the disturbing youth, and, recognizing him as a companion of *Romeo* on the night before, draws him into a fight which is interrupted by *Mercutio* and *Tybalt*. *Romeo* enters, attempts to make peace, is insulted, and kills *Tybalt*. The *Duke of Verona* happens to be passing, hears of the affair and banishes *Romeo* who, however inwardly vows to see *Juliet* again.

Act IV—*Juliet's* Room. At the risk fo his life, *Romeo* has found his way to his bride's room. As he says his farewell, *Capulet* and *Friar Laurence* enter to tell *Juliet* that *Tybalt's* dying wish was that she should marry *Paris*. Left with the priest she tells him she would rather die than to lose *Romeo*. *Friar Laurence* counsels patience, as he has a plan for their being reunited, and gives her a potion to be drunk when her wedding with *Paris* is imminent. *Friar Laurence* leaves; *Capulet* and *Paris* approach; *Juliet* drinks the potion and apparently dies in *Capulet's* arms.

Act V—*Juliet's* Tomb. *Juliet*, still in her trance, lies on a bier. *Romeo*, having failed to receive *Friar Laurence's* message, believes *Juliet* dead, forces the door and enters. As he swallows a phial of poison he discovers signs of life in *Juliet*. Learning of *Romeo's* act, *Juliet* ends her own life with a dagger after which they unite in a final love duet and farewell.

"I wish we had a piano like this one. I can't play that old rattle-trap of ours at all. Mother's always getting after me to do my practicing, too. You're mighty lucky, Jane."

"We've had this Weaver ever since I can remember, and it's always been just perfect. Everybody that plays it is crazy about it. Funny the difference there is in pianos."

"I just love to play your piano, Jane"

The difference in pianos—it isn't funny; often it's tragic. Dissatisfaction and embarrassment; money spent for piano lessons lost because the pupil won't practice—all can be caused by a poor piano.

The Weaver Piano has given Jane's family pride, satisfaction, enjoyment—ever since she can remember. For the beautiful tone and perfect mechanical action that so distinguish the Weaver last through a lifetime of constant use.

Buy a Weaver Piano. Convenient terms are easily arranged, and a liberal allowance made on your former piano. Write us for the name of the nearest Weaver dealer, and ask for the Weaver catalog. Weaver Piano Company, Inc., Factory and General Offices: York, Pa. Weaver, York and Livingston Pianos and Player Pianos.

WEAVER
PIANOS

A Volume of Fourteen Beautiful Dances, Fully Described, with Music for Each

NEWMAN
ALBUM
OF
CLASSICAL
DANCES

Foot drawings and diagrams of all the figures, and illustrations of all the movements are given carefully.

The dances are arranged in the form of Solos, Group Dances and Ballets, making them particularly attractive for class work. The music is keyed with the description. The music is all of a high character, having been carefully selected from the writings of noted composers.

Cloth Bound, Stamped in Gold

Price, $2.50

THEO. PRESSER, 1710-12-14 Chestnut St., Philadelphia, Pa.

SUMMY'S CORNER

IT is with much satisfaction that we announce the publication of a FESTIVAL SUITE for Organ by STANLEY T. REIFF. The Suite consists of four numbers which are published separately because it is believed that they will serve their purpose to better advantage as separate numbers. The numbers are as follows:

PRELUDE *in G Minor*........................$ .75
ROMANZA *in Eb major* .... .50
SCHERZO *in C minor and major* 1.00
TOCCATA *in G major* 1.25
(Subject to the usual discount)

The PRELUDE is bold, vigorous and with fine movement. The ROMANZA, simple by contrast, is a charming bit of melody writing and delightfully treated. The SCHERZO is a bright, happy, tuneful concept, decidedly pleasing. The TOCCATA has the dash and swing that will arouse the enthusiasm of any organist.

The Suite will be found most desirable as a program number and not so difficult as to take it out of the sphere of excellent teaching material. The ROMANZA is particularly available for pupils of the earlier grades.

Suites for organ lately published that have met with marked success:—

RURAL SKETCHES *by Gordon Balch Nevin*. $1.50
FIRESIDE FANCIES *by Joseph W. Clokey* 2.00

The Organist's Etude

It is the Ambition of THE ETUDE to make this Organ Department "An Organist's Magazine Complete in Itself"

Edited by Well-Known Specialists

Choir Loft "Don'ts"

[A Canadian friend has asked us to reprint the following excellent article from the London *Musical Opinion*. THE ETUDE prints very few "dont's." The word is too suggestive of "Verboten." We would rather encourage the American spirit of "Do." However, these "don'ts" may prove preventative when accepted in the spirit in which they were written. The successward man will turn them into "do's."—EDITOR'S NOTE.]

IT is hoped that the following will be received in their intended spirit by the many organists who are content to work always in one sphere of action—in one groove, so to speak—making little, if any, effort to improve the musical capacities that have been theirs from their youth. At the same time, it is to those who *are* endeavoring, heart and soul, to make forward progress that these suggestions and reminders apply, though with a lesser degree of force; for even the best are liable to err and all of us need continual stimulation in our work, particularly the organist whose labors are consecrated to the worship of God.

The Organist with "Soul"

People in general do not appear to realize how influential a factor music is in regard to Christianity and that the part of the organist in divine service is of the utmost importance, influencing as it does the whole atmosphere of the church. In order to exercise a beneficial influence, it is evident that every phase of the organist's duty must be in keeping with its sacred surroundings; and in order to effect this, the organist must be a born musician—he must produce *music*. One man may possess a highly developed technical ability, but this does not necessarily imply that he is a true musician. Far from it. A man of meagre *technic* and of "soul" is the greater *church* organist. So it is better that the organist confine his studies to the acquirement of the art of devotional playing and accompaniment rather than to the acquirement of a brilliant *technic*.

It is a sad fact that so few study this side of the organ, and this is the more to be regretted because it is so much more interesting and helpful in the religious sense to them and indirectly to those who have the pleasure of listening to the results. In some cases, however, of those who pay little attention to this question, opportunity and means for its study are lacking; in others, initiative; and again in others, even energy. To all these an appeal is made to attempt to remedy these drawbacks as far as they possibly can, keeping in mind the while that they are servants of God and of His church; and that as such it is their duty to try to make themselves as perfect as possible in everything they have to do and *be*—in demeanor and outward being as well as in inner life.

The Congregation Wants to Worship

Don't imagine that a congregation is present at a service to listen to the organ. It is there to worship; and it is your duty as organist not only to join with but also to aid them. The organist often hinders this with his undevotional playing.

Don't forget that what talent you possess is the gift of Almighty God. Use it to His glory and give of your best.

Don't allow your playing to be noisy. Speaking generally, let your accompaniments be soft and unobtrusive. Sudden outbursts of tone should be avoided; though they can be made extremely effective if introduced in the right place and in the right way.

Don't let the choir accompany you. Many organists do, so be one of the few that don't.

Don't forget that, if you are choirmaster as well as organist, it is your duty to set a good example to your choir. The example set by many organists is the reverse of good.

Don't expect good tone from your boys with an accompaniment of swell reeds; boys imitate to a certain extent the predominating tone quality of the organ. Let this be flute and diapason, especially the flute. Reeds are far too much in evidence among the generality of organists and they pall on the ear most aggravatingly. Remember this.

Don't start the service next Sunday morning by pulling out "swell to great" and closing the swell box. Many organists do; and not only this but "swell to great" is left out throughout the service. Also, if the stops on the swell are occasionally played upon alone, with the box left open, it is suprising how different they sound.

Don't cultivate an ostentatious style; let your demeanor, and incidentally your treatment of the organ, be quiet.

Don't habitually use "swell to oboe" in the playing of the Psalms. It is one of the combinations which palls most and should therefore be used least. Find out by experiment as many good combinations on your organ as you can; the bottom octaves of all the 4ft. stops are often of great utility. It is surprising how much variety can be obtained from the smallest organ by the exercise of a little ingenuity.

Prepare Voluntaries

Don't hurry into church at the last moment and start extemporizing a voluntary in a meandering and a formless fashion. Let all your voluntaries, extemporized or otherwise, be carefully prepared; no matter how easy a piece may seem, it can sound the reverse of good if inartistically interpreted. Play what is good *only* and let it be solid and dignified in character. Avoid "sugary" and sentimental pieces which, so far from being suitable for the church, are only suited to the theater. If you do extemporize, try to do so in form, making your extemporization interesting and devotional; but especially take care to begin and end in the same key. Remember that extempore playing is an art in itself and therefore requires study.

Don't try to imitate the orchestra on the organ. It is impossible to do so and always will be. Sir Walter Parratt, in his lecture on "Transcriptions" before the R. C. O. at Cardiff, has well said: "Mimicry in art is always degrading!"

Don't use the pedals as frequently as you do. A constant 16ft. tone is most irritating. The 8ft. stops on the pedal are far too much neglected. In future, therefore, do not let these pass unheard. Sometimes they make charming new solo stops.

Don't forget that a noisy organ accompaniment covers a multitude of sins on the part of the choir and the choirmaster, who is possibly yourself. Train your choir to be independent of the organ and thus show that their training is cared for.

Don't keep your right foot firmly fixed on the swell pedal. Remember the late Sir John Stainer's remarks on this subject in his organ primer.

Don't play voluntaries that are beyond your power; but, if you possess a good *technic,* don't fail to put it to good purpose. People will appreciate the music of Bach, Mendelssohn, Rheinberger and the rest if properly rendered. If your playing of the classics is worth listening to, people will stay and listen.

Don't play pieces which possess no artistic value but which are merely written to display the fancy stops. The latter are for the better rendering of the music, so pieces written merely for the vulgar display are not worth the paper they are printed on.

Don't Overdo Solos

Don't overdo soloing, part inversions and free accompaniments. Unless you possess the best of judgment, the latter should not be attempted. In the hands of many players all these are vulgar in the extreme.

Don't make so much use of the manual to pedal couplers if your pedal organ contains 8ft work. If it is adequately provided for, use the couplers even less. Organists seem liable to forget that the pedal organ is, or should be, a complete tonal department in itself and quite distinct from the manuals.

Don't distract the attention of the congregation by "word painting;" neither "flies in all their quarters" nor "caterpillars innumerable" can be illustrated by chromatic scales on the piccolo or anything else. Neither are attempts at thunder and lightning effects at all in keeping with the worship of God. Rather go to the other extreme and do very little descriptive work. Let what little you can do be artistic, musical and barely *suggestive*.

Don't be content to hear the effect of your organ from the console; get a friend to play for you occasionally while you yourself listen from the other end of the church.

Don't make frequent use of the celeste, vox humana or (especially) the tremulant and other such stops. Fancy stops, if used seldom, can be very effective indeed. If used often they can be quite the reverse, palling terribly on the ear.

Don't introduce appoggiatura, arpeggi and other more or less questionable ornaments into your accompaniments.

Care with Stops

Don't forget to let your stops be heard sometimes by themselves. For instance, many organists use with their diapasons such stops as the gamba, 8ft. and 4ft. flutes, but they little know how much better they would sound if used entirely alone.

Don't make ill-judged use of octave couplers. It is chiefly in the softer combinations that they are useful. For the purest effects, single stops sound the best with them.

Don't be too fond of 16 ft. tone on the manuals. Let it be used discreetly and *never* in the "giving out" of fugue subjects, treble leads and so on.

Don't use the swell pedal without cause and always close the box before adding louder stops.

Don't play continually on the bottom octave of the pedal-board; the effect of so doing is very wearisome.

Don't use "great to principal" without plenty of tone on the swell, unless your organ is a beautifullly scaled and voiced instrument. The effect of this combination is too often screamy.

Don't be untidy; keep your organ loft and your music desk free from litter. A neatly arranged console generally betokens a neat organist, both in playing and in method.

First Lessons in Organ Pedaling

By Dr. Annie W. Patterson, B. A.

THE main difficulty in organ playing is, undoubtedly the correct management of the pedals. Many teachers postpone the study of these until several lessons in manual control have been given; but this as a rule, is a mistake. The sooner this bridge is crossed, or at least approached, the better. So, during the course of the second organ lesson, at all events, the instructor should draw the attention of the student to a keyboard which lies beneath his feet, the notes upon which he will be required to pick out and cause to sound as a blind man would approach the keys of the piano. In this case, however, not fingers, but heels and toes are requisitioned, and the problem to be faced mainly concerns the neat and accurate "placing" of these so that bass-passages, and, in some instances, regular melody phrases, may be announced on the pedal clavier.

Sitting Right

Possibly the earliest step in the acquirement of "playing with the feet" is to get the pupil to sit absolutely in the center of the organ-stool and then bid him, with the point of his left toe, try and "fish for" the lowest pedal note (low C) of the compass. This is usually found by stretching the left leg as far as it can comfortably go; and, in order to check by ear the finding of the correct sound, a triad or common chord of C major may be held down on the "Great" or "Swell" keyboard, with soft diapason (4-foot) registration. The note having been located, feeling with the toe for the two raised levers that represent respectively C sharp and D sharp, the left heel—or, if found more convenient, the side of the left sole—may now try for D. At this point the soft chord on the manuals may be relinquished—it was only to help the ear in making a start. The hands—in this initial exercise at all events—may now lightly rest for support on the keyboard ledge. This is essential for some players, who often complain that they feel like tumbling off the stool if they have not some sort of support until the art of balancing is attained. The left heel (or side of shoe) being on D, an attempt should now be made to find the next sound in the scale of C, namely E. The toe will indicate the raised key between, so that without undue twisting, the left heel or sole may now quietly and neatly be shifted to this interval (E). The semitone from E to F will be found by a forward sliding of the foot. The performer is advised mainly to press with the flat side of the toe, and caution is to be observed, from the very beginning, to play "cleanly;" *i. e.*, on no account to let two pedal notes sound at the same time.

"Fishing"

As the left foot moves upwards, the striking of notes (as the balancing) becomes easier. "Fishing" with the toe for the raised notes (corresponding to the black notes on the piano representing F sharp, G sharp and A sharp), the learner will gradually "feel out" G A and B natural. When C (second space, bass clef) is reached, the teacher may try to inculcate, even at this early stage, the art of "alternate" pedalling. This means the division of the labor of pedalling between the two feet.

Thus, if C (beneath Middle C) be taken with the left foot, the right foot may try for D. Or else, as may be found easier; left foot on C may be followed by right foot on the third above (E); then might come the following series: D (left foot) F (right foot); E (left foot); G (right foot); F (left); A (right); G (left); B (right; sliding, perhaps, by same foot, to Middle C). Intervals of sixth and octave can be practiced in a similar (alternate) way—always the best for clear organ pedalling. The chromatic scale, with toe and heel-work, can be attempted subsequently in much the same fashion. But, from the very first, the student should try to do all *without looking* at the pedal keyboard. Sometimes the "coupling" of this to a manual shows what pedal key is depressed; but the most expert players prefer to do without such aids. Only when considerable facility is gained in solo pedalling should combined playing with the manuals be attempted.

The Postlude

By E. M. Herron

How poetic are the words:

"Hearing God's message while the organ rolls
Its mighty music to our very souls."

How deplorable that the church organist should take them literally!

Nothing could be more disconcerting to the dispersing congregation, nothing (except a church fight) more greatly handicap the pastor, than the ear-splitting burst of chords (and discords) that smites the amen of the benediction!

The minister, having made strenuous use of voice and energies during the last twenty minutes, hastens to greet his flock, strains to catch their questions and answers, but all about him is that nerve-racking din.

The people, having waited in hushed attention to the message from the pulpit, arise soothed, at peace; or they are inspired to enter quietly upon some work for the Master. They turn welcoming faces upon their friends, to find the next minute everybody from pastor to the tiny tot caressed by the ruling elder shrieking and gesticulating. Pandemonium reigns for several minutes then something snaps into place; all is serene again and no one thinks to attribute the feeling of relief to cessation of the organist's activities.

Inspiring is the sweet far-away music of the offertory; why should not our emotions be uplifted at the close of service with low, haunting strains to be carried hence?

Organ Practice in Cold Churches

By Fred. J. Tighe

A recent article discussed the subject of the organist's practice during the winter season when the church is cold.

In the Episcopal Cathedral, of St. Louis, the organist has, or had some time ago, a canvas tent tacked in sections on wooden frames. This was erected on Monday morning over the console and taken down at the week end. The enclosure was heated with a gas stove.

I have utilized the same idea myself for the past three years, using two electric reflectors, one on each side of the pedals. The reflected heat warms the cold draft that usually comes up out of the pedal board. I have used a coal oil stove—either heat is quite efficient, but the oil stove makes the enclosure stuffy, and in any case is against the fire insurance regulations.

I mentioned the idea to Dr. Herbert Sanders, of the Dominion Methodist Church, Ottawa, Canada, who went one better and had a collapsible beaver board house constructed.

As far as the cold church problem is concerned, I find it is absolutely solved by the above arrangement.

A Performer's Partiality

By Will Cowan

Dr. Crotch, the eminent English organist and composer, who linked the eighteenth and nineteenth centuries in the annals of British music and was the first Principal of the Royal Academy of Music, said, "Mere performers are seldom better judges of the music they execute than actors are of dramatic writings; and, like them, generally form their judgment from the reception *their own* part meets from the public."

In this there is an intimation to either the student or teacher who would be wise. Personal friends enjoy and laud what we do because they unconsciously interpret our offerings in the warm light of their emotions toward us. Their endorsement and encouragement often cheer us and inspire the courage that keeps our eye on the great goal of high achievement. But along with these we should seek the advice and criticism of disinterested professionals and critics, use them as our real criterion in measuring our accomplishments, and strive to eliminate the weaknesses they may suggest. It is thus that we will equip ourselves for the impersonal attitude with which the public will judge our work.

Very Early English Church Music

Tudor Church Music, Volume I. Cloth bound; 268 pages. Published by the Oxford University Press, American Branch, at Twelve Dollars per volume.

This first volume of a monumental work is devoted to the life and works of John Taverner (1495-1545). The pages giving the "Historical Survey" prepare the way by beginning with John Dunstable (about 1390-1453), "the first great name in the history of polyphonic music." A chapter on "Sixteenth Century Notation" is invaluable to the one interested in the manuscripts of the earlier composers. Historical data relating to Taverner's life are very complete, and are followed by two hundred and twenty-five pages of his masses for the Church service. The complete work is dedicated to His Majesty King George V. The Trustees of the Carnegie United Kingdom Trust have placed the musical world under obligations for the great work they have accomplished. The student of Musical History, as well as the musical bibliophile, will welcome this unusual set of books to their collections.

The Choir Master

Each Month Under This Heading We Shall Give a List of Anthems, Solos and Voluntaries Appropriate for Morning and Evening Services Throughout the Year.

Opposite "a" are anthems of moderate difficulty, opposite "b" those of a simple type.

Any of the works named may be had for examination. Our retail prices are always reasonable and the discounts the best obtainable.

BOOKS *for* MUSIC LOVERS

A comfortable occupation in warm August moments is the reading of a book in some cooling and protecting shade. Music lovers using such moments for adding to their fund of musical knowledge profit thereby.

Secrets of the Success of Great Musicians

By Eugenio Pirani Price, $2.00

A series of biographical studies of the great masters written by a well-known teacher, pianist and composer. With keen perception Mr. Pirani has penetrated the philosophy of the life success of these great music masters, quite a few of whom were personal acquaintances, and reveals them to the reader with a writing charm that is irresistible. Illustrated.

Music and Morals

By H. R. Haweis Price, $2.00

Very few books in the history of the art have had more influence in stimulating an interest in music than this work. It contains over four hundred pages of fascinating reading matter including essays upon musical subjects, biographies of the great masters and an instrumental section in which a chapter on carillons is especially noteworthy.

Standard History of Music

By James Francis Cooke Price, $1.50

This history is told in story form—so clear a child can understand every word—so absorbing that adults are charmed with it. Just the thing for amateurs, concert-goers and self-study pupils. Handsomely illustrated.

Musical Progress

By Henry T. Finck Price, $2.00

A series of practical discussions upon interesting matters in the "tone-world" of today, making informative and entertaining material for anyone interested in music. There has been no other musical literature work in recent years that has received so much favorable comment from critics and others high in the musical world. Those loving music will find this book a real "treat."

Great Singers on the Art of Singing

By James Francis Cooke Price, $2.25

Twenty-seven foremost artists of opera, oratorio and concert have contributed to this book chapters giving advice and suggestions based on their own personal experience. Each chapter is preceded by a full-page portrait and short biography of the artist. An invaluable book for voice teachers and students, concert and opera-goers and phonograph owners.

Life Stories of Great Composers'

By R. A. Streatfield Price, $2.25

The lives of great composers are charts to enable us to navigate our own careers. They show us the rocks to avoid and the ports to make. This book contains thirty-five biographies, each followed by a chronology of the composer. Illustrated with full-page portraits.

Old Fogy, His Musical Opinions and Grotesques

By James Huneker Price, $1.25

A collection of exceptionally original critical observations from the pen of the late James Huneker, considered by many to be his most interesting work. It is undoubtedly one of the most frank expressions of opinion on musical matters in print.

Great Pianists on Piano Playing

By James Francis Cooke Price, $2.25

A series of thirty-six educational conferences with renowned masters of the keyboard, presenting the most modern ideas upon the subjects of technic, interpretation, style and expression. An entire chapter is devoted to each artist, supplemented by an excellent portrait and biography. An absorbingly interesting book that should be read by every teacher, student and performer of the instrument.

Piano Playing with Piano Questions Answered

By Josef Hofmann Price, $2.00

In this informative book one of the foremost contemporary pianists has written nearly one hundred pages of essays and answered two hundred and fifty questions bearing on piano playing. This book is highly recommended to piano teachers.

Mistakes and Disputed Points in Music and Music Teaching

By Louis C. Elson Price, $1.50

It is a magnificent thing to have positive information and this work will straighten out many a slip-shod musical education. It covers all the essential points from acoustics and notation to piano technic and orchestration. An ideal book for spare-time reading.

Descriptive Analyses of Piano Works

By Edward Baxter Perry Price, $2.00

A poetic, dramatic and historical analysis or description of some of the greatest and best known piano compositions by Chopin, Beethoven, Liszt, Weber, Schumann, Grieg, etc. These descriptions undoubtedly will aid the player to a better understanding of the piece in question or its interpretation.

Stories of Standard Teaching Pieces

By Edward Baxter Perry Price, $2.00

This captivating book has helped and inspired thousands of teachers and pupils. It is a companion volume to *Descriptive Analyses of Piano Works* and is even more interesting and useful, as it deals with pieces from the third to the seventh grade by such popular writers as Godard, Rubinstein, Nevin, Schytte, etc.

Music Publishers and Dealers—Mail Order Music Supply House

The Ready Interlude

By William Reed

The importance of being prepared for the playing of regular and emergent interludes that may occur in a church service cannot be too soon realized.

The resources available for these purposes may be thus summarized: Reference to the material for interludes as indicated in publishers' catalogs; the use of excerpts from such organ compositions as are not commonly known; the choice of fragments, complete in themselves, from standard organ music of to-day; the making of adaptations from organ-like writing in general; and, lastly, improvisation.

In all these cases similar considerations are to be observed, viz.: some variety as to length, key, harmonic coloring, and always, of course, a reasonable appropriateness.

As a beginning, and also to meet emergencies, short preludes, and interludes, written for this purpose, should be kept at hand, these being previously marked with reference to related keys, suitable consecution and so forth. The next thing would be to look up the older school of organ writing, such as the 30 Preludes by Rink (Organ School, Book 1), writings by Hesse and other composers, besides new and old collections of short voluntaries, among all of which are to be found well-rounded little movements, a considerable proportion of which are less familiar in these days than they deserve to be.

If excerpts are chosen from well-known organ music, care must be taken that these be *lifted out*, so to speak, with no appreciable mutilation of a composition as a whole—not always an easy matter to accomplish.

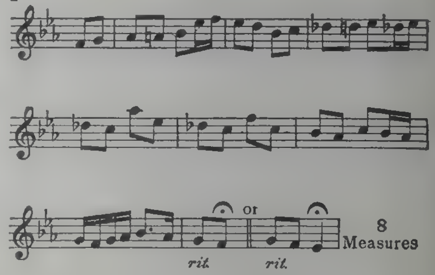
On the other hand, arrangement and adaptation offer wide possibilities; so much so, that a young player should not hesitate to appropriate all he can find, irrespective of the source, and then to sift out and judiciously apply whatever promises to be of organ-like service for interlude purposes. And in all this searching-out and adaptation it is to be remembered that interludes, because of their limited scope, admit of but little, if any, development; an equally ideal perspective being that an interlude is not intended to represent a mere stop-gap or filling-in, but, as far as it can be made so, a suggested link in a continuous chain.

Improvisation has a distinct usefulness and possesses certain definite advantages. There is, however, no royal road to its effective handling; it grows only through well-advised cultivation. Even those gifted with facility in this direction soon realize the necessity for proceeding by knowledge and method. Unless this is done, frequent attempts at ready improvisation are apt to become a temptation to indolence in a player, as well as a weariness to the listeners.

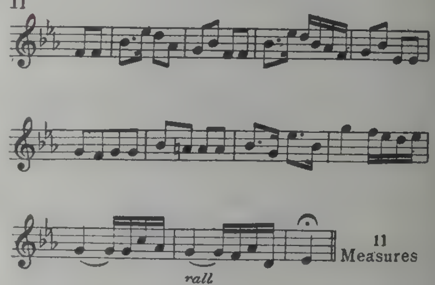
In liturgical services it sometimes happens that several sentences are read, a short interlude being played between each. Here, an eight to twelve measures period is desirable, the continuous chain above mentioned being easily kept in view. Song-like periods work in admirably and are readily found, the effect being here suggested.

Taking No. 2 of Mendelssohn's *Christmas Pieces,* the first interlude can include the first ten measures. The second and third interludes would be as follows:—

I



II



Proceeding on the above principle, interludes of the exact length needed can often be readily constructed, their definite form rendering them all the more acceptable because of their easy apprehension.

In the hands of a tasteful improviser, phrases from hymn tunes may be turned to effective account, since in dealing with such the thematic atmosphere will be felt throughout, even though necessarily mingled with other matter, or even somewhat altered from the original. This type of interlude will have more point if a tune just previously sung is used, and provided circumstances permit of its being extended beyond the ordinary limit.

Anthems for a Quartet Choir

By E. F. Marks

With a quartet choir, directors should be very careful about the selection of anthems, as many compositions adapted to a chorus would be utterly unsuited to a quartet. For instance, the *Hallelujah Chorus,* from the "Messiah," sung by a quartet, or even a double quartet, would be disappointing, yet when sung by a chorus of fifty or more voices would be most agreeable.

Usually the anthems written for a chorus progress by the degrees of the diatonic or chromatic scales, with easy leaps confined to the tones of the triad of the seventh chords; they possess simple rhythms, elementary modulations and familiar cadences; whereas, for a quartet anthems may abound in complex rhythms, intricate harmonic cadences and unusual melodic progressions, and be more brilliant and free in style than if written for a chorus.

Quartet music could well be compared to instrumental chamber music, which is the acme of absolute music. There is no intrusion of the personality of a director or soloists as in a choral production. The music exists alone in its purity (especially when the quartet sings without accompaniment); and therein lies its great worth.

The value of a splendid solo-quartet in a church cannot be overestimated for the good it does towards educating the congregation to the beauties of pure music; even if the quartet is augmented by a chorus or a second quartet, which in this latter form, gives the ideal church choir, and makes it possible to present contrasts between the purity of the simplicity of the quartet and the colorful chorus.

Occasionally I have known churches to dispense with their quartet choirs entirely, and in lieu thereof place a chorus choir, usually composed exclusively of members of the congregations. This is a grave mistake; the quartet should by all means be retained, and the musical members of the congregation be added to this essential nucleus.

NATHANAEL SPADY

Concert pianist, teacher and composer of music. Music composed to words in all grades. (Samples). Complete copies of music for piano, vocal, or violin will be forwarded to any address for 25 cents in stamps postpaid.

Address PROF. NATHANAEL SPADY
30 Duke Street,
Waterloo,
Ontario, Canada.

Question and Answer Department

Conducted by ARTHUR DE GUICHARD

Always send your full name and address. No questions will be answered when this has been neglected.

Only your initials or a chosen nom de plume will be printed.

Make your questions short and to the point.

Questions regarding particular pieces, metronomic markings, etc., not likely to be of interest to the greater number of ETUDE readers will not be considered.

Pitch—Concert Pitch—Vibrations

Q. *Will you tell me what is meant by Concert pitch of A457 vibrations, or C544 vibrations; that is to say, what do A and C stand for?*—Hilda M., Cienfuegos, Cuba.

A. By "pitch" is meant the relative height of sounds, A representing the note in the third space of the treble clef—the same as the A string of a violin: C represents the third above it, or the note in the fourth space of the treble clef. The pitch of a note depends upon the number of vibrations per second. The French "Normal" pitch, generally adopted is that by which the note A has 435 double vibrations per second and C about 517. "Concert pitch" indicates the highest pitch—employed for orchestral compositions. Thus, A435 or C517 (equal temperament) is generally used for vocal music not accompanied by orchestra. The pitch you mention is very high, although an opera orchestra in the summer would be about C545. Pitch had always been variable, until the French established, by law, their standard Normal Pitch. It had ranged all the way from A404 (in 1699) to the A457 which you quote.

Additional Accompaniments to Handel's Works

Q. *What is understood by "additional accompaniments" to compositions by so great a master as Handel? Are they necessary? Does it not seem like sacrilege, tampering with and spoiling great masterpieces—something on a par with adding to the text of Shakespeare?*—J. T., Troy, N. Y.

A. The two are not parallel cases. Shakespeare's literature was complete; anything added would be like trying to "paint the lily" or "to gild refined gold." Handel's compositions, on the other hand, similar to those of Bach and others of that period, were but sketches written over a figured bass, the harmonies of which were filled in by the organ or harpsichord, according to the knowledge and skill of the accompanist. Examine any copy of the "Messiah," particularly the bass Aria: "The People that Walked," and see how bald and empty it is with the accompaniment in unison or octaves with the voice; then compare it with the remarkable and beautiful accompaniments added by Mozart. He who has once heard and studied them would never wish to do without them. Some composers have defaced and defiled the works of the great masters by their incompetent additions. But the additional accompaniments by Mozart and Robert Franz to the compositions of Bach and Handel are quite worthy of the masterpieces they have completed.

Point d'Orgue—Pedal-point

Q. *What is a Point d'orgue and in what kind of composition does it occur? Is it the same as a pedal-point?*—H. G. G., Broadway, New York City.

A. The English equivalent for "point d'orgue" is "pause" or 𝄐 It is used to prolong the duration of a sound or of a rest. It is of frequent occurrence in all species of composition. A "pedal-point" is not the same. It is a long sustained note, towards the close of a fugue, usually on the dominant or fifth of the key, on which imitation, subject and answer, and even the stretto are constructed. But the stretto sometimes precedes and sometimes follows the pedal-point.

Olla Podrida

Q. *Please tell me the meaning of: Fünffach; 8 füssig; Dutch concert; Cancrizans.*—Quizzical, Broad St., Philadelphia, Pa.

A. Fünffach is a German word meaning "five-fold;" applied to a mixture stop of an organ; "having five ranks." 8-füssig, or 8 ft., an organ pipe of 8 ft., having the same pitch as the male voice of the 'cello. A Dutch concert is a species of entertainment wherein each man sings his own song while the man next him is singing his own—more convivial than Dutch. It appears that there is another kind of Dutch concert in which each person present, by turns, sings one verse of any song which may please him, some well-known chorus being used after each verse. When each one has sung his verse, all sing their respective songs at the same time as a grand finale! "Cancrizans" is a term applied to a canon, meaning a canon by retrogression, that is, *walking backwards like a crab.*

An American Literary-Musico

Q. *Could you give me any account of one J. S. Dwight, an American musician, I believe?*—F. T., Back Bay, Boston.

A. John Sullivan Dwight, born in Boston, Massachusetts in 1813, died there in his eighty-first year. A graduate of Harvard, he entered the pastorate but gave it up to devote himself to literature. In 1852 he founded "Dwight's Journal of Music," then the best musical magazine in America, which he directed until its publication ceased in 1881. He was also president of the Harvard Association for many years, with Karl Zerrahn as director.

Physiology and Study of Singing

Q. *I am studying singing, at present in its early stages. My teacher insists that I should learn all about the physiological structure of the larynx, before anything else. Is it necessary for me to do so? It seems to put an obstacle in the way of my voice freedom which, before, was so good. Will you kindly advise me?*—Baritone, 42nd St., N. Y.

A. The study of the physiology of the voice organs by a beginner in learning how to sing is far from essential; indeed, it may (and usually does) become a positive hindrance, as in your case. The preoccupation and anxiety to use the larynx in a particular way will surely set up a certain strain, a constriction of the throat which is fatal to free emission and to beauty of tone. In a few years' time, when you shall have acquired freedom and beauty of voice, you may study its physiology, but not before.

Inter-relation of Major Keys

Q. *What is the best and quickest way to how the inter-locking, that is, the inter-relation of major keys, frequently referred to as the "circle of the fifths?"*—A. C. D., Providence, R. I.

A. A major scale is composed of two similar tetrachords, with one whole tone (or major 2nd) between them. A tetrachord consists of four notes (Greek, *tetra*, four). These four notes comprise two tones and a half-tone (or two major seconds and a minor second). For instance: The major scale of C, 1st tetrachord is C-D-E-F; C to D one whole tone, D to E one whole tone, E to F one half-tone. Allowing for the interval of a whole tone, the 2nd tetrachord is G-A-B-C, that is, two tones and a half-tone—exactly identical with the 1st tetrachord. *But this 2nd tetrachord of the key, or SCALE, of C is also the 1st tetrachord of the key, or SCALE, of G.* Leaving the interval of a whole tone, the 2nd tetrachord of G is D-E-F♯-G. The F is made ♯ to keep the order symmetrical of *tone-tone-halftone*. And this 2nd tetrachord of G is the 1st tetrachord of the key, or SCALE, of D......and so forth through all the scales, until we arrive (through the flats) again at the scale of C. Notice that in order to reverse the process and inter-lock the scales through the flats, we will *descend* through the tetrachords, counting them as one half-tone and two whole tones descending, still with a whole tone between the two tetrachords. Thus: the 1st tetrachord of C (C-D-E-F) becomes the 2nd tetrachord of F (*viz.* F-E-D-C): then the whole tone interval C to B flat, and then B flat A-G-F or the scale of F.

A Delving questioner who Delves Not for Answers.

Q. *An inquirer, who elects to be known as "Delving," sends a list of twenty-six, questions, most of which are of an elementary kind easily solvable by recourse to any good musical dictionary or any good work on musical theory.*

A Had the Delver delved, as persistently and conscientiously for the answers as she has digged for the questions, she would have received a rich reward; because the frequent use of books of musical reference is a fertile field of information and musical education. Need of space for other questioners prevents any reply here. If, however, "Delving" will reduce the number of questions to those which cannot be answered from the books indicated, they shall be taken care of in these columns.

Movable Do—Metronome speed.

Q. (*a*) *I have heard the words "Movable Do" used frequently in reference to Solfeggio; what is its meaning?* (b) *How should I solve the following question of Metronome speed?—Composition is marked Allegro Vivace, with* 𝅗𝅥. =60. *Time Signature is ¾ with four sixteenth-notes to one beat.*—James Taylor, Boston, Mass.

A. (a) "Movable Do" is the term applied to that system of Solfeggio or Sight-reading, whereby the tonic, or foundation-note, of each scale is called "Do" and the succeeding names accordingly (re, mi, fa, sol, la, si (or ti), do). Note well that this "Do" is the name given to any *major key-note*—the minor key-note being always "la." (b) The "metronome-speed" question is simply resolved. The four-sixteenths to one beat makes the beat a quarter-note and there are three quarter-notes to the dotted half-note equalling 60; therefore the quarter-note equals three times 60, or 180. But the real beat is a 𝅗𝅥. at the rate of 60 per minute as indicated by the metronome mark, or one beat to a second; therefore, three quarter-notes per second.

(Continued on page 573)

FRECKLES

Don't Hide Them With a Veil; Remove Them With Othine—Double Strength

This preparation for the treatment of freckles is so successful in removing freckles and giving a clear, beautiful complexion that it is sold under guarantee to refund the money if it fails.

Don't hide your freckles under a veil; get an ounce of Othine and remove them. Even the first few applications should show a wonderful improvement, some of the lighter freckles vanishing entirely

Be sure to ask the druggist for the double-strength Othine; it is this that is sold on the money-back guarantee.

MUSICAL TECHNIQUE WITHOUT PRACTICE

Reading music at sight, rapid fingering, flexibility of wrists and a fine Vibrato for pianists, violinists, and 'cellists acquired by a few minutes' daily practice away from the instrument.

The Violinist's Etude

Edited by ROBERT BRAINE

It is the Ambition of THE ETUDE to make this Department "A Violinist's Magazine Complete in Itself"

De Kerekjarto on the Vibrato and its Uses

By Arvid A. Erickson

IN spite of the fact that every famous violinist uses the vibrato to a greater or less extent, realizing the beautiful effect it can produce, and in spite of the fact that the skilful and artistic use of vibrato enriches an otherwise dry or monotonous passage and gives to it warmth, color and vitality; nevertheless the published information on the subject is wholly inadequate.

Few persons, even accomplished musicians know how and when to use the vibrato. This is frequently evidenced by the exaggeration constantly heard in the playing of many violinists. In fact, some teachers fearful of this tendency to overdo, discourage the use of vibrato by their pupils, almost entirely.

The result is that most students of the violin flounder in the dark, being unable to find anything of a practical nature regarding its proper usage. This lack of available information may be due partly to the fact that even among the foremost violinists there is no unanimity of opinion in regard to the vibrato, and partly that many musicians have no theories or ideas about it, except that "it comes naturally and unconsciously, or not at all." They contend that the feelings and emotions of the musician should govern its use. While in general this may be true, nevertheless there are certain specific principles which should apply.

Duci de Kerekjarto, the famous Hungarian violinist now touring this country, has a few interesting observations on this subject. With the assistance of his father, Julius de Kerekjarto, who is a professor of physics in the University of Budapest, young Kerekjarto has made a study of the vibrato from a scientific as well as a musical point of view. From this study he has worked out a theory, not necessarily original with him, but which he has put into practice, with results that have been partly responsible for the cordial praise of critics in all parts of the world.

Sympathetic Vibrations

In general, his theory is that the vibrato should be used slightly or vigorously according to the note played. In the case of a note which has a corresponding open note elsewhere on the violin, only a slight vibrato is necessary because of the sympathetic vibrations from the other strings. For instance, D played on the G string, needs but little vibrato because of the open D string. If the D is played slightly sharp or flat, however, there will be no sympathetic vibrations from the open D: therefore the intonation must be perfect.

Other examples of notes which need little vibrato assistance are E on the G or D string because of the open E string, A on the G string; E, D, and G on the A string.

Mersenne, who has been called the father of acoustics, "observed that when a string was set in vibration, a neighboring string in unison with it would also vibrate, although it might not have been touched. And he found this to be the case not only when the strings were in unison, but also when the second note was an octave or a twelfth below the first."

Here are de Kerekjarto's suggestions as to the intensity of the vibrato to help to give the various tones color, warmth and brilliancy:

A played on the G string needs only a slight vibrato because of the sympathetic vibrations from the open A string.

B should be played with considerable backward and forward movement of the finger, as there is no open string to correspond.

C does not need much help because it forms a note in the C major chord, with the open E string as another note in this chord, which will be set into sympathetic vibration and reinforce the sound.

D played on the G string needs but the slightest assistance because of the considerable vibration from the open D string, one of the strongest on the violin.

The same holds true of the other strings. For instance, E on the D string is assisted by vibrations from the open E string. F needs considerable vibrato movement, there being no open string of the corresponding note.

Whenever the vibrato is used in playing sharps or flats, it should be fairly strong, as there are no open strings to produce sympathetic vibrations.

The vibrato movement should also vary according to the proximity of the note played to the violin bridge, the nearer to the bridge, the shorter the movement. It should be almost imperceptible when playing upper E or notes above this on the E string. Above A, there should be no vibrato, Kerekjarto says, because the slightest movement of the finger forward or backward produces a variation in the pitch and therefore a disturbing tone.

There are of course, exceptions. The slightest kind of a vibrato, played very rapidly, may be used on long notes, even as high as upper A; otherwise, this note would become too dry and monotonous.

Comparing the vibrato by strings, the G string being the heaviest, needs the most intense movement, but slower than on the other strings. A shorter and lighter movement of the finger should be used when playing on the D string, gradually reducing to the slightest but most rapid movement on the E string. It is so easy to produce the vibrato effect on the responsive E string that one is tempted to overdo it.

The Strength of the Vibrato

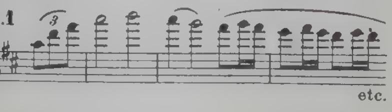
The strength of the vibrato should vary also according to the pressure of the bow, a firm forte application of the bow requiring a rapid, intense vibrato, whereas an easy vibrato of medium speed should be used in playing a soft, legato note. The vibrato should never be used when playing staccato or spiccato. These are supposed to be dry, technical notes, played with rapidity, and if the vibrato is attempted, then the sound waves and vibrations of the different notes by lingering in the sounding body of the violin, overlap, resulting in a blurred effect.

In playing double stops, the same frequency of vibration for both notes should be sought, and to this end the vigor and speed of both fingers in their forward and backward movement should be the same. Otherwise, with two different frequencies, there will be interference, one set of waves masking the other so that again the effect will be spoiled.

What has been said about the lightness or vigor of the vibrato movement when notes are played singly may be disregarded entirely when playing double stops, as in this case, the two tones help each other in the matter of vibrations. Double stops, Kerekjarto maintains, should always be played with a rapid vibrato.

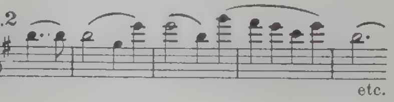
There are instances, of course, when the vibrato should not be used at all, or so slightly as to be almost imperceptible. Take the case of the first eight measures of the main theme of Beethoven's concerto, written in the upper register. These tones speak so beautifully for themselves, they do not need any assistance from the vibrato. It is only in rare cases that an artist can embellish it with success, for the rendition like the music itself should be simple. The measures are appended here.

Ex.1



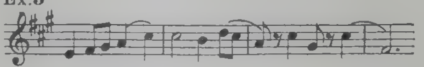
As an illustration of music written in a lower register, where a vibrato of medium intensity may be used, the main theme of Mendelssohn's E minor concerto as follows is cited.

Ex.2



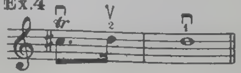
Careful use of a fairly vigorous vibrato will heighten the effect in a passage such as the secondary theme of Paganini's D major concerto, which is written still lower and is full of expression.

Ex.3



If the last two notes at the end of a passage are the same, an entirely different color and much warmth may be obtained by shifting, for instance, from the second to the first finger, using the first finger for the final note, and giving that note a strong vibrato. The bow must always be changed thus.

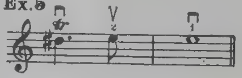
Ex.4



The first D in the above illustration should be played with a light vibrato, while the second and final D should receive a vigorous vibrato with a strong finish.

Kerekjarto has used this method with excellent results. As an illustration, he cites from the second movement of Grieg's sonata in G major as follows.

Ex.5



Greater resonance and vitality can be obtained when playing an open string like G, D or A, by stopping but not bowing that note on another string and using a vigorous vibrato movement on the note not played. For instance, in playing the open G alone there is a lack of intensity, but the tone may be made both warm and brilliant by stopping G on the D string at the same time and using the vibrato on the "silent" note.

Over Training

THE greatest single reason why there is such a scarcity of really good violinists in any community, is that they are shockingly over-trained while they are trying to learn to play the violin. In trying to go too fast, they end up by getting nowhere. Violin playing is a plant of very slow growth; and the steps by which it is learned must be sure and thorough if the violin student expects to arrive anywhere.

Many letters reach THE ETUDE from violin students, in which they give lists of the studies and exercises they have mastered (?) and asking if they have made the proper progress for the time they have studied. Some of these lists of pieces and exercises show a state of affairs that is almost unbelievable. One young man announces that he is taking up the study of Kreutzer and Fiorillo after studying the violin for only eight months. Another is studying the *Mendelssohn Concerto* after a year and a half study, and has "taken" all the standard studies besides. It is needless to state that pupils of this type have been completely wasting their time. They do not really *play* these compositions at all. They have no bowing, no tone, no certain intonation, and very little technic; yet they are thrilled by the great names on the covers of the books of studies and compositions they are studying and think they are making wonderful progress, simply because they are "playing at" some of the great works of violin playing.

Some of the most thorough violin teachers keep their pupils on easy studies in the first position for six months or longer without allowing them to make a single shift; but these "hurry up" students have studied all the positions and started on Kreutzer and the standard concertos in six or eight months. They are trying to do in a certain number of months what it takes other talented students, who are studying with really thorough teachers, the same number of years to do. Needless to say, such pupils get nowhere. They are trying to build a house without a foundation.

The mastery of violin bowing in its myriad phases, is alone the work of years, to say nothing of the wizardry and legerdemain required from the left hand by the writers of great works for the violin. How then can any student expect to master the violin in a couple of years, practicing an hour or two a day, as so many do?

In some cases the pupils, and in others the teachers, are at fault in this overtraining. Some teachers rush their pupils ahead at a break-neck speed at the expense of thoroughness. Things go fast in America, as they do in all new countries which are being rapidly developed; and many teachers allow a desire to make a showing in their teaching to get the better of their judgment. They try to force their pupils along at a rate which precludes thoroughness. They like to have great names and great compositions on their recital programs, even should the pupils not be able to live up to them.

In other cases the fault is on the part of the pupils. Little Evabelle Perkins wants to play *Humoresque* before she has reached a stage where she is reasonably certain whether there are one or two sharps in the key of G. G. Washington Smith wants to play concertos before he is very sure of Raff's *Cavatina;* and many pupils are trying to persuade their teachers to give them pieces which are far in advance of their technic and general musical ability.

In cases of this kind the teacher will find it to his advantage not to yield. He should not allow pupils to study works far in advance of their state of progress, for nothing is so ruinous as "playing at"

The Most Popular of All Modern Instruction Works for the Pianoforte

SCHOOL FOR THE PIANOFORTE
By THEO. PRESSER
IN THREE VOLUMES
Vol. I—Beginner's Book
Vol. II—Student's Book
Vol. III—Player's Book
Price, $1.00 each

BEGINNER'S BOOK
SCHOOL FOR THE PIANOFORTE—VOL. ONE
Used More Extensively than any other Elementary Instructor for the Piano

The simplicity of this work has enabled many teachers to achieve speedy results with even the youngest beginners. This is a "first reader" in piano study. The whole work is bright and interesting.

"Beginner's Book" makes an Excellent Introduction to any Course or System of Piano Study. "Beginner's Book" is the Instruction Book with the Red Cover that is familiar to Thousands of Pupils and Teachers.

STUDENT'S BOOK
SCHOOL FOR THE PIANOFORTE—VOL. TWO
A Work that Aids the Pupil to Progress because it Presents Interesting Material that the Teacher can Use Successfully

Takes up the subject just where the "Beginner's Book" leaves off, and is, of course, intended to supplement that excellent instructor, but it can be used very successfully for any student who has done the work of the first grade, up to, but not including the scales.

PLAYER'S BOOK
SCHOOL FOR THE PIANOFORTE—VOL. THREE
A Superb Offering for the Instruction of Progressing Young Players in the Various Phases of Piano Technic

Pleasing study material arranged in progressive order, treating somewhat in detail trills, octaves, two notes against three, the pedal and other matters necessary to technic. Memory study and ear training are specially stressed.

Teachers may secure any of these volumes for examination.
These volumes are sold by leading music dealers everywhere.

compositions which the pupil is not yet ready for. Besides, no one in an audience is fooled by a violin student trying to play a piece much too difficult for him. They know he is not doing it justice. People judge by their ears and not by the name of the piece or composer on the program.

Scales for Fun

By Katherine Morgan

On one of the "get together days" (and every class should have them) divide the class into sides, a captain for each side. Have the captain to keep in touch with all pupils on her side.

At the next club meeting ask each captain to play the scales with someone in the other class. For example, captain No. 1 will call for one of her number; captain No. 2 will call one of her's. Inspire them to try to outdo each other in point of good work. Continue until each pupil has played one or more scales.

After this ask the pupils to tell how they practice their scales. Then have them to relate their methods, discuss their strong and weak points and how to overcome their difficulties.

If, as teachers, we only can awaken a love for the work, the battle is more than half won.

Now take up the different forms of scales. Whatever you do, make heart musicians. Get at the great fundamental principles of scale study.

False Courage

Since the memory of man runneth not to the contrary, the human race has been seeking elixirs which will control the mind, which will produce courage, love, exaltation, and emotions of various kinds. Ponce de Leon combed Florida in search of a Fountain of Perpetual Youth; and there are legends by the thousand of magic springs which would do all sorts of marvelous things to those who bathed in their waters or drank of them. Then we have the famous opera, the "Elixir of Love," with its barber hero who produced an elixir which, when partaken of, would inspire love.

It is not strange then that people who suffer with stagefright and nervousness when playing the violin in public should try to find some means of overcoming this nervousness. A violin teacher from Canada writes to the Violinists' Etude: "Some time ago I read in an issue of the Etude of a chemical substance, the vapor of which had a stimulant effect, as a means to help to overcome nervousness on the concert platform. Not having clipped the item for my scrap book, I should be glad to learn the name of this substance."

I cannot recall any such paragraph in the Etude, nor do I know of any substance answering this description. It is quite true that some people take stimulants of one kind or another to assist in overcoming nervousness, but I think it is a mistake for any public performer to rely on preparations designed to give them any kind of "false courage."

I have known of people taking bromidia (which contains a certain amount of chloral) and other bromides, wine of cocoa, alchoholic drinks of all kinds, wines and beers, and strong black coffee, strong tea, and all sorts of stimulants and nerve bracers. From long experience in training pupils for public performance, and from talking to concert artists on the subject, it is my unalterable opinion that the best thing to take, if anything, before one goes on in a public performance is a drink of pure cold water, a glass of bromo-seltzer, or a cup of tea or coffee. Most people do not find it necessary to take anything at all. Nothing of a narcotic nature should be taken without the advice of a physician.

Probably the most popular nerve bracer (before prohibition) was a little sip of whiskey or brandy just before playing. I have often been told by janitors of concert halls, theaters, and even churches of finding bottles which had held whiskey, or other kinds of "false courage," after the performance. Often vocalists, even of the fair sex, smuggled tiny phials of liquor in muffs and hand bags to be used just before the critical moment.

Anything which unduly stimulates or tampers with the brain is injurious, if one would play his best. The mind should be perfectly clear, and not in the muddled state which stimulants produce.

German musicians, as a rule, have the right idea on this subject. It has long been a saying among German musicians that the time to drink stimulants is *"after,"* and not *"before"* the performance. I have often heard musicians play in public while under the influence of stimulants, and it always detracted from the success of their performance. The most pitiable spectacle I ever saw was the performance of a cello concerto, with orchestra, by an eminent cellist, while he was in such a maudlin condition that he talked and "kidded" with the people in the front row of the audience. I had heard this artist play when in normal condition, and the performances were very different.

In a musical performance, both mental and mechanical processes are involved, requiring the nicest coördination between mind and muscle. Taking any drug which interferes with this exquisitely exact coördination cannot fail but to injure the performance, just as would be the case if sand was thrown into a finely balanced machine. For this reason the public artist should avoid narcotics and stimulants if he would have his powers at the highest.

The number of splendid artists who have been ruined by stimulants and drugs is legion, and for this reason the wise violinist will keep his brain and nervous system in a perfectly normal condition, as nature intended it.

A Help For 'Cellists

By Caroline V. Wood

A 'cellist should not lift his fingers from the strings any oftener than necessary but should keep them in place, when possible, where the notes are to be repeated almost immediately. This will seem hard when first given attention, but persistent practice, with a definite object ahead, will do wonders. In fact, the sooner a student realizes this, the faster he will progress in anything.

There are many good studies which are very helpful in overcoming this fault of lifting the fingers from the strings unnecessarily, such as Kummer's third etude in Opus 106. It will require constant watchfulness, when practicing these

VIOLINS

Summer Vacations Will Soon Be Over

pupils will be ready to resume their studies and the experienced teacher is now making plans and preparations toward a prompt, satisfactory opening of

Next Teaching Season

The season of 1923-1924 was, from the standpoint of the musical profession, the most successful ever, both artistically and financially. "Radio Broadcasting" has brought good music into homes where it was never known before and with its advent a newly-kindled ambition, ***the acquiring of a musical education,*** has entered the minds of many. As a result the approaching season promises to be even more successful and every progressive teacher who realizes the value of being ready knows that

Now is the Time to Order

NEW TEACHING MATERIAL

For a number of years it has been the custom with many teachers to order their music supplies well in advance of the season's opening, as this affords them an opportunity to examine and classify the material at leisure. For the convenience of these teachers we have instituted a special service known as the EARLY ORDER PLAN.

This plan is to book the annual "On Sale" orders during the early summer months subject to delivery on or before a date specified by the teacher. Orders received up to August 15th, are combined in one shipment prepaid to central distributing points and from there forwarded at small expense to the several consignees. The saving in transportation charges is an important item, but of much more consequence is the certainty of having one's music supplies on hand and ready for use when the pupils arrive for their lessons.

Write today and tell us

The approximate number of pupils you expect to have during the coming season.

The grades you will teach and the styles of pieces and studies you prefer to use.

The date when the material should reach you.

The Advantages of This Unique Service

You will receive the best possible assortment of material sent on our liberal "On Sale" terms, all not used being returnable at the end of the teaching season in June, 1925, when settlement is made.

You will benefit by having an adequate supply of material on hand when ready to begin next season's work.

You will save a considerable part of the delivery expense.

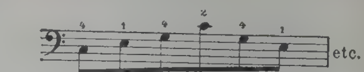
studies, to derive the proper benefit from them. However, this practice is well worth while, as it is a great aid in playing rapidly and accurately, and, of course, really makes it easier in the end, as it saves the locating of so many notes oftener than necessary.

The accompanying illustration serves admirably as a preliminary exercise for this sort of practice, though many other similar ones may be devised by the student. In this exercise it will be observed



that the only finger which needs to be lifted from the strings is the fourth. The others, once they are down, should stay there throughout.

Little Hints

When the sound-post of the violin has been set in the proper position, by a good violin maker or repairer, so that the violin gives the best tone of which it is capable, it is a good idea to have him draw a pencil mark around the foot of the sound-post, so that, in case it accidentally falls down, it can be re-set at the exactly right spot, where the most favorable tone was produced.

The position of the sound-post has a great deal to do with the quality of tone any violin produces, and is not the same for all violins by any means. Some violins sound better with the post farther back from the foot of the bridge than others. Spohr, the famous violinist, in his well-known "Violin School," advised the violinist to experiment with the post in different positions, farther from or nearer to the foot of the bridge, and when the most favorable spot was found to have the post set always at that point. For this experimenting he advised removing the end pin, so that the violinist could look through the hole when setting the sound-post, to see that it exactly fitted the arch of belly and back, and that it occupied the correct position in every way. Such experimenting takes a great deal of time, as the strings have to be let down, and then retuned, in the case of each experiment. If, however, the exact spot can be found where the violin gives its best tone, the time is well spent. It is of the utmost importance that the sound-post occupy the correct position. The French call the sound-post, *"L'Ame du Violon"* (the Soul of the Violin), so important do they consider the correct placing of this little stick of pine.

Violin Questions Answered by Mr. Braine

Anton Loffman

T. T. J.—Sorry I cannot trace Anton Loffman, 1573, violin maker. There are thousands of violin makers unknown to fame.

The Two Helmer's

R. B.—There were two Helmer's of Prague, violin makers, Johann Georg Helmer, 1687-1770, a pupil of Eberle, and Carl Joseph Helmer, 1739-1812. The quality and value of the violins of these makers is somewhat variable, but, while they would hardly be classed as famous makers, they have a fair reputation in the violin-making world. Send your violin to a dealer in old violins for appraisement.

On Recommending Instruments

F. B.—In justice to its advertisers, the Etude cannot discuss the merits of various makes of violins, pianos and other instruments, advocating the purchase of any special instrument to the exclusion of others. Besides, all the violins made by any special maker do not run exactly the same in tone quality. Some turn out better than others. For this reason I would have to examine any certain violin before pronouncing it good.

Biographies

G. T.—There is an extended and excellent article on Stradivarius, and also one on Stainer, in Sir George Grove's Dictionary of Music and Musicians, which no doubt will be found in your public library.

The Violin Bridge

J. K. T.—In choosing a violin bridge it is very important that it be made of wood of the finest quality, well adapted for making violin bridges. You cannot expect the best results from common bridges which you buy for ten or fifteen cents. Violin makers usually charge 50 to 75 cents or more for a first-class violin bridge, with an additional charge if they fit the bridge to the violin. Do not try to fit your own bridge; it takes a professional violin maker to do the work.

A Guarnerius

T. Y. H.—It is not *absolutely impossible* that your violin should turn out to be a genuine Joseph Guarnerius; but at the same time it is highly improbable. You might find a diamond necklace on the street some morning, or find a lion in your back yard. These things are not out of the range of possibility; but you must admit, they are extremely unlikely to happen.

Spiccato, Sautille

E. Y.—You will find full explanations of spiccato, sautille, saltato and ricochet bowings in the work, "Violin Study and Violin Teaching," by Eugene Gruenberg. However, a lesson or two on these bowings by a good teacher would be worth all the printed explanations in the world, as these simply cannot be made clear without actual demonstration with violin and bow.

A Stradivarius (?)

A. W.—The chances are that your violin is simply one more of the millions of imitation Strads., which delude people into thinking that they have violins worth thousands on the strength of their containing counterfeit Stradivarius labels. If you are willing to go to the expense of having your violin examined, write to some of the firms who deal in old violins, who advertise in the Etude.

Tone Devices

R. O. B.—There are so many devices on the market to be attached to the violin, which the inventors claim will work a wonderful improvement in tone that I do not know which one you mean, since you have forgotten the name and cannot furnish a description. 2—The great concert violinists do not use any "attachments" supposed to improve the tone of their violins.

Violin Making

G. R. T.—There are many excellent works dealing with violin making. One of the best is "Violin Making," by Walter H. Mayson, the English violin maker. There is an American edition of the work.

Tone Remedy

S. P.—As you are under instruction, your teacher should be able to tell you what is wrong with your tone and how to remedy it. I can tell you nothing without hearing you play. You might get some ideas from works on violin playing like "The Violin and How to Master It,'" by a professional player; "Violin Study and Violin Teaching," by Eugene Gruenberg, or "Violin Technic," by Frank Thistleton. If you could go even for a single lesson to a first-class teacher, he could tell you at once what is wrong after hearing you play.

Lupot Violins

A. M. S.—Lupot was one of the greatest violin makers of France, and his violins are valuable. However, there are many imitations. You will have to have your violin examined by an expert, to ascertain if it is genuine.

Violin Chords

L. A.—In the example from Bach which you send, the note G is part of a four part chord. It would read as follows: D-G-B flat-E. The four-part chord on the second beat of the measure would read C sharp-G-A-E. These are played as broken chords, with one stroke of the bow.

Jacobus Stainer

T. M. C.—Jacobus Stainer was the greatest violin maker of Germany. His violins are valuable. The number of imitation Stainer's is immense. Your only course, if you wish to learn the value of your violin, which has a Stainer label, is to submit it to an expert. No one can tell without looking at it.

J. H.—In justice to its advertisers, the Etude prefers not to express opinions in regard to violins, pianos, cellos and other instruments of modern make. Besides, it would be pure guess work to try to give you the value of a violin I have never seen. 2—Unless your fingers are abnormally long, and have abnormally thick tips, a reasonably large hand is not a draw-back in violin playing. 3—The best remedies for stage fright are very frequent public performances, and great care in preparing the piece to be played. If you have studied your piece so thoroughly that it is easy for you to play it, the chances are you will not suffer from stage fright when you go before the public.

W. A. K.—Keep your thumb bent throughout the entire stroke of the bow.

GROVE'S DICTIONARY OF MUSIC AND MUSICIANS WITH

New American Supplement

SIX LARGE VOLUMES BOUND IN RED CLOTH AND STAMPED IN GOLD : : :

There are 4,000 pages and over 5,000,000 words from great authorities upon all phases of musical learning. The books are liberally illustrated with cuts, half-tones and notation examples. Thousands of subjects are discussed: Biography, History, Musical Science, Theory, Musical Industries, Instrumentation, Æsthetics, Musical Terms, etc., etc. The work is the most notable musical compendium in any language.

Have these splendid musical books in your own home. What the Encyclopedia Britannica is to General Information the Grove Dictionary is to Music.

There is no better Musical Reference Library at any price in any language.

The Value of this Monumental Work has been Augmented by the Recent American Supplement

It is an indispensable record of American Musical Achievement, Personages, Organizations and Institutions.

The total number of entries in this work is over 2650. Brief reference is made to about 2000 American Musicians but biographical sketches are made of 700 American Musicians. A number of important foreign contemporaries have been mentioned in this work and the many general articles cover subjects such as Indian Music, Negro Music, Orchestras, The Piano, Ragtime, Public School Music, The Phonograph, etc.

THE PRICE OF THIS LATEST EDITION WITH NEW AMERICAN SUPPLEMENT IS

$20.00

BUY YOURSELF A SET ON EASY TERMS

Notwithstanding the low price made for cash we accept orders subject to part payments. Write for terms.

The set is also given as a premium for obtaining subscriptions to THE ETUDE.

Questions and Answers

(Continued from page 569)

Why is C the "natural key?"

Q. *Why is the key of C frequently termed the natural key of C? My pupils often ask me for a reason and I am unable to find a plausible one.*—Teacher, Warren, O.

A. 1. The best way to reply is to show by the keyboard of the piano that the major scale of do, re, mi, fa, sol, la, si, do, can be played from *C only*; that is, by using only the white keys (or *naturals*). If any other tone be made the starting note, the correct sounds of this scale could be obtained only by employing accidentals (that is, sharps or flats—the black notes). 2. A glance at the keyboard will show that the eight notes beginning on C is the only series which will make the semitones or half-steps occur in their right places (3-4 or mi-fa, 7-8 or si-do) without using any black keys.

Pitch: Concert and Classical.

Q. *Which is higher, Concert or Classical Pitch, and how is the latter determined?*—Lois, Boston, Mass.

A. Concert pitch is the higher. Classical pitch is determined by the number of vibrations per second of the note middle C, namely, 256. Concert pitch is variable; often about 270. Piano manufacturers are chiefly responsible for this, in their endeavor to give greater brilliancy of tone to their instruments.

Greek Modes and Our Modern Scales.

Q. *How far back can our present-day scales be positively traced? Have they any affinity with the ancient Greek modes? How many were there of these?*—Student, Broad St., Philadelphia, Pa.

A. Our present-day scales can be positively traced back to the ancient Greek Modes and, perhaps, also to the Persian and the Hindoos. Pythagoras, about 530, B. C., is looked upon as the first musical scientist. There were seven ancient Greek modes, or manners of arranging the sequence of tones and semitones: Lydian, Phrygian, Dorian, Hypo-Lydian, Hypo-Phrygian, Hpyo-Dorian, and Hyper-Dorian or Mixo-Lydian. Our major scale of C (C, D, E, F, G, A, B, C) is similar to the Lydian mode; and our oldest form of minor scale (A, B, C, D, E, F, G, A) is similar to the Hypo-Dorian mode (also termed the Aeolian or Locrian mode).

Musical Forms—the Period, Phrase.

Q. *1. What is meant by a Musical Phrase? 2. What is Form, and what are the principal forms?*—Ralph B., Cincinnati, O.

A. 1 A musical period is a musical sentence, forming a complete rhythmical whole, which may be subdivided regularly into halves, quarters and eighths. Thus: a Period is divided into halves, called Sections; these are divided into halves, called Phrases; and these again into halves, called Figures. Thus a Period, consisting of eight measures of common time, would contain two sections, or four phrases, or eight figures. 2. Form refers to the style of architecture in which the music is constructed. As in architecture (and music has to be built) musical form is founded on Unity, Contrast and Symmetrical Balance. The primitive musical germ, or form, is the figure; this is built up into phrases, sections and periods. A complete period is one complete form. The chief Forms are: Scherzo, Minuet, Song, Rondo, Suite and Sonata—together with their variants and developments.

Vocal instruction by books—or by mail!

Q. *(a) I would like to know how to get head-tones of the proper quality; (b) how to get very low tones that are loud enough to be used in singing; (c) some good scale that will help in acquiring timbre of the voice, which is a bass-baritone?*—J. H. B., Des Moines, Ia.

A. It is practically impossible to learn singing (that is, technic, attack, resonance, timbre or quality) from books or by mail, or from any written or printed description; you would always run the great risk of acquiring a wrong method, which would damage your voice and, most probably, give you a chronic congested throat. (a) Consult a competent singing teacher. (b) We cannot sing lower than our vocal mechanism will permit. If, however, the low notes required can be sung at all, they may be very much improved in resonance and in quality by a forward position of the lips and cheeks—*loosely, no rigidity of lip*—tongue forward, lightly touching lower front teeth, so that there may be no pressure upon larynx. (c) Practice *descending* scales of an octave, upon every degree from A flat to D flat (that is: A flat down to A flat; A natural down to A natural; B flat down to B flat, and so forth up to D flat). Better still consult a good teacher.

Who Wrote "Kate Kearney"

Q. *Will you, please, tell me the names of the author and the composer of the song "Kate Kearney;" also where I can procure it?*—Gael, New York

A. The song is an old one, the words having been written about the year 1803, by Lady Morgan. The music was composed by Alexander Lee. The song is to be found in "Irish Literature" by John D. Morris (Philadelphia, Pa.) as well as in "Delaney's Song Book, No. 42."

"Pianist"—Glass "tinklers"—Wants "a Conservatory position in the States."

Q. *Please give the correct pronunciation for "pianist?" (b) What is the name of the glass-tinklers that are hung in halls or verandahs that, clinking together, give a musical sound? (c) I hold a Teacher's diploma in music; am teaching in the country for experience, having taught in my home town for two years. This is a very backward place, for my pupils soon drop off, as they think a year's music study sufficient. What are my chances for a Conservatory position in the States?*—L. D. C. M., Quebec, Canada.

A. (a) The correct pronunciation is pi-an'-ist (pronounce: pea-ann-ist). Some pronounce it pie'-an-ist, but this is a vulgarism. Other pronunciations are heard occasionally, but the first named is the generally accepted correct one. (b) The name popularly given to the "glass-tinklers" is "Chinese Chimes;" they are however known commercially as Wind-bells. (c) It is impossible to guage your ability as a teacher or your "chances" for a conservatory position anywhere without hearing you and testing your powers of imparting your knowledge. Everything depends upon musical attainments, teaching proficiency and tact. A first-class teacher is acceptable everywhere; a mediocre or inferior teacher is a "drug on the market" and wanted nowhere.

New Musical Books

The Boyhood of Edward MacDowell. By Abbie Farwell Brown. Cloth Bound; two hundred and fifty-one pages. Published by Frederick A. Stokes Company, at two dollars per copy.

A book that reads as charmingly as a romance. Not only the boyhood but also the youth and early married life of this eminent American composer are placed before the reader. The pages are liberally illustrated, an especially interesting feature being the original drawings done by MacDowell in his youth when music had not yet quite enthralled him and he was divided in mind as to which muse he should follow. The book makes fine reading for either the child or adult and should be in every musical library as well as in the collection of everyone interested in knowing of the lives of those who have added to the cultural growth of our nation.

The Confessions of a Prima Donna. Author anonymous; three hundred pages; cloth bound. Published by Frederick A. Stokes Company, at two and a half dollars per copy.

Ostensibly the autobiography of a renowned singer, this book gives a very clear insight into the devious paths leading to the primrose path of the operatic footlights. Amid a good deal of rather palpable romancing is a rather clear delineation of the struggles, the trials, jealousies and triumphs attending the progressive climb that ends in artistry and its rewards. The pages will prove of no small interest and value to the aspirant for vocal laurels, giving a glimpse of much that is good to do as well as warnings of pitfalls to avoid. Very pleasant reading withal.

How to Sing. By Luisa Tetrazzini. Cloth bound; one hundred and thirty-six pages. Published by the George H. Doran Company at two and a half dollars per copy.

In thirty "talks" with young singers the celebrated Diva gives of her great knowledge of the art of true Italian vocalism. Tetrazzini's sensational voice she cannot bequeath; but some of the secrets of the marvelous manner in which she used it she has succeeded in confiding to the pages of her book. The language is exceedingly clear and often so picturesque as to lead the reader to feel at once the sensation of doing the thing desired. Of the giving of advice there is no end; but when advice is so sane as in this book it were well that it be accepted. Among the most practical publications of its class.

Elementary Theory and Practice. By Robert Bartholomew. Flexible manila bound; fifty-two pages. Published by The John Church Company, at seventy-five cents per copy.

A short, simple treatise, introducing the student to the fundamentals of musical theory. The book is designed for school use and is intended to give to the student a preparation for the serious study of harmony. A skillful blending of text and written examples gives a pleasing type to the work.

Shakespearean Music in the Plays and Early Operas. By Sir Frederick Bridge. Cloth bound; ninety-three pages; illustrated. Published by E. P. Dutton, at five dollars per copy.

The musical world owes to the late Sir Frederick Bridge no small debt for the loving care with which he has compiled this work. Indeed he has made very interesting reading for the musician with a taste for the quaint in music and its history. Portraits of the Elizabethan composers, as well as *facsimiles* and modern reproductions of the original manuscripts of many of the Shakespearan songs enliven the pages. A book well worth the possessing.

Look Inside the Piano for this Trade-Mark

WESSELL, NICKEL & GROSS NEW YORK STANDARD TRADE MARK

The Sign of the World's Standard Piano Action

Tone and Touch and the Piano Action

TRUE tone! Crisp, responsive touch! With them real piano worth. Without them, merely an article of furniture. There is one certain way to obtain genuine quality in tone and touch. Insist upon the Wessell, Nickel & Gross piano action! Look for the *octagonal trade-mark*, (shown above)

Since 1874, leading piano makers have set the stamp of approval on the Wessell, Nickel & Gross action—the highest priced piano action in the world. They know by long experience that it unites every desirable piano action quality. This action is never found in instruments of doubtful worth. Piano dealers, too recognize the supremacy of this famous product. Any dealer will be glad to show you a Wessell, Nickel & Gross equipped piano, player or reproducing piano.

Teachers—Order Your "On Sale" Music Now

Now is the time to send in orders for a fall supply of teaching material. Our advice to teachers, based upon many years of experience, is to anticipate the new season's work by placing both "On Sale" and regular orders as early as possible, preferably in July and certainly before the middle of August. This insures having opportunity to become acquainted with the music before the pupils are demanding most of the teacher's time. The ability to start the season smoothly and confidently cannot exist if there has been a last minute hurried selection of material.

We make special effort at all times to give the most careful attention to individually specified needs, but "Early Orders" give us opportunity to take special care. If all teachers waited until the "last minute" to order "On Sale" music we would have difficulty in making prompt shipments, since we would not want to sacrifice careful service for speed.

Teachers who are unfamiliar with the "On Sale Plan" and its advantages are cordially invited to write for information and order blanks.

What to Play and What to Teach
By Harriette Brower

Someone has said that the books that answer questions always find a place in the world. Miss Brower's book anwers two very important questions and answers them clearly and practically. Every day the student is anxious to know what are the best things to play, and every day the teacher is trying to find out new pieces to teach. Miss Brower has gone a step further, and has picked out the best pieces from her years of experience in attending recitals in New York City, has described these pieces and arranged them in program form. The price of Miss Brower's book, if you order it in advance, is 75 cents, postpaid. You will then insure yourself that you will get one of the very first copies when the book is published.

The Value of Musical Books In the Teacher's Library

Many teachers and musicians overlook the value of a library of musical literature; unlike other professionally engaged specialists such as clergymen, physicians, lawyers and engineers, the teacher of music rarely has a representative collection of books dealing with the subjects of which he or she is assumed to have acquired the mastery. Why this should be so is a mystery in view of the fact that there are many worthy and many necessary books on musical subjects that are widely known and most of these are represented in the libraries of the more advanced teachers. Every teacher should possess several such volumes. They serve not only to broaden the teacher's mind but may be used to inspire and encourage pupils both in the studio and the home. Familiarity with what has been written in music, music teaching, musical history, etc., inevitably increases a teacher's earning capacity. It matters little what particular phase of musical activity may be of direct interest to the teacher or student of music; there are books shedding light and giving inspiration.

The vacation period in particular offers opportunities to delve into the field of musical literature; it is a good time to "brush up" and get new ideas for the next season. We shall not here attempt to give a list of such books, but we should be happy to advise and assist those who are interested in starting or extending their libraries. Much help in this direction may be found in the advertising pages of this issue.

Jolly Jingles For Little Fingers
By Helen L. Cramm

Few composers for children have been so happy in their creations as the one to whom this booklet is accredited. The way of the child student has been made a pleasant one by the publication of many such sets of pieces, so that their studies are now accomplished very largely through the medium of little pieces which vanquish the technical problems by "sugar-coating" them for the childish taste for "sweets" so that the desired end is accomplished by a charming strategy. The catchy rhythms and melodies of this collection make it especially attractive. Give the little ones a "bite" of it and they will want the whole menu.

Special advance of publication price, 30c per copy, postpaid.

Tunes For Tiny Tots
By John M. Williams

Initiating the little ones pleasantly into the mysteries of their first music lessons is the key which unlocks the Land of Success for the teachers of beginners. With this in mind, the author of this book has created out of his experience, a most interesting and valuable little volume. With the kindergarten idea in mind he has made the pages so attractive in their text and typography that the child of but a few years is beguiled into the game of feeding on their contents. The little studies and pieces, with their associated rhymes, are stimulating to the imagination of youngsters, and the teacher looking for new materials should not fail to see this book.

The special advance of publication introductory price is 30 cents per copy, postpaid.

The Etude Cover Design Contest

Elsewhere in this issue will be found full particulars regarding the Etude Cover Design Contest, which closes September 1st, 1924. The prize is $250 for the best design. Every month the Etude endeavors to present covers that will prove attractive in the thousands of music rooms to which our publication is destined. We realize that the Etude on the keyboard of the piano has the most conspicuous place in the parlor, and we endeavor to have covers that are strong, forceful, human, decorative, but always musical and educational. You may not be an artist, but you certainly have some artist friends who would be very glad to know of this contest, and we shall thank you for giving them the information.

Ten Busy Fingers Nine Melodious Studies With Rhythmic Verses For the Pianoforte
By Mabel Madison Watson

We take pleasure in announcing an excellent set of elementary studies by a well known writer. Miss Mabel Madison Watson has many successful works to her credit, in the line of easy teaching material. In this present set of studies, the rhythms are enforced by means of appropriate verses for each study. The studies are mainly in two-part harmony, but they are not contrapuntal. Miss Watson believes in what may be termed "Key-board Geography." The studies do not remain in the middle of the key-board but they work forward and backward. An opportunity is given for each hand, at some time or other, to play in either the treble or bass clefs. Each of the studies has a characteristic title: such as *There Was An Old Woman, The Mill Wheel, Spring Rain, etc.*

Our special introductory price in advance of publication is 25 cents per copy, postpaid.

Six Study Pieces for the Development of the Wrist
By Carl Moter

This work is one we can thoroughly recommend. It is musical, melodic and not at all difficult. A pupil who has finished the second or third year would be able to take up these studies and will be benefited by them. While it is called *Studies for the Wrist,* at the same time the work will be excellent as a preparation for *Bravura* study and also for expression. Some of the numbers are extremely melodic. The work will be ready for delivery during the present month and will be withdrawn from special offer.

Our introductory price in advance of publication is but 25 cents per copy, postpaid. This work will sell for more than twice this amount when put on the market.

Glee Club Songs for High School and College
By Hollis Dann and W. L. Wood

This is a book which is just what its name implies, a collection of glee songs for high schools and colleges by two well-known musicians. The work comes to us from another publisher, and in this edition quite a number of new songs have been added and some of the old ones eliminated, making this volume quite up-to-date. Since the plates are all made, the special offer will most likely be withdrawn after this month. We will only allow one copy as a sample at the special introductory price.

Our introductory price in advance of publication is but 40c per copy, postpaid.

The Cat Concert
By Russell Snively Gilbert

This is a set of little teaching pieces that cannot fail to interest young students. Each piece is characteristic of some fanciful incident in connection with our household pets. The pieces are well constructed and easy to play; they are of course very tuneful. Being printed in a large sized note with generous spacing, they will prove easy to read. The composer is a well known educator.

Our special introductory price in advance of publication is 35 cents per copy, postpaid.

New Theory Book
By Preston Ware Orem

We confidently expect that this book will be ready by September 1st, in plenty of time for the coming teaching season. To the many who have asked for a book to follow *Orem's Harmony Book for Beginners,* we will state that this is it. But, it is in reality much more. The author proceeds under the assumption that one who has studied harmony for a year or more and has acquired a knowledge of the elements of the subject, should thereafter make practical application of such knowledge by efforts in composition, the idea being to carry on the study of form and composition, hand in hand with more advanced harmony, bringing the student up to the point where the study of *Counterpoint* becomes of some real value. One who has studied this new book will have completed the ordinary course in harmony, including modulation, and will have a good working knowledge of form and of the practical application of harmony to composition. This book is just as plain and just as practical as the *Harmony Book for Beginners.*

Our special introductory price in advance of publication is 60 cents per copy, postpaid.

Reflections for Music Students
By Sidney Silber

This is a work of inspiration for the serious student. It very often happens that the entire career of a person is changed by a single maxim that has struck root. This work will contain a fund of wisdom which should be broadcasted and translated into many languages. It will be one of the most helpful volumes we have as yet published. The book will be brought out in a fine binding and with the best of paper and printing. It is one of those little books that should be on the studio table of every piano teacher that the pupil can read it while waiting for lessons.

Our introductory price in advance of publication is but 50 cents per copy, postpaid.

Basic Principles in Pianoforte Playing
By Josef Lhévinne

This is probably the last chance you will have to order this notable collection of conferences by Josef Lhévinne at the special advance price of 30 cents, postpaid. The book is so near the publication point that it should be out in a few weeks now. Mr. Lhévinne is one of the greatest authorities upon technic and interpretation of the present day.

Little Folks' Music Story Book
By James Francis Cooke

This history, with little cut-out pictures to be pasted in the book by the child, is probably the simplest and the easiest history of music ever prepared. It is intended for very small children, and has been written with the idea of making every lesson a real delight. Advance of publication price, 50 cents, postpaid.

Principles of Expression in Pianoforte Playing
By A. F. Christiani

This work is now on press, and before the opening of the season it will be in the hands of those who have subscribed in advance of publication. It is a book that should be in the library of every piano player, as it contains instruction that can be given only by the highest authority. This is proved by the reception that the book has had in previous editions. It is ranked as one of the most original works on the art of piano playing; in fact, it is considered an authority for the ambitious student and the active professional. There is no better book to be had than this one. We strongly advise the purchase of at least one copy while it is still on the special offer. The price will be doubled when it is on the market.

Our introductory price in advance of publication is $1.50 per copy, postpaid.

Rhythms for Young People
By Blanche Fox Steenman

Rhythms for Young People is a work that can be used by the private teacher or for demonstration in public schools. It contains a number of the most useful popular semi-classic piano selections used at the present day, and gives an unusual amount of material for the money. The grade of the book does not go beyond two and one-half (2½). The selections are edited in a very happy manner with annotations, but, in the main, it is in the wealth of the selections themselves that the work will stand or fall. We have confidence in this work, and look forward to a very successful career for it.

Our introductory price in advance of publication is 50c per copy, postpaid.

Reverie Album
For the Piano

A collection of drawing-room pieces of intermediate difficulty is always in demand. Our new *Reverie Album* will be made up of pieces of just this nature. They are not flashy numbers however, but are of the quiet and more refined type, such pieces as might be used for Sunday playing or at religious meetings where a piano is used. It will prove a delightful book for home playing also. Many of the best contemporary writers will be represented. These pieces are not to be found in other collections. This book will be ready very soon.

Our special introductory price in advance of publication is 35 cents per copy, postpaid.

Album of Scales
For the Pianoforte

This volume is number two in the series entitled "Study Pieces for Special Purposes." The *Album of Scales* will soon be ready. Volume One of the series, devoted to the trill which has been out for some little time, has proven very successful. The *Album of Scales* will tend to relieve materially the tedium of scale practice. The scales are introduced either in pieces or in studies which have the character of pieces. They appear in various rhythms and in connection with interesting harmonies. This book may be classified in the early Third Grade.

Our special introductory price in advance of publication is 30 cents per copy, postpaid.

Music Writing-Book
By Anna Heuermann Hamilton

This book is now ready for the press and we hope to have it out very soon. It is the best all-around writing-book that we have ever seen. It imparts in a pleasant yet practical manner a wealth of necessary elementary knowledge. This applies not only to notation itself but to other important rudimentary branches. The writer, who is an educator of wide experience, knows just what is needed in a book of this sort and it is all there. The advantages of a writing-book are many. Nothing tends to impress a fact upon the memory more than having to write it. Those who have not used writing-books in their work are advised to give this one a trial and watch for the results.

Our special introductory price in advance of publication is 20 cents per copy, postpaid.

The Fairies' Revelry
Operatic Cantata
For Treble Voices
By Richard Kieserling

For this spritely cantata of the denizens of the air, Mr Kieserling has been his own librettist, and he has given us a lovely sylphic production.

With a few accessions, this work can be properly staged and made an excellent vehicle for acting and dancing by a cast of young ladies, but its musical worth will not suffer should it be presented simply as a cantata.

We recommend this work to seminaries and music clubs as worthy of their best efforts. The time for presentation is about 30 minutes. Be sure to secure a copy at the special advance of publication price, 30 cents.

Pageant of Flowers
Operetta for Children
By Richard Kountz

Pageants are in great demand for school entertainments, and here is one that is bound to make a tremendous appeal. The music is sparkling, and the dialog and lyrics by Elsie C. Baker are admirably suited for the purpose intended. Full directions are given in the book for production and whether presented by a large or small company, the result is bound to be satisfactory. Time for performance, one-half hour.

We predict a large demand for this play and will be glad to send a copy to anyone interested at the special advance of publication price, 35 cents, postpaid.

The Awakening
A Christmas Cantata
For Treble Voices
By William Baines

In recommending this new Christmas cantata by William Baines, we have had in mind the great need of an easy, melodious work for young singers, and we feel that this cantata just fills the bill. It is scored for soprano and alto voices only, and is suitable for either Church or Sunday School presentation. The individual numbers are charming in their musical content, and the text, written by Margaret M. Trueman, tells the story of the Nativity in a truly devotional style, the finale being the grand old hymn, *Adeste Fidelis*. The solo parts are within the ability of the average singer, but can be taken as unison passages if desired. If you are looking for something to interest the junior choir for the coming season, try this cantata. This work will be off the press shortly, and the price for a single copy, in advance of publication, is 25 cents, postpaid.

The Promised Child
Christmas Cantata
For Mixed Voices
By R. M. Stults

It seems superfluous to say much regarding a new work by Mr. Stults. Choirs that have used his cantatas are perfectly willing to accept a new work bearing his name without question.

In this new cantata we have Mr. Stults at his best. From the organ pastorale, with which the cantata opens, until the finale chorus—a splendid setting of Luther's hymn, *All Praise to Thee, Eternal Lord*—there is not a dull page in this work. Time required for rendering, 40 minutes.

Choir directors and organists can secure a copy of this work at the special advance of publication price, 30 cents.

Pedal Studies for Organ
By Ernest H. Sheppard

Every organ student should have a thorough knowledge of the scales as applied to the pedals. Many students seem to think that all that is necessary is to learn the use of the toes and heels and apply this knowledge to such passages as may come up. The only way to really learn pedalling properly is to study the scales. Then one will be at home in all keys and in all parts of the pedal board. Mr. Sheppard's new book presents just the right material. Each scale is given with the proper pedalling. It is then followed by an appropriate short study piece in the same key.

Our special introductory price in advance of publication is 30 cents per copy, postpaid.

Fiorillo's Studies
For Violin

These studies have maintained their place among the classics in violin literature for over a hundred years; a genuine evidence of their universal and continued acceptance as an essential part of the violin student's training. They may be used with the Kreutzer studies, and their mastery means that the student is well along in the work of becoming a virtuoso. Our edition of this work will soon be ready and we are sure it will have a wide appeal to the serious student and teacher.

The introductory price in advance of publication is 35c a copy, postpaid.

Vision of Deborah
Cantata for Mixed Voices
By Richard Kieserling

Deborah, a prophetess and judge of Israel, was instrumental in delivering her people from the bondage of Jabin, King of Canaan, and his captain, Sisera. Mr. Kieserling has taken the story of Deborah for the subject of this cantata and has given us a musical work of power and importance.

Its availability as a splendid "between seasons" production will make it attractive to choir directors who are looking for novelties. The music is excellent, with an exotic flavor, and the solo possibilities will appeal to artists of ability.

We are confident this cantata will appear upon the programs of churches throughout the country. The special price for one copy, in advance of publication, is 30 cents, postpaid.

Notturno—A Musical Romance
By Carl Schmidt

This very attractive novel on a musical theme by a well-known teacher of New York will be ready before the summer is over. It will be a fine, cloth-bound book; a very attractive work of fiction. Our advance of publication price is only 80 cents per copy, postpaid.

Withdrawal of Advance of Publication Offers

The special advance of publication prices on the two works named below are now withdrawn.

Holberg Suite for Piano by E. Grieg, Opus 40. There are five splendid compositions by Grieg in this suite, and as these numbers are continually gaining in popularity, we have issued this new edition in the Presser Collection. The price of this edition is 75 cents.

Organ Score Anthem Book No. 2. We have taken over the publication of this volume, which enjoyed an excellent sale with the previous publisher. It contains numbers suitable for volunteer choirs, there being nothing difficult in the whole collection, but all the material is melodious and attractive. It is called Organ Score because the anthems are given somewhat in the same style that hymns are usually printed instead of upon six staves as is usually found in anthem publications. This method of printing permits a greater amount of music to be included in the volume. Price, 75 cents.

Warning

Beware of swindlers posing as subscription solicitors. The Theodore Presser Company, publishers of the Etude Music Magazine, cannot be responsible for money paid to strangers claiming to represent this company. All of our representatives carry official receipt books of the Theodore Presser Company. When money is paid by a subscriber to one of our direct representatives and it is not turned over to us, we will be responsible if our official receipt showing the date when the order was taken and the amount collected is sent to us. We caution everyone to beware of swindlers. Complaints come to us daily of our musical friends being imposed upon by a glib scoundrel with an emotional story.

Watch Expiration Date
On Your Etude Wrapper

If your wrapper shows the following:

August
1924

it means your paid for subscription expires with the August, 1924, issue. Be sure to send your renewal at once and avoid possible disappointment. The price of a year's subscription, you will recall, is two dollars, two years, $3.50. Please note the card in the upper left-hand corner of the World of Music page explaining our custom regarding discontinuances

Changes
of Address

When returning to your city address after your summer vacation, be sure to advise us, giving both your summer address and your winter address, so that no copies of the Etude will go astray.

Three Months' Introductory Offer

There is still time enough for any music lover to take advantage of our three-months' special introductory offer of Etude Music Magazine for 35c, currency or stamps. Why not give several of your friends a musical treat by introducing them to the world's most widely demanded musical magazine? The amount paid, 35c, will be credited on the regular subscription price, which is two dollars, provided order is received immediately after the last copy has been mailed.

Premium Time
Is All the Time

Note the following splendid premiums for new Etude subscriptions. Make an effort to secure one, two or three new subscriptions, select your reward and when you receive it, you will be surprised and pleased with the wonderful value received for such little effort on your part.

Berry Spoon—1 subscription.

Bread Tray—Either in oval or square design—2 subscriptions.

Crumb Tray and Scraper—Finished in hard white enamel, size of tray 9½ x 6, scraper 8½ x 3, one subscription.

Waterproof Apron—A neat and attractive, but absolutely serviceable necessity in every kitchen. Very attractive pattern. One subscription.

Child's Locket and Chain—with Pearl setting, one subscription.

Bar Pin—solid gold, with safety catch, two subscriptions.

Cuff Pins—Set of two, gold filled, chased, 1 subscription.

Friendship Pin—chased, solid gold, with safety catch, 2 subscriptions.

Friendship Pin—with four pearls, safety catch, 2 subscriptions.

The World of Music

(Continued from page 511)

The Melba Grand Opera Company is reported as being received with enthusiasm on its tour of the diva's native Australia. Think of Dame Melba, at the age of sixty-five, thrilling her audiences with the delicious strains of *Mimi*, while the voices of many of our younger singers are spent at thirty-five to forty! A difference in study and care, evidently.

Dr. Hermann Kretzschmar, one of the most noted of musical scientists, died recently in Berlin, at the age of seventy-six. His last position was as director of the Royal High School of Music.

The Music Teachers' National Association, which is to hold its annual convention in St. Louis during the last three days of December, is already busy in organizing an exceptionally interesting program with speakers of international reputation to address the different conferences.

The Centenary of the Birth of Carl Reinecke was celebrated June 23 at Leipsig, where he was so long a leading professor of the Conservatorium.

The Guilmant Organ School, organized by Dr. William C. Carl in 1899, under the presidency of M. Guilmant, of whom Dr. Carl had long been a pupil, celebrated its Silver Jubilee on June 2 with a special musical program and festivities, with M. Jules Jusserand, Ambassador of France to the United States, as a guest of honor. An honorary medal was presented to M. Jusserand. In recognition of his services in introducing French music and teaching methods to America, Dr. Carl was on June 28 decorated by the French Government as Chevalier of the Legion of Honor.

A $450,000 Guarantee Fund for the Minneapolis Symphony Orchestra has been raised in a whirlwind campaign, increasing the number of guarantors to six hundred.

Henri Maréchal, noted French composer, musical lecturer, Inspector of Musical Instruction, and Chevalier of the Legion of Honor, died recently at the age of eighty-two.

Bulletin of the Presser Home for Retired Music Teachers

On Thursday evening, June twelfth, the residents of the Presser Home for Retired Music Teachers enjoyed the rare pleasure of hearing a very delightful concert by the Smith-Spring-Holmes Orchestral Quintet, of Chicago, of which Clay Smith, the well-known song composer, is a member.

As the summer weather advances we find our better enjoyment on the comfortable verandahs and beautifully shaded lawns of the home, so that we do not feel so much the need of evening entertainment. With the return of our professional friends of the city, from their vacations, we shall again gratefully welcome their courtesies which have added so much to our past pleasures.

THE CURTIS INSTITUTE OF MUSIC

A National Institution under the auspices of the Curtis Foundation
created by Mary Louise Curtis Bok

Inaugurating its first season, 1924-1925, October 1st, 1924

A NEW SPIRIT IN MUSICAL EDUCATION

Out of many years of practical experience in musical education has come the conviction that this country needs a school of the broadest scope quite unhampered by commercial limitations. The Curtis Institute of Music is the result.

Significant endorsement of its aims is to be found in the membership of its faculty, which includes world-famous musicians who have never before cared to connect themselves with any school. General cultural training will be given by members of the faculty of the University of Pennsylvania in languages, philosophy, psychology and history. Special effort will be made to afford intellectual and artistic stimulus to the student through intimate personal contact with all members of the faculty.

It is recognized that the development of a real musician requires first of all a trained and understanding mind—next a rigid training in the elements and the technique of the musical art. Then, and then only, may follow the full flowering of true musical expression—the musician, as distinguished from the mere virtuoso.

To widen and deepen our National musical appreciation we must have more real musicians. Men and women who, whether from the nation-wide vantage of the concert platform or opera stage, or laboring quietly within the confines of their own community, shall have the scope, the vision, the completeness of full musicianship, to quicken the musical life of the whole country.

It is to the development of such musical leaders that the full resources of The Curtis Institute of Music are pledged.

THE FACULTY WILL COMPRISE A DISTINGUISHED BODY OF INTERNATIONAL ARTISTS:

Violin: Carl Flesch, Frank Gittelson, Sacha Jacobinoff, Michael Press, Emanuel Zetlin.

Piano: Berthe Bert, George F. Boyle, Austin Conradi, Josef Hofmann, David Saperton, Isabelle Vengerova.

Voice: Perley Dunn Aldrich, Mme. Charles Cahier, Horatio Connell, Marcella Sembrich, Mrs. Wood Stewart.

Opera: Andreas Dippel.

Viola: Louis Svecenski.

Violoncello: Horace Britt, Michael Penha.

Ensemble: Horace Britt, Louis Svecenski.

Orchestral Training: Michael Press, Leopold Stokowski.

DEPARTMENT OF MUSICIANSHIP

Rhythmic Training—Ear Training—Harmony: Under the direction of George A. Wedge and Angela Diller.

Composition—Musical History: Rosario Scalero.

Oratorio and Repertoire: Nicholas Douty.

ACADEMIC DEPARTMENT

Lecturers to be announced later.

PREPARATORY DEPARTMENT

Teachers to be announced in Catalogue.

Dates of Enrolment:
Preparatory Dept.: Week of Sept. 15. Conservatory Dept.: Week of Sept. 22 (Advanced Pupils).

Despite the unusual opportunities of this school, the tuition is moderate. CATALOGUE ON REQUEST.

Earn a Teacher's Diploma
or
Bachelor's Degree in Music
In Your Spare Time at Home

The teacher holding a Certificate today is the one at the top of his profession. Are you getting ahead in the music field? If not, what is the trouble? There are demands for teachers in schools and colleges, and you have a chance to qualify for the best position.

Get An Accredited Course

Many of our graduates hold good positions, as a result of our Extension Courses. Read of the progress of these graduates. (Name and address furnished on request).

One graduate writes:

> "My diplomas from your Conservatory have been recognized by the State University and a life certificate issued me. I have secured a position with an increase in salary of $50.00 a month."

Another one writes:

> "I have just been selected as director of the voice department in a Music College, as a result of my lessons with you."

Another graduate writes:

> "I was elected assistant supervisor of the grades and junior high."

One studying in New York City states:

> "I received full two-years' credit for my work with you."

The father of one of our Violin graduates says:

> "My son recently completed your course and he is playing first violin in a school orchestra and also in a 7 piece one led by his mother in Church and Community Entertainments. Advanced violin players are congratulating him on his ability as a violinist."

Study in Your Own Home with the Best Teachers in the Country

No longer is it necessary for the ambitious musical student to incur the expense of leaving home to study at an expensive resident conservatory. By the University Extension System the masters' methods are taught in the home by easily understood lessons sent by mail.

The Piano student has the marvelous teacher Sherwood to demonstrate just how he secured his incomparable effects. The Cornetist studies with the master Weldon; Crampton trains the voice of the singer; Heft shows how to interpret the soul of music on the Violin; Rosenbecker and Protheroe take the pupil through every phase of the study of Harmony; Protheroe gives his authoritative instruction in Choral Conducting; Frances E. Clark gives the most practical methods in Public School Music; Frederick J. Bacon, the great banjoist; Samuel Siegel, world-renowned mandolinist, and William Foden, famous guitarist, give their methods for mastering these instruments. The History Course, including Analysis and Appreciation of Music by Glenn Dillard Gunn, and Advanced Composition by Herbert J. Wrightson, are two advanced courses required for the Bachelor's Degree. The course in Ear Training and Sight Singing by F. B. Stiven, Director of Music at the University of Illinois, is our latest course.

More than 200,000 ambitious men and women have gained proficiency in these various branches of music by the University Extension Method. And to you we offer the same advantages which were given to them.

This Is *Your* Opportunity—Mail the Coupon TODAY!

Fill in the coupon below—send it now for four lessons and our late catalog. We will give you full details of our offer to teachers and students, and the offer calls for samples from one of the courses. Get the catalog and lessons—then decide.

TEACHERS OF PIANOFORTE

Have you ever used any of the following books for beginners in piano playing written by

JOHN M. WILLIAMS

"NOTHING EASIER" or "Adventures of Ten Little Fingers in Mother Goose Land." (Schirmer)
"TUNES FOR TINY TOTS" (Presser)
"CHILD'S FIRST MUSIC BOOK" (Schirmer)
"FIRST YEAR AT THE PIANO" (Presser)

Did you read the splendid series of articles that appeared in "THE ETUDE" for Jan., Feb., Mar., Apr., and May issues entitled "WHAT TO TEACH AT THE VERY FIRST LESSONS?"

If you have used any of these books and liked them you would enjoy and profit by joining one of Mr. Williams' NORMAL CLASSES FOR TEACHERS OF PIANOFORTE AND TEACHERS' TRAINING CLASSES FOR PIANO STUDENTS WHO WISH TO BECOME TEACHERS.

ITINERARY

CHICAGO	June 16 to June 28.
NEW YORK CITY	June 30 to July 12.
SEATTLE	July 21 to August 2.
SAN FRANCISCO	August 4 to August 16.
SAN DIEGO	August 18 to August 30.
LOS ANGELES	September 1 to September 13.
SALT LAKE CITY	September 15 to September 27.
DENVER	September 29 to October 11.
TUCSON	October 13 to October 25.
EL PASO	October 27 to November 8.
SAN ANTONIO	November 10 to November 22.
DALLAS	November 24 to December 6.
HOUSTON	December 8 to December 20.
NEW ORLEANS	January 12 to January 26.

Each Class will be of two weeks duration (daily class lessons of two hours each). Early enrollment is urged as the size of classes will be limited.

JUNIOR ETUDE

CONDUCTED BY ELIZABETH A. GEST

Musical Terms (No. 8)

THIS list was begun in the January num-
er.

Ietronome—a small instrument having an adjustable pendulum for ticking the exact length of the rhythmic beats or pulses.

Iezzo—half, or intermediate.

Ioderato—with a moderate degree of speed.

Iolto—very much.

Iordente—an ornamentation similar to two grace notes.

Iorendo—gradually subsiding or dying away.

Iosso—movement or motion.

Ioto—motion, movement.

on—not.

octurne—a dreamy, romantic composition, "night piece."

uance—variations of tone-color, power, speed, accents, and so on (frequently called "shading" or "expression").

How to Practice

By Olga C. Moore

KNOW a girl, a little girl,
Who's good as she can be.
ie stays at home most every day,
To practice carefully.

ie says, " I want to practice hard,
And learn well while I'm young,
ause when I'm grown up I will find
More things that must be done."

ie plays her scales quite evenly,
And gets the fingering right.
ie places sharps and flats just so,
She tries with all her might.

 phrase her little studies well,
And pieces, all so dear,
ie watches all the slurs and dots,
To make the meaning clear.

ow after she has practiced well
This way for several days,
ie goes up to her lesson and
Feels sure that hard work pays.

ie knows that she has done her best,
She's good as she can be.
ie stays at home most every day,
To practice carefully.

AR JUNIOR ETUDE:

I am writing this short letter to you to l you a little bit about our town. We have very fine orchestra here which, when they asked to play, supply some very fine sic. One piece they play very nicely is ampa." May be you have heard it. I ve been taking THE ETUDE since February, 20, and enjoy it very much. I am going up my intermediate music examination, so have to give THE ETUDES a rest, although till get them. My music teacher also takes m. I should be very glad to hear from ne JUNIOR friend. I have not seen any let-s from this town yet.

From your friend,
HELENE STOWELL (Age 14).
Queen St., Westport, New Zealand.

The Metronome Speaks in Self-Defense

By Ruth L. F. Barnett

"TICK, tick, tick."

I turned quickly to face the Metronome who had thus interrupted my musings. "I thought I told you not to let me hear your voice again."

"You did," returned the Metronome wearily, "you and a good many others; but I cannot allow your decision to deprive me of the privilege of doing my work."

"But your work is better left undone. Think of Jene Spieler for instance. He played with some expression before he made your acquaintance; now he plays like a hurdy-gurdy in a frightful state of repair."

"I'm not taking any blame for that," retorted the Metronome. "It means that Jene can play without stumbling as long as he can take his time over the hard spots."

"But," I argued, "his *ritardando* and *accelerando* were quite charming at times."

"And quite meaningless at others," he snapped. "Imagine a builder trying to make a house look interesting by lengthening one of the walls or putting the roof on crooked. That is what Jene would do. Of course he is trying to express what he feels, but his feelings are not a safe guide. What he needs is to develop judgment."

"How cold-blooded you are! A musician must feel."

"Nonsense! A musician must *know;* then his feelings will serve to grace and not to distort his playing."

"But how then," I asked, "is Jene to express anything?"

"Well," replied the Metronome more patiently, "there are *piano, pianissimo, mezzopiano, mezzo-forte, forte, fortissimo, diminuendo, crescendo, legato, staccato.*"

"Oh, you mean that one should strive for variety of tone and touch rather than resort to frequent changes of tempo?" I asked.

"Exactly that. One develops tone-sense by constant listening, and with more acute tone sense comes gradually the technique required to translate it. Great players often perform with a rhythmical precision that is the despair of students; yet their playing sparkles with life and freshness because of their mastery of tone-color and phrasing. No, indeed, it is not unmusicianly to play in perfect time; it is an art that is all too rare."

"What then," I asked meekly, "do you intend to do about Jene?"

"I shall still beat time for him occasionally," answered the Metronome, "but as soon as his sense of rhythm is firmly established I shall keep still so that he can listen to his playing, for then he can be trusted to attempt gradually those subtle and artistic shadings of tone and tempo that his improved judgment dictates." The Metronome sighed heavily. "Ah, how often have I been accused of making hurdy-gurdy players because students allow me to keep right on ticking until their ears become hardened to the monotony of my voice!"

"I believe I understand better now. How very wise you are, Mr. Metronome!"

"Oh well," he responded drily, "I have had more than a hundred years' experience."

Glasses

By Verne Rodermond

MANY young pianists are noted rather for their *speed* than for their accuracy. Sometimes they have neither.

Accuracy is one of the loveliest virtues of piano-playing. Now Mabel Smith, pianiste of the age of eleven, did not have this virtue. And her teacher had incessantly to caution her "*Look* at the music! You don't play one note in *fifty* right."

Mabel did not improve and one day, after the usual struggle, Mr. X. said to her jokingly: "Mabel, I think you need glasses. Then you wouldn't play so many wrong notes."

Mabel looked serious—and the next time she came for a lesson, lo and behold!—a pair of glasses! But they were very poor ones and they did not enable her to play more accurately. In fact, she played a dozen extra wrong notes that day. So Mr. X. told her that the glasses didn't seem to help, that they probably didn't fit her, and that she would much better leave them off. Which she did.

There is a kind of glass that *each of us* can put on. Its name is Care. Whoever looks at things with Care, cannot help but see correctly and well. Perhaps you play accurately. Perhaps you only *think* you do; in which case I would beg of you not to forget the Care-glass.

Summer Time No. 2

DID you read the summer-time notes in the JUNIOR ETUDE last month? And have you been doing accordingly? If so, you will find that your summer has not been wasted nor has your pleasure been interfered with. Is not this so? Keep up the summer schedule as best you can. Of course if you go away for a visit or a vacation somewhere, and there is no piano at your disposal, you will have to interrupt your schedule; but try not to let unimportant things interrupt it.

Another thing to add to your summer list is to fix up your music! Nine juniors out of ten keep their music in very bad order (and so do a great many grown-up people). DO NOT keep your music on top of the piano. You can surely find a drawer, or a shelf any way, even if you have no regular music cabinet. Sometimes the piano benches have a lid that lifts up so that under it is a good place to keep music. But please try to find a better place than the top of the piano.

Then, get to work some rainy day, and FIX IT UP. Make neat piles of the pieces you want to keep. Put all of one kind of music together; throw away some of the old, torn, dirty ones that you had when you were in the first grade. If some of the ones you are keeping are somewhat torn and frayed along the edges, get a big pair of scissors and cut off the torn edges. Get or make brown paper folders and put your sheet music in them. They are a great help in keeping the music neat and clean. If any other members of the family keep their music all mixed up, with yours, ask them to coöperate and help you in your clean up.

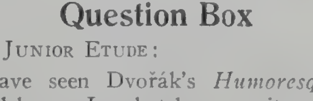
You will be ever so glad after doing this; and it will even make you enjoy your daily practice more.

Little Mary

By Marion Benson Matthews

"Mary, Mary, quite contrary
How does your music grow?"

"With a sharp and flat
And things like that,
And little notes all in a row."



Question Box

DEAR JUNIOR ETUDE:

I have seen Dvořák's *Humoresque* in several keys. In what key was it written?
—O. S. (Age 16), Kansas.

Answer.—Dvořák wrote the Humoresque in G flat, but it has been rearranged in the key of G, and is frequently played in this key, especially by violinists, as it gives them more "open strings" and is easier to finger.

DUNNING SYSTEM of Improved Music Study for Beginners

Endorsed by the Leading Musical Educators of the World

NORMAL CLASSES AS FOLLOWS:

MRS. CARRE LOUISE DUNNING, *Originator*, 8 West 40th St., New York City, August 1st, 1924.

Virginia Ryan, 940 Park Ave., New York City.
Isobel M. Tone, 469 Grand View St., Los Angeles, Cal.
Mrs. S. L. Van Nort, 2815 Helena St., Houston, Texas.
Mrs. H. R. Watkins, 124 East 11th St., Oklahoma City, Okla.

INFORMATION AND BOOKLET UPON REQUEST

RECENTLY PUBLISHED TEACHING HELPS

Many Piano Teachers Already Are Using These Meritorious New Study Works With Excellent Results

ALBUM OF TRILLS

Special Study Pieces—Vol. 1 Price, 75c

The trill is a valuable technical device in piano playing and in place of coldly presented trill studies the teacher will find these pieces utilizing the trill hold the pupils' interest while effectively developing ability to handle trills in various forms. Eighteen pieces make up this album—about six different forms of the trill appearing in them. Pupils in the medium grade can be induced to accomplish much with this excellent study help.

FROM MY YOUTH

Twelve Character Pictures for Piano

By R. Krentzlin Price, 75c

Special attention is given in these pieces to the development of style, rhythm and technic, The first of these dozen pieces start in grade two with gradual progress in later numbers to grade three. One number brings out *Clinging Legato*, others *Light Velocity*, *Rhythm Groups*, *Rhythmic Accuracy*, *Staccato*, *Triplets*, *The Trill*, etc.

25 MELODIES FOR JUVENILES

By Mana-Zucca Price, 75c

Here one of the foremost woman composers of the day has written delightful little melodies for delighting young pianists. Starting with the most easy type of a piano piece the numbers progress in a nice, gradual manner. Clever texts that aid in holding the pupil's interest accompany many of these pieces.

FIRST GRADE BOOK

By Mathilde Bilbro Price, $1.00

A very attractive work for young beginners just above the kindergarten age. It introduces practically all necessary points, including the rudiments as far as necessary, hand position, notion, etc. The material is very attractive for little tots to study and both clefs are used from the start. Miss Bilbro's elementary teaching works are so very successful because throughout they display a practical knowledge of how to interest and instruct young pupils.

FIRST PIANO LESSONS AT HOME

By Anna Heuermann Hamilton

Book One, Price, $1.00 Book Two, Price, $1.00

This is a work for very young children and each part consists of a piano instruction book and a writing book. The writing books are fine notation and time aids and the piano books help in developing playing ability. At first the pupils have very easy one hand work with accompaniments by the teachers. The second book brings both hands playing together and introduces the bass clef. This is a sensible and practical arrangement of teaching material for little tots.

STORIES NOTES CAN TELL

By Frances Terry Price, 75c

These are charming early second grade piano pieces. They are characteristic numbers that delight young players. The key variety will interest many teachers since these six short easy pieces use the keys C, G, F, and A minor.

NEW PIANO COLLECTIONS

Useful Albums That Will Serve the Piano Student in Study or Diversion

YOUNG FOLKS' OPERA GEMS

Price, 75 cents

The aim in each of these numbers has been to present a playable piano solo in a fairly easy arrangement of an opera air, frills and variations having been avoided. There are seventeen composers and twenty-three operas represented in the twenty-seven selections in this album. Most of the numbers are in grades two and three.

CONTEMPORARY MARCH ALBUM

A Collection of Military, Parade and Grand Marches for all Occasions

Price, $1.00

Excellent material for the accompaniment of drills, marches, calisthenics and other gymnastic work. There are dignified march numbers covering other needs also included in the thirty numbers making up this album. All are effective march numbers of their individual types, yet all are within the ability of the average pianist.

ALBUM OF SIX COMPOSITIONS

In Modern Style

By Charles Huerter Price, $1.00

In this set of characteristic pieces for the piano, Mr. Huerter has handled melody, rhythm and harmony in a very original but satisfying manner. We recommend these pieces to concert pianists seeking novelties and to teachers desiring new material for pupils in about the fifth grade.

THE TWO PLAYERS

Thirty-three Four Hand Piano Pieces

Price, 75 cents

An exceptional variety of four hand entertainment material is found in this album. The pieces are in the intermediate grades and there are excellent arrangements of such favorites as *Song of India*, *Czardas*, *Don Juan Minuet* and a few others, but the major portion of the numbers are melodious numbers by well-liked contemporary composers.

THEO. PRESSER CO. 1710-1712-1714 CHESTNUT ST. **PHILADELPHIA, PA.**

Junior Etude—Continued

Musical Family Complaints

By Ethel V. Moyer

"Oh, dear, oh, my!" wailed the Quarter Rest, sinking in a dejected heap in the corner. "Why will the children neglect me so?"

"What have you to complain about?" demanded Mr. Whole Note. "Only last evening when Ruth was practicing she gave me only half my value—just positively refused to count me out! Then to-day when she had her lesson her teacher had to tell her all over again that I must have my full value."

"Huh, that's nothing!" interposed little Miss Staccato Dot. "There were a whole row of my brothers and sisters dancing so gaily on Edith's page of music and she went right on as merrily as you please, never taking the least notice of us."

"Well, well, my friends why be so upset about such small matters," said Mr. Major Chord, "it was just yesterday that Hazel said I was a Minor Chord, when her teacher asked about me; but it did not affect me in the least. I still am Major Chord and will remain so till the end of my life."

"I guess you are," cried Miss Minor Chord, running in all out of breath, "they call me Major Chord sometimes, but I stamp my foot and look very sad about it until they get my name right."

At that moment little Triplet Eightl Notes came dancing in with grace an smoothness. "This seems to be the complaint bureau," said the first, with a smile "and each of you seem to think you ar treated worse than any one else. But wha do you think Henry did to us this morning You never could guess. He put the accen on my sister next to me instead of givin it to me. Then he finished us off with suc a funny little jerk that his teacher mad him count us over and over again. Afte he played us all nice and smoothly he sai he liked us very much and hoped he woul find us soon again in his piece. That mad us feel very happy and we quite forgav him for playing us badly at first."

"That doesn't make up for the way I'r neglected," sighed Mr. Quarter Rest. " am sure I come in as often as any of you and it is shameful the way the childre slight me. I shall never get over it."

"Cheer up, cheer up, my friend!" e claimed Mr. Major Chord. "The childre get us all badly mixed sometimes, but the really do not mean to do us any harm. The are just forgetful and heedless at time but I heard every one of them promise t work harder next week, so I am sure w shall be treated with more consideration."

Letter Box

Dear Junior Etude:

I have been enjoying The Etude for nearly seven years. I have studied piano and also several wind instruments. Among the instruments I play are E flat clarinet, B flat clarinet, alto horn, cornet, saxophone, valve trombone, ukulele and violin. I have not learned much on the violin yet, but expect to study it in the future. I love my music and expect to try my utmost to do credit to my musical training.

From your friend,
Phyllis Fulk (Age 15),
Texas.

N. B.—It is not often that a music pupil of fifteen can play on so many instruments. Can any other Junior reader match Phyllis? She must be a good example of what can be done by "getting to work" and not wasting precious time.

Dear Junior Etude:

I have only taken The Etude lately, but I like it very much. I play the piano and enjoy playing the pieces in The Etude. I live on a farm and I am organist for our Sunday school.

From your friend,
Lambert Dahlston (Age 12),
Kansas.

Dear Junior Etude:

I have taken The Etude for two years a at first played all the pieces, duets and viol pieces with my sister, enjoying them a gre deal; but now I have become interested reading your articles. A few evenings a I found the Junior Etude page and, beco ing interested, at once tried the puzzle whi I am sending. I have found that some your articles on playing are helping me, a as I have taken piano lessons for eight w ters it is quite interesting to see some of t things I have learned given as advice.

From your friend,
Priscilla Duncan (Age 15),
N. H.

Dear Junior Etude:

I have taken The Etude for three ye now and want to say that I like it very mu I live in the mountains all alone with D and my only companions are my dog, piano and The Etude. Sometimes I get v lonesome, and I wonder if you would ple publish my address so I can get letters fr other Junior Etude readers.

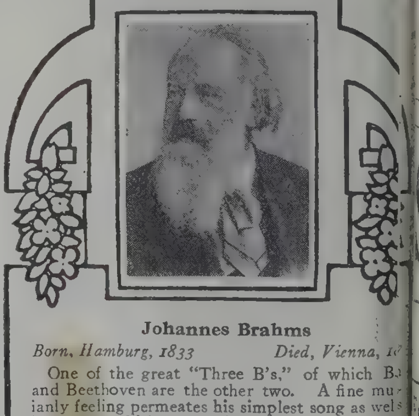
From your friend,
Herbert Miller (Age 17),
79 S. 2nd St.,
San Jose, Calif

Repetition

When you play for others, do you always play the same piece over and over again because it is your favorite, or because you are not "afraid" of it? Or do you try to vary your numbers so that the same friends do not always hear you play the same compositions?

This applies particularly to the more advanced junior readers who play frequently before people, although the audience may be only five or six friends. Suppose you have half a dozen good numbers thoroughly memorized and ready to play, and some one asks you to play for them; try your newest one or your oldest one, or one that you do not care so much for. It may turn out to be a particular favorite with your listeners. Then try to remember what you played for these people, so that when you play again you will not repeat the same pieces. If you do your friends will say, "I have heard Helen play at least six times and she always plays the same things."

Don't Forget Contests are Resumed in September



Johannes Brahms

Born, Hamburg, 1833 *Died, Vienna, 1*

One of the great "Three B's," of which B and Beethoven are the other two. A fine mu ianly feeling permeates his simplest song as wel his most ambitious symphony. One of the m scholarly of the great composers.

Quotations Furnished Cheerfully on Any Desired Combinations of Magazines.

PAUL WHITEMA

and His Orchestra

The Maestro Who Symphonized Syncopation

These World-Famous Victor Stars

use exclusively Buescher Band and Orchestra Instruments. Buescher Instruments are so flawless in scale, so perfect in tone and so accurate mechanically that

75%

of the popular Phonograph Records are played with them.

Paul Whiteman Recently Wrote:

"Buescher Saxophones match all the soft effects of the string choir, are equal to any demand in legato or staccato effect, have much more volume than the strings and a superb richness and variety of tone-color. Buescher Saxophones, Trumpets, Trombones and Basses are the finest instruments I have ever seen or heard. We use no other make at the Palais Royal, in our occasional theatrical engagements, or in our Victor Records."

BUESCHER

True-Tone Saxophones

Band and Orchestra Instruments

No other instrument of the orchestra has ever won such universal popularity in so short a time as the Saxophone, because no other instrument has that rich appealing tone and is productive of so many surprising orchestral effects.

The new Buescher Saxophone is a marvelous instrument. With the aid of the first three lessons, which are sent free (upon request) with each new Saxophone, the scale can be mastered in an hour; in a few weeks you can be playing popular music. Practice is a pleasure because you learn so quickly. You could even take a place in a band or orchestra in 90 days, if you so desired.

Buescher Band and Orchestra Instruments have helped make famous such professionals as Paul Specht, Tom Brown, Clyde Doerr, Bennie Krueger, Ben Selvin, Joseph C. Smith, Zez Confrey, Art Hickman, Clay Smith, Donald Clark, Guy Holmes, Henry Santrey, Carl Fenton, Gene Rodemich, Dan Russo and thousands of others. $100 to $500 weekly for a few hours a day is not unusual for musicians of such ability to earn.

Easy to Play Easy to Pay

Free Saxophone Book Send for a copy of a very interesting book on the Saxophone, or our complete Catalog of Band and Orchestra Instruments. Mention instrument in which you are interested.

Splendid Articles on School Bands and Orchestras

Cyril Scott on Schumann's Children's Music

Built on Master Piano Teaching Material

STANDARD GRADED COURSE OF STUDIES FOR THE PIANOFORTE

IN TEN GRADES

Originally Compiled by W. S. B. MATHEWS

UNCEASINGLY RE-EDITED, REVISED AND KEPT UP-TO-DATE BY RENOWNED TEACHING EXPERTS

The Programs of the Pre-eminent Concert Artists Show that They Find Few Substantial Modern Offerings to Replace the Works of the Celebrated Masters—

Distinguished Pedagogs Likewise Have Found No Substitutes for the Indispensable Materials Selected by Famous Educators as the Backbone of the Standard Graded Course.

"STANDARD GRADED COURSE" IS AN UNEQUALED COMPILATION OF STUDIES AND ETUDES CULLED FROM THE WORKS OF ALL OF THE WORLD'S GREATEST COMPOSERS AND TEACHERS BROUGHT TOGETHER IN LOGICAL AND PROGRESSIVE ORDER CONSTANTLY RE-EDITED AND ANNOTATED.

In addition to the imperishable studies and pieces of the past the entire field of modern thought and inspiration is carefully scrutinized for gems that will add greater value to this foremost of all teaching works for the pianoforte. The immense popularity of this course necessitates frequent printings of the different grades, allowing opportunity to keep this course "The Last Word in Musical Education."

Standard Graded Course is in ten grades, each grade being a separate volume. The aim of the work is to cultivate a high development of technic, taste and sight reading as the pupil progresses from the most elementary stages of grade one to the highest degree of virtuosity in grade ten. Teachers are invited to examine any or all of the volumes of this course.

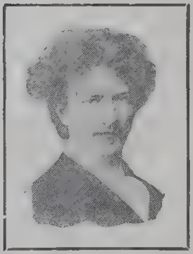
Price, $1.00 Each Grade

Dr. Wm. Mason, the Master Mind Among All American Teaching Experts was, from the Beginning, in Constant Collaboration with W. S. B. Mathews in Co-ordinating His Famous Touch and Technic With the Standard Graded Course. Complete Directions are given in Each Grade for the Application of

TOUCH AND TECHNIC

By DR. WILLIAM MASON

THE MOST STRONGLY ENDORSED OF ALL TECHNICAL SYSTEMS



"Your Touch and Technic is the best piano method which I know, and I congratulate you on being the author of so masterly a work."

I. J. PADEREWSKI

"In your method I find exercises strongly to be recommended, especially the interlocking passages and all of the accentual passages."

FRANZ LISZT

Comprises an original system for the development of a complete technic, from the beginner to the finished artist. Its distinguishing characteristics are: An active use of the pupil's mind in technical work, with the resultant rapid and thorough development; the application of accents, thus developing a true rhythm; a discriminating touch that leads to every variety of tone color and dynamic quantity, and an effective system of velocity practice that secures the necessary facility and speed of execution, all of which is applied to the artistic and expressive rendition of musical compositions. The books are all self-explanatory. Any teacher may take them up and use them at once without special training.

The value of the Principle of Accentuation applied to exercises is now so generally recognized by all teachers and virtuosi that every book of technics contains more or less of it. Nevertheless, as Dr. Mason was the original discoverer of the principle, no application of it has been so ingenious and thorough as his.

IN FOUR BOOKS—Price $1.00 Each

"Touch and Technic is, in my opinion, one of the most important works of its kind. I have read it carefully and have found features which I have not encountered in any other work on piano playing."

O. GABRILOWITSCH

- Part I—The Two-Finger Exercises (School of Touch)
- Part II—The Scales Rhythmically Treated (School of Brilliant Passages)
- Part III—Arpeggios Rhythmically Treated (Passage School)
- Part IV—School of Octave and Bravura Playing

THEODORE PRESSER CO.
Music Publishers and Dealers
1710-1712-1714 CHESTNUT STREET
PHILADELPHIA, PA.

"After the most thorough examination I consider Touch and Technic a master work which holds an unapproachable position among the most important works."

The World of Music

Mascagni is reported to be coming this autumn to conduct the American *premiere* of "Piccolo Marat." Six performances will be given in Brooklyn and a two weeks' season at the Manhattan Opera House. Nine creators of leading rôles of "Piccolo Marat" will accompany Mascagni from Italy.

The $1000 Prize offered by W. A. Clark, Jr., of Los Angeles, for an American orchestral composition has not been awarded, because a committee of judges, of international reputation, deemed that no work submitted was "of substance justifying the bestowing of a prize." This is surely an evidence of high standards for a Symphony or Symphonic Poem that will be acceptable. The competition remains open, with the date of submission of manuscripts advanced to May 1, 1925.

Max Pauer, director of the High School of Music of Stuttgart, has become the Director of the Conservatory of Leipsig.

A "Bach Society" has been organized at Geneva, Switzerland, with the design of interpreting each year some of the one hundred and ninety-nine sacred cantatas of Bach. Of these only about ten are commonly known, the others remaining in libraries. The first performance, consisting of two cantatas and a *Sanctus*, will be given in the Church of Saint-Gervais.

Three Prizes, Aggregating $1400, are offered by B. Schott's Sons, for the best "Concertos in Chamber Style" for one or more solo-instruments with accompaniment. Manuscripts, bearing a nom de plume, must be received before December first, by B. Schott's Sons, Mayence, Germany, from whom further particulars may be had.

The American Orchestral Society, of New York, which has been doing such noteworthy work in the training of young orchestral players, and of which Mrs. E. H. Harriman has been such a liberal sponsor, is planning to perpetuate its work by enlisting the interests of classes of "Sustaining" and "Associate" members. The Society Orchestra, during the past season, completed the study of thirty-five major orchestral works, gave ten programs before music-loving children of the public schools and placed seven of its graduates in leading symphony orchestras.

Motion Picture Theaters are obliged, by a decision of Judge J. Whitiker Thompson of the Federal Court of Philadelphia, to pay the publishers, who are members of the Society of Composers, Authors and Publishers, an annual fee amounting to ten cents for each seat in any theater using compositions copyrighted and issued by these publishers. The Etude and its publishers have not as yet joined with this group; and, therefore, compositions published in The Etude or by the Theodore Presser Company may be played in the motion picture theaters without fee, until further notice.

A Quarter-Tone Piano has had a demonstration at Brunswick, Germany, by the inventor, before a large group of that country's musical critics. At present the inventor advises the introduction of these quarter-tones only for special melancholy effects, till the ear has become accustomed to their use. The difficulty of keeping the delicately adjusted mechanism in tune is still a deterrent from the general adoption of the instrument.

The $1000 Prize of the Chicago North Shore Festival Association, for the best orchestral work by an American citizen, is offered again this year. Particulars may be had from Carl D. Kinsey, 624 S. Michigan Avenue, Chicago.

Cecil James Sharp, widely known as an authority on English Folk Song and Dance, and who spent a considerable time in research along this line, in the Appalachian Regions of the United States, more especially in eastern Kentucky, died recently at his home in London, at the age of sixty-four.

Paderewski has been decorated by King Albert of Belgium, with the Order of Leopold, carrying with it the rank of Grand Commander, the highest of similar honors within the gift of Belgium. During their stay in Brussels, the pianist and Mme. Paderewski were the guests of the monarch at the royal palace; and at the concert given during their visit Mme. Paderewski sat at the right of the King in the royal box.

One Hundred "Fellowships" of $1000 Each, for the study of Singing, Piano, Bow-Instruments, and Composition, are offered by the Juilliard Foundation. Particulars may be had by addressing the Secretary at 49 East Fifty-Second Street, New York. Studios and teachers for the successful entrants will be provided in New York by the Foundation.

The National Association of Organists met for its seventeenth Annual Convention, at Atlantic City, July 28 to August 1, Questions pertaining to the Organist's profession were discussed by leading authorities, recitals being given by well-known members of the American Guild of Organists, The American Organ Players' Club, The Canadian College of Organists, and the Society of Theater Organists.

Ferruccio Busoni, eminent Italian pianist and composer died in Berlin, July 27th, at the age of fifty-eight. From 1907 to 1913 Busoni was teacher of composition in the conservatory at Vienna; and since 1920 had been at the head of the composition department of the Academy of Arts of Berlin. He will be best remembered for his devotion to the works of Bach of which he was the greatest transcriber and interpreter, among pianists.

Gustav Herzberg, for fifty-three years the Philadelphia representative of the Kranich and Bach piano, a record unsurpassed in this line, in America, died recently at the age of eighty-eight. In his youth he was a pupil of Mendelssohn.

Toti Dal Monti, the young coloratura soprano from the La Scala of Milan, who has been singing with such success with the Melba Opera Company on its Australian tour, will be heard in the leading opera houses of the United States during the coming season.

Louis Victor Saar has been awarded the one hundred dollar prize offered by the Swift & Company Male Chorus for the best musical setting of "The Singers" by Longfellow or "Blow, Blow, Thou Winter Wind" by Shakespeare—Mr. Saar choosing the Longfellow poem for his composition.

"A New Patti" is the verdict of the *London Daily News*, on the debut of the young American coloratura soprano, Dusolina Giannini of Philadelphia. A curious coincidence is that the youthful cantatrice made her initial bow to "dear old London" on the forty-fourth anniversary of the first appearance before "our cousins" of Mme. Marcella Sembrich who has been her musical godmother.

An Annual Prize of One Hundred Dollars is offered by the Rubinstein Club of Washington, D. C. The competition is open to composers living south of the Mason and Dixon Line, and is for a composition for Women's voices. Address Mrs. R. H. Dalgleish, President Rubinstein Club.

The American Institute of Operatic Art, founded by Max Rabinoff, has progressed to where its cornerstone was laid July 15th, at Stony Point, New York, on the 145th anniversary of the battle fought by General "Mad Anthony" Wayne at that place in the Revolutionary War. The School is planned with the purpose of giving to young American singers the training in repertoire and routine necessary to entering upon an operatic career. The general idea is to make of the enterprise a center of American operatic art for singers, composers, dancers, scenic artists and all who have to do with operatic production.

Nightingales in a Surrey Wood have been induced to sing by sounding on a 'cello notes resembling those with which they begin their song. A sensitive microphone and amplifier transmitted the notes to a London station, from which they were broadcasted throughout England.

Felix Weingartner, until a short time ago the director of the Vienna Volksoper, is reported to have accepted a similar position at the Deutches Opernhaus of Berlin.

Johann Heinrich Beck, noted composer and violinist of Cleveland, Ohio, died May 26th. Born at Cleveland in 1856, he was a pupil of Schradieck, Hermann, Richter, Paul, Reinecke and Jadassohn. He had served as conductor of both the Detroit Symphony Orchestra and the Cleveland Symphony Orchestra. His symphonic poems have been played by many of the foremost concert orchestras of America.

"Belshazzar," in a scenic production, is to be the principal attraction at the Handel Festival to be held in September at Leipsig.

Mme. Frida de Gebele Ashforth, well known as an operatic contralto in the sixth decade of the last century, and later the teacher of Geraldine Farrar, Lucy Gates, Bessie Abbott and Sophie Braslau, died in New York on July 21st.

The "Silver Jubilee" of Spokane Musical College (Washington), a pioneer in carrying the better type of music into the Great Northwest, was celebrated by a series of important recitals on June 7, 9, and 11. Dr. R. A. Heritage, who founded the institution, still is the enthusiastic moving spirit in all its enterprises.

A William H. Humiston Memorial is planned for the MacDowell Colony of Peterborough, New Hampshire. It is to be in the nature of a building to house the valuable library of the late eminent critic who was a pupil of MacDowell. Contributions are being asked for this purpose—to be sent to the Bankers Trust Company, 25 East 57th Street, New York.

A $1000 Prize for the best Sonata or Suite for Violin and Piano is offered by Mrs. F. S. Coolidge for the annual Berkshire Festival of 1926. The Contest is open till April 1, 1926; and compositions should be sent (anonymously) to Hugo Kortschak, 1054 Lexington Avenue, New York.

The Covent Garden Season, just lately closed, brought forth seventy-nine singers in the various rôles; and, of these, twenty were British.

In the Contest for Appearances at the Stadium Concerts of the College of the City of New York, two hundred young artists entered. Of these Ignace Hilsberg, pianist; Miron Poliakin and Benno Rabinoff, violinists; Virginia Rea, coloratura soprano; Frances Paperte, mezzo-soprano; and Frank Johnson, baritone, were successful in winning a place on the programs.

Dr. Frederick Niecks, Emeritus-Professor at Edinburgh University and authority of international reputation for his encyclopedic musical erudition, and especially for his research in matters relating to Schumann's life and works, died at Edinburgh on June 24, at the age of seventy-nine.

Francesco Berger, contributor of so many inspirational articles to The Etude and other journals, celebrated his ninetieth birthday recently at his home in London.

Madam Jannasch-Shortt, a pioneer teacher of the north-middle states, and for the last forty-eight years the director of the Jannasch-Shortt Musical Institute, died at her home in Kalamazoo, Michigan, on June 25th. One of her most treasured possessions was her complete file of The Etude from 1883.

SEPTEMBER 25, 1924

Special Courses For Teachers and Advanced Students

CERTIFICATES **CATALOGS**

AMERICAN INSTITUTE OF APPLIED MUSIC

Metropolitan College of Music
THIRTY-NINTH YEAR

Piano Pedagogy Courses Lead to Certificates and Diploma

A FACULTY OF SPECIALISTS teaching Music in all its branches

Fall Term opens October 1st

SPECIAL COURSES FOR TEACHERS

For Catalogue and Circulars address
KATE S. CHITTENDEN
Dean
212 W. 59th St. New York City

College of Fine Arts
Syracuse University

MME. TINA LERNER
Piano Master Class
Six Weeks Beginning October 6th
Playing and Listening Students Admitted

VLADIMIR SHAVITCH
Master Class in Conducting
Ten Weeks Beginning October 6th

The Syracuse Symphony Orchestra Offers Four Scholarships in string instruments. For further information address Dean H. L. Butler, College of Fine Arts, Syracuse, N. Y.

Crane Normal Institute of Music

Training School for Supervisors of Music
BOTH SEXES

Voice culture, sight-singing, ear-training, harmony form, music-history, chorus-conducting, methods, practice-teaching. Graduates hold important positions in colleges, city and normal schools.

53 MAIN ST., POTSDAM, NEW YORK

30th YEAR Alviene UNIVERSITY SCHOOL OF THE Theatre

DRAMA OPERA PHOTOPLAY
COLLEGE OF STAGE DANCING

DIRECTORS
Alan Dale
Wm. A. Brady
Henry Miller
Sir John Martin-Harvey
J. J. Shubert
Marguerite Clark
Rose Coghlan

Art and science of singing. Play production. Students afforded N.Y. appearances and experience with stock players at Alviene Art Theatre. For catalogue (state study desired) write Secretary, 43 W. 72nd St., N. Y., Extension 30.

Do You Feel That You Have Musical Ideas and yet cannot express them?

It is for you that my mail course in harmony and composition is designed. For particulars address

F. L. Willgoose
Box 333 Huntington, N. Y.

The Courtright System of Musical Kindergarten

Oldest and most practical system
A great opportunity for teachers to specialize in this unlimited field. Write for particulars of correspondence course.

Mrs. Lillian Courtright Card, 116 Edna Ave., Bridgeport, Conn.

INSTITUTE OF MUSICAL ART OF THE CITY OF NEW YORK

120 Claremont Avenue, corner 122nd Street
FRANK DAMROSCH, Director

TWENTIETH SEASON *AN ENDOWED SCHOOL*

Provides a thorough and comprehensive ***Musical Education in all Branches*** and is equipped to give highest advantages to ***exceptional talents.***

Additional facilities available in ***new extension*** of building. Faculty composed of artist teachers of international reputation.

Affiliation with ***Teachers College,*** Columbia University, to provide ideal course for ***School Music Supervisors.***

CATALOGUE SENT ON REQUEST, ADDRESS, DEPT. U

VIRGIL SCHOOL OF MUSIC

Founded by the late A. K. Virgil

Originator of the Virgil Method, Inventor of the Virgil Practice Clavier

SPECIAL COURSES FOR TEACHERS, PLAYERS AND EARNEST STUDENTS OF ALL GRADES

For all particulars *address:* Mrs. A. K. VIRGIL, 510 West End Avenue, New York.

NEW YORK SCHOOL *of* MUSIC *and* ARTS

148-150 Riverside Drive **Ralfe Leech Sterner, Director**

New York's Oldest Music School

Many new and wonderful features planned for the coming season by this Institution.

Same celebrated faculty headed by Ralfe Leech Sterner, Arthur Friedheim, Paul Stoeving, Frederick Riesberg and other celebrated masters.

Individual instruction. Entrance at any time. SEVERAL FREE AND PARTIAL FREE SCHOLARSHIPS OPEN FOR COMPETITION. Dormitories in School Building. A real home for music students.

Many Free Classes and Lectures. Diplomas and Teachers' Certificates. Public Concert every Thursday night. Vocal, Piano, Violin and all Instruments. Public School Music Dept. Dramatic Art, Drawing and Painting, Dancing and Languages.

ILLUSTRATED CATALOGUE ON REQUEST

THE ETUDE

SEPTEMBER, 1924 Single Copies 25 Cents VOL. XLII, No. 9

The Three Aims of Education

The Milton Fairchild Character Education Institution, which has made a specialty of the scientific study of education in relation to Society, states the following as the three great objectives in education. Note particularly the statement as to the training of the abilities and the hands. What trains the hand more than the study of an instrument, particularly the piano or the organ in which both the bass and the treble parts must be interpreted?

Resolved, That there are three objectives of education in a republic, each of equal importance with the others.

1. The transmission of knowledge from generation to generation. The entire personnel of a nation changes in seventy years.
2. The development of abilities and skills, including health. The brain must grow strong to observe, to think, to exercise good judgment, to invent ways and means: the hands and body must learn to do things well under direction of the brain.
3. The maturing of character, according to wise standards based on human experience. The purposes of a citizen must be true, if knowledge, ability and skill are to serve the general welfare.

"Sampling" Music Lessons from House to House

A radio studio recital is a new "stunt" for the modern music school. The E. R. Kroeger School of Music, of St. Louis, has the honor of giving the first event of this kind of which we have heard. This is a unique type of musical advertising. In the olden days it was considered good publicity for the soap manufacturer to distribute samples of his wares to the doorsteps, and even now one encounters on Forty-second Street, New York, costumed employees of a Tooth Paste King handing out trial tubes. By radio, however, the music teacher may force samples of his work right into the parlor of the home without asking the *pater et materfamilias* to venture out into the night to listen to a pupil's accomplishments.

Let us hope that those who "listen in" may realize that "making music" and "hearing music" are two different and distinct pleasures. Making music of your own brings many higher and greater joys than those that come to the mere listener. As you pass the florist's window you enjoy the blossoms exposed for sale; but one poor little pansy that you have raised all by yourself will give you ten times the fun and inspiration. The pansy is yours—the orchids—well, the florist was hired to raise them.

When is a Musical Instrument Not a Musical Instrument?

At a meeting of the Philadelphia Music League recently held, Dr. Edwin C. Broome, the highly efficient Superintendent of Schools of the City of Brotherly Love, presented a letter in which he asked the board to decide whether the humble harmonica might be considered a legitimate instrument worthy of standing with the violin and the other orchestral instruments. The decision of the Board was that "the harmonica is not a legitimate musical instrument but a musical toy which has its place in boy scout camps, or in playgrounds and recreation centers where it might serve a valuable purpose."

Editorially speaking, we feel that the harmonica may have value in getting certain types of boys interested in making music. If it does no more than act as a kind of shoehorn in easing a few impossible kids into more serious musical work, it will prove worth while. Just a little while ago your editor acted as one of the judges in the city contest for harmonica players, conducted by Mr. Albert N. Hoxie, who made a reputation in wartime as a very able song leader. The Mayor of Philadelphia, W. Freeland Kendrick, was there and went upon the stage to show the boys what he could do with a harmonica and incidentally showed their elders that he was a very human Mayor. Those boys will never forget that day when the city's chief magistrate wheezed out some lively tunes in true boy fashion.

All this leads us to a very important matter in the choice of musical instruments. We have known people to work for years upon instruments that would never fit into any good orchestral group—instruments without a literature worth mentioning. The literature of the piano is immense. The literature of the violin is likewise immense. Why take up the study of the zither or some similar instrument with a comparatively restricted literature?

Shall I Go to College?

Shall I study music at a college or at a conservatory? The answer is—you must have a musical education and you must have a general education. If you do not go to college you must get your general education by far more arduous means. Of course, some virtuosi in the past have been great successes and some composers have been great successes without a college education. But what of the future?

Dr. John M. Thomas, President of the Pennsylvania State College, discussed this subject in *The Ledger* some time ago, in a striking manner. At first he covered the subject from the standpoint of the great men who have struggled to the top without collegiate help. He says:

> *"One-third of the Presidents of the United States and more than half of the group of fifty persons selected by one authority as the most successful men in American industry and business did not have the advantages of a higher education. These facts suggest the inquiry as to whether or not a college education is essential to success. Of the nine Presidents who did not attend college, four at least are numbered among the best chief executives that we have had. Washington and Lincoln, the only two Presidents whose birthdays we celebrate, and Jackson and Cleveland, whom most historians probably would place among our greatest ten Presidents, were without the background given by a college course."*

Later he points out the fact that the college does stand very high in producing successes, when compared with the great body of those who never attend college

> *"But some further considerations are necessary. We have not been fair to the colleges. College men comprise but a small proportion of the male population of the country. The wonder is that they have come anywhere near supplying one-half of what we have agreed to call our "successful" business men and two-thirds of our presidents. For, after all, a college training need not differ in great degree from the sort of diligent training that Lincoln and Edison laid out for themselves. Of equal importance to an opportunity for education is the receptiveness of the individual to be educated. Lincoln succeeded because he was Lincoln, in spite of his failure to have any definite schooling and not because of it. And the same deduction has been drawn by one who has made a study of the 23,000 names in the volume of "Who's Who in America." College men are there in higher percentage by far than their general percentage among all men.*
>
> *"More and more a college education will come to play its part in the life of the man who attains success. The men of the past generation who climbed to the topmost rung of that difficult ladder without college educations have*

sent their own sons to college. I would not venture to say that one in the present generation, fired by the fine enthusiasm of a Lincoln, could not educate himself, but I am certain that the complexity of modern life, the ramifications of the accumulated intelligence of the world and the tremendous competition in the twentieth century make it increasingly difficult for one to overcome the handicaps imposed by a failure to secure a thorough groundwork in the elements of language, science, government, history and other subjects of study."

No college possesses a philosopher's stone which will turn lead into gold or tin into platinum. The natural born fool who manages to wriggle his way through college comes out a fool. In the music field we have met numbers of them. On the other hand, many of the most brilliant and capable men of affairs in the field of music have never had college advantages. Nevertheless—get a college training if you possibly can.

Turning Eagles into Turtles

Years of close daily association with educational work, winter and summer, have given us a deep and sincere respect for the accomplishments of teachers and leaders in general. We find a great deal to laud and very little to condemn.

There is, however, a type of educator who can do incalculable damage to those he attempts to influence by his failure to realize that some people are born turtles and some are born eagles.

You simply cannot change their places in teaching music or anything else. The turtle is a turtle and always remains a turtle. He moves slowly, sleeps a great deal, progresses steadily and at the slightest danger draws back into his shell and waits there until he cautiously pokes out his head again.

The eagle soars. His home is in the highest trees on the tallest mountains. He proudly disdains the earth. His movements are swift and sure. His eyes are far-seeing and bright. He dies in close restraint.

If you find that you are giving music lessons to an eagle, why in the name of goodness not realize that he is an eagle; that he cannot stay in a technical shell like a turtle. That he must soar, or pine in captivity. Teach him how to fly, not how to crawl.

On the other hand, if you are teaching a musical turtle, remember that it is cruel to expect too much from him. He will never get very far from home. He will never grow wings. Velocity may be impossible for him. He is a turtle. Tickle his shell a little and he will clamber along at a mild pace. Do the best you can with him, but do not be exasperated if he does not soar. He has his place in the world, not as brilliant as that of the eagle, of course, but a sphere of real usefulness.

Think over this little editorial. Most of modern educational psychology is based upon the teacher's ability to diagnose the student's musical possibilities and to find out just where he stands in the scale between the turtle and the eagle.

MacDowell, The Artist

There was a time in the career of Edward MacDowell when his parents were undecided as to whether he should become a musician or a painter. MacDowell never received any lessons in drawing, but his gift in sketching portraits of his friends, in making copies of portraits of great American heroes, and in caricature, were marked by such a "professional" finish that those who have seen them readily perceive that in the development of a great musician America probably lost another Stuart, Peale, Winslow, Whistler or Sargent. The youthful MacDowell once filled an entire sketch book with drawings of a very remarkable character. Skill in the graphic arts has often been manifested by geniuses whose lives have been spent in other directions. Samuel Morse, the inventor of the telegraph, is widely recognized by art connoisseurs as one of the very foremost American painters. His canvases bring a very high price and are continually increasing in value. Some are shown in the Metropolitan Museum of Art in New York. Thackery was a very clever draftsman, as was Mendelssohn.

The Etude's Jazz Bomb

We expected that The Etude "Jazz Problem" issue in August would throw a bomb into the conservative musical camp. Sometimes the only way in which to wake people up is with a bomb. The Etude emphatically does not indorse the many coarse attitudes which have been characteristic to the worst kinds of jazz. The subject, however, demanded wide, impartial discussion. We can not be blind to the fact that from some of this music has arisen new forms of dance music orchestration which have the charm of piquancy and originality. This seems to us not unlike some of the very beautiful wild flowers which we have seen springing from a manure heap. Let us hope that all that is bad about Jazz, including the awful name itself, be annihilated and all that is charming may be retained. In this issue Mr. Clay Smith tells the real truth of the origin of Jazz. None of culture and ideals wants anything to do with that kind of Jazz. We do not, however, want to miss any new and distinctive notes that may rise through many re-incarnations from however low and maggotty a beginning. Americans are too broad to fall into the cant of despising the lowly. We take a national pride in trying to raise the status of the unfortunate. Therefore if we succeed in burying Jazz let us do so with the words:

"Corruption shall put on Incorruption."

Carlyle's University of Books

"The true university of these days is a collection of books," casually remarks Carlyle, in his "Heroes and Hero-Worship," and thus utters one of those truths crystallized for the ages.

We wish that musicians would realize this more. Does it really mean what it says?

In a great many instances the student with the genuine desire to do something can often get as much, and sometimes even more, out of a book than out of a course of University lectures. We have known of students with minds far more rapid than those of a sluggish, tired-out professor who merely parroted notes over and over again, notes prepared in his youth and never freshened. Such a student either goes down to the level of the teacher or he gets impatient, disgusted, disinterested and ultimately quits. Often he can do far more with books than with that kind of instruction.

The various reading courses that have been employed at times in different parts of the country are valuable; but the real student, the fellow who has "gumption" enough to steer his own ship, will not want a cut and dried course. He will pick his own books. He will stroll around in libraries and book shops until he can find out the needed works. He will read catalogs and advertisements until he selects what will do him the most good.

You may not be able to go to Yale, Harvard, Oberlin, Michigan, Oxford or Cambridge; but there is nothing to keep you out of the University of Books. There is no matriculation needed; and you may study as long as you desire. The cost is slight and the joy immense. You can at once join the fraternity of S. T. W. (Success Through Work), the largest and finest fraternity in the world. Any music dealer's catalog contains enough books to help you make a home-made curriculum in a short time. What if you are both faculty and student body? So were thousands of successful people who long ago distanced other students with University opportunities. Start to-day to work for your diploma from the University of Books. You will never get one; but the joy of working may bring you something infinitely more precious.

"Two things keep me up and going," said a business man to us recently, "Golf and exercise and music for inspiration. The business man who laughs at the value of music is laughing at success. Let me skip my golf or my music and I am only half a man. No one knows what this means until it is tried. There are lots of tired business men taking dope out of bottles when the real cure is in recreation. Music and golf help to re-create."

Schumann—The Master of Child Music

Written Expressly for the "Etude"
By the Distinguished English Composer-Pianist-Author

CYRIL SCOTT

Why Schumann's Music Has Had Such a Great Influence on the Education of the Young

IT is a noticeable fact that within the last fifty years a vast change has taken place relative to the education of children. The first signs of this change were already perceptible after 1836, when Froebel opened his Kindergarten school at Blankenberghe. But that the Kindergarten became a popular institution was in part due to the influence of Robert Schumann's music which began to find favor about that time; while, much later on, the Montessori[1] system was, we believe, actually inspired by that influence. It crystallized at last the realization:

(1) *That children are all different from one another and hence must be treated individually and not en masse;*

(2) *That children cannot in reality be educated by anyone else, "the impulse to learn must come from within their own minds";*

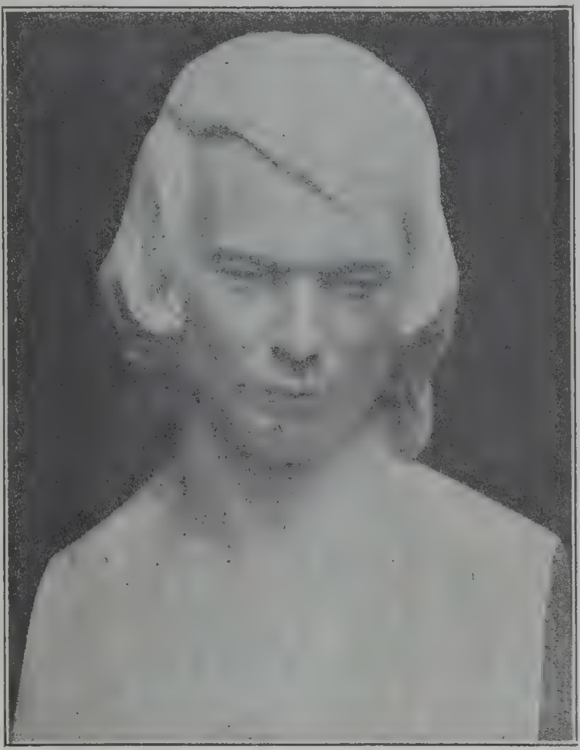
(3) *That children are so constituted that "given proper conditions they prefer educating themselves to any other occupation."*

For in these three sentences are clothed the underlying idea of that system which is more and more obtaining a hold with those who have the interests of children at heart.

"Seen and Not Heard'

But, of course, ere it was possible for such a practical measure to be introduced, let alone accepted, a marked alteration in the prevailing attitute towards children was highly essential. During the Victorian epoch not only was the treatment of the young based on a remarkable ignorance of human nature, but also on an equally remarkable, if unconscious, selfishness. Children were to be "seen and not heard"; which meant that they were to afford an ocular pleasure to adults but were not to inconvenience them by asking questions, still less by romping and making a noise. That Nature, in order to develop their lungs and muscles, requires that children *should* romp and shout, did not sufficiently occur to our Victorian forefathers; nor that they *must* ask questions in order to acquire knowledge. For young people to behave thus was not consistent with that idea of awe and reverence which ought to be observed before elders and betters! But, of course, children did romp and shout and ask questions, nevertheless; because Nature is more powerful than precept. The result very often was chastisement, justified by the wisdom of Solomon, no allowance being made for Oriental hyperbole. In a word, children were treated after the manner of criminals; they were *punished*, not *reformed*. It was for the influence of Robert Schumann to bring about that deeper love and understanding of the child, which is such a pronounced characteristic of the present age.

CLARA WIECK-SCHUMANN
When a Child Virtuoso



ROBERT SCHUMANN
From the Famous Bust by Carl Seffner in the Hamburg Music Hall

A few years ago one frequently heard the expression, "a literary painter"—it appeared to denote a man who was as much pre-occupied with the subject he painted as with the painting itself. This expression, if we mistake not, has been applied to Burne-Jones, Rossetti, Böcklin and others because they combined poetry of subject with beauty of representation. The analogy of this in the realm of the tonal art is to be found in the composer of what is termed programme-music, in contradistinction to the composer of *absolute* music. The one aims at expressing an emotion, a scene or an idea; the other is content to "express nothing but music itself."

Now although Schumann never actually wrote symphonic poems, his inspiration was more influenced by literature than that of his predecessors. One may even go so far as to say it was almost entirely nourished on the writings of Jean Paul Richter. So great was his admiration for this author "that he would become violently angry if anyone ventured to doubt or criticize Jean Paul's greatness as an imaginative writer."[2] Nor was Schumann's estimation of him unjustified; for interspersed among his interminable novels are to be found, clothed in the form of dreams, the most remarkable and grandiose prose-poems which have ever been evolved. They are cosmic in their grandeur; and Carlyle as well as Schumann was enmeshed in their enthrallment. But then Schumann was a dreamer, himself. He was also a poet in embryo; for at one time "his inclinations seem almost to have hung in the balance between music and literature."[3] As it was, the two became closely intermingled; he not only adopted the avocation of musical *littérateur*, but was also the first *literary* composer of whom there is any record.[4] With him the title of a piece was, if not an essential adjunct, at any rate an aid to its comprehension. And yet—significant fact—the piece was conceived first and the fitting title afterwards, which goes to show that Schumann, instead of circumscribing his musical inspiration by a literary idea, allowed the former to have full sway. It was, as it were, the voice of music which spoke first; it was that same voice which ultimately conveyed to him its own meaning.

The Atmosphere of Simplicity

And it is just that meaning, or rather multitude of meanings, conveyed through Schumann's vast number of pieces, from which one may gain some idea of the content of his message. That it is not so immediately apparent as that of Handel, Bach or Chopin, must be admitted; but if we approach Schumann's music with a sufficiently unprejudiced mind, *his* message is discernible none the less. In the first place an atmosphere of simplicity and innocence pervades practically the whole of his works, whether he portrays the scenes of childhood or the sentiments of adults. In the second place he entertained a noticeable predilection for simple forms—the song form, so-called, the theme and variations, and the song proper. Even his larger dimensional works, quartets and symphonies, are mostly composed of song-form sections; as for the *Carnaval* and the *Papillons*, each is a series of small pieces placed together under one composite title. It was not that Schumann did not aspire towards the more architectural type of forms in which Beethoven and Mendelssohn had excelled, it was that this inherent *simplicity* always asserted itself, no matter what he wrote. Indeed, since Domenico Scarlatti and the Clavecinists, never had a serious composer written such a prodigious number of small pieces.

If we glance through the thirty-four volumes of Schumann's works we find *Papillons* (twelve pieces), *Davidsbündler* (eighteen pieces), *Kinderszenen* (thirteen pieces), *Bunte Blätter* (fourteen pieces), *Novelletten* (eight pieces), and so on. Only now and then do we stray upon an overture, a sonata or a symphony. And then, if we study the titles, there is the same poetic simplicity, as if Schumann were deliberately naming his creations to suit the child-mind. Thus: "Scenes of Childhood," "Motley Leaves," "Butterflies," "Fairy-tale Pictures," "Fairy Stories," "Children's Ball," "Album for the Young," "Christmas Album." Again we have such significant superscriptions for single pieces, as "Why?," "Happiness Enough," "Soaring," "The Merry Peasant," and so on. Moreover, Schumann takes care to explain to his friends the meaning of some of his titles. He distinguishes the *Kinderszenen*, for instance, from the *Weihnachtsalbum*, "on the grounds that the former are the recollections which a grown man retains of his childhood, while the latter consists of imaginings and expectations of young people."[5]

The Apostle of the Romantic Movement

Schumann has been termed the Musical Apostle of the Romantic Movement. The phrase is apt enough, but with him true romance was associated with childhood, not with maturity. Himself a large, overgrown child, a dreamer, he portrayed those romantic sentiments which alone exist in the dreamland of children. Who but a big child, fond of fanciful pranks, could have conceived of and enjoyed such a strange creation as the *Davids-*

JEAN PAUL RICHTER
The Romantic Poet Who Inspired Many of Schumann's Finest Works

bündler? Here was a purely fictitious brotherhood, half-humorous, half-poetical, which existed solely in the imagination of Schumann himself.[6] It was but an elaboration of the childish fondness for assuming the characters of others, as when children exclaim: "Let's pretend to be grown-ups, soldiers," or what not. Nor can we fail to see whence Schumann's idolization of Jean Paul; for the latter "was unsurpassed in depicting the tender emotions with his dazzling and even extravagant play of digressive fancy, his excess of feeling over dramatic power, his incessant alternations between laughter and tears."[7]

Yet, withal, Schumann lacked the *power* of Jean Paul's greatest moments. When Schumann tried to be strong, he usually succeeded alone in portraying the strength of a little boy pretending to be a big one. There was always something intrinsically naive about these attempts; for if he does manage to invent a bold, clear-cut theme, as the first theme of the B♭ symphony, for example, it invariably, after a few measures, breaks off into something either playful or pleading. Another childlike element in Schumann is his predilection for telling stories, or at any rate "for bringing his hearers into a condition of mind from which they could go on romancing for themselves."[8] He has also a great fondness for musical jokes, whimsicalities and puzzles. Not only did he write six fugues on the name "Bach," but also a whole set of variations on a theme formed from the letters of a young lady's name. Further instances of this type of playfulness may be found in the *Carnaval,* in the *Album for the Young,* and in other works.

A Direct Message

In passing at length from causes to effects, we must once again emphasize the fact that music speaks its message direct to the heart—Schumann was, as it were, the messenger from the heart of the child to the heart of the parent. Nay, he was more: he was the true poet of the child-soul, of the child-nature, of the child-life. With his tenderness, his whimsicality and his humor; with his questionings, his fancifulness, his pleadings and his dreaminess; he implanted in the mother-heart the true likeness of the child; and she understood. Children were different from what she had previously thought. Her own childhood, though remembered, had taught her very little, in spite of its multitude of joys and sorrows. She had been corrected and punished, and had arrived at what she now was.

What had been good enough for her when a child, would be good enough for other children. But no—a subtle influence told her otherwise. Children were not all alike; they were as varied as adults; there was only one similarity between them—that they were all children. It was our treatment of them that made them appear all alike; we allowed them no self-expression, we trampled upon their individualities, we silenced their questionings, we never tried to understand them, to foster their latent faculties, to discover their latent talents. When they were naughty, we punished and put them to bed; but we never sought to find out the true cause of their naughtiness and wisely to remedy it. On the contrary, we resorted to the expedient of frightening, of the rod, of hell-fire, of the bogeymen. Was there no better way?

How Schumann Helped Children

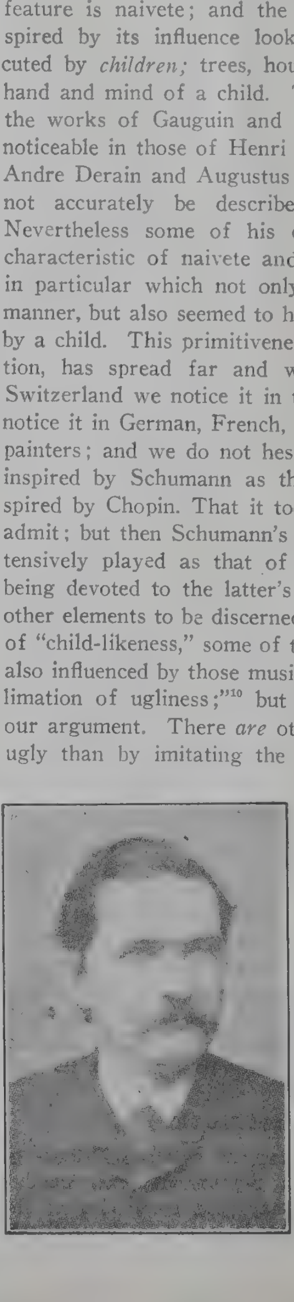
So far we have considered the effect of Schumann's music on adults; but it had a marked effect on children themselves—it helped the child-ego more speedily to reach maturity of mind. There are children born nowadays who astonish their elders by their spasmodic outbursts of wisdom. We often hear the phrase: "One could hardly believe that a child could think of such things!" This precocity is due to Schumann's influence, for, owing to the improvement in the conditions of child-life which it brought about, a much higher type of soul is able to be incarnate in the present age than in the foregoing one of blind severity.

His music[9] affected the *subconsciousness* of such souls in a manner in which none hitherto had been capable of affecting it. It was the only music so far conceived which was attuned to the child-mind and for this reason it was equally the only music capable of *educating* the child. Handel and more especially Bach were too complicated, Mozart too flowery, and even Mendelssohn and Chopin not simple enough. And yet simplicity alone was insufficient; it must needs be combined with artistic excellence. Such mediocre compositions which, owing to their simplicity, are played to or given to children to play, may be useful for *musically* educative purposes, but they do not educate the soul. Only when simplicity and true art are united can this result be achieved. The musical soul of Schumann, so to say, understood the soul of the child, and spoke to it as no other composer *could* speak . . . and he spoke to it with tenderness and love.

WINTERZEIT, OPUS 28
A Pictorial Inspiration from one of the best known of Schumann's Children's Pieces by the German Artist, Thomas Max

Schumann's Musical Pictures

Like Chopin, Robert Schumann has exercised a marked effect on the pictorial art. He was, for one thing, largely responsible for that type which in its first form was known as the *Jugendstil,* the very word *Jugend* meaning the Young. It was in evidence in the final decade of last century; but since then it has undergone development at the hands of a variety of artists. Even more has Schumann been responsible for moulding the post-impressionist painters. If we examine the spirit of Post-Impressionism, we must inevitably notice that its outstanding feature is naivete; and the drawings and paintings inspired by its influence look as if they had been executed by *children;* trees, houses, figures, all suggest the hand and mind of a child. This is already noticeable in the works of Gauguin and Van Gogh; it is even more noticeable in those of Henri Matisse, Picasso, Marchand, Andre Derain and Augustus John, though the latter cannot accurately be described as a post-impressionist. Nevertheless some of his drawings exhibit this same characteristic of naivete and the author remembers one in particular which not only was drawn in a child-like manner, but also seemed to have been "scribbled all over" by a child. This primitiveness, this simplicity of conception, has spread far and wide into all countries. In Switzerland we notice it in the paintings of Hodler; we notice it in German, French, English, Russian and Italian painters; and we do not hesitate to repeat that this was inspired by Schumann as the Pre-Raphaelites were inspired by Chopin. That it took longer to materialize, we admit; but then Schumann's music has never been so extensively played as that of Chopin, whole programmes being devoted to the latter's work. It is true there are other elements to be discerned in many of these exponents of "child-likeness," some of them in fact, like John, being also influenced by those musicians who aimed at the "sublimation of ugliness;"[10] but that does not detract from our argument. There *are* other ways of being sublimely ugly than by imitating the crude naivete of childhood.



Ferdinand Schumann, son of Robert and Clara Schumann, for whom the master wrote many of the children's pieces. Note his fine idealistic countenance in manhood.

Self-Test Questions on Mr. Scott's Article

(1) Give three cardinal principles in the teaching of children.

(2) What is a "literary painter?"

(3) Who was the first "literary composer?"

(4) What is the pervading atmosphere of Schumann's works?

(5) In what ways did Schumann help children?

The Small-Hands Pupil

By T. S. Lovette

"I HAVE a child piano pupil, and in attempting to stretch even ordinary intervals he stiffens his very small hands. What can I do to eliminate this tendency?"

It is not sufficient to suggest that you "try confining the pupil to the very simplest studies and pieces without any stretches at all"; for that would never eliminate the failing when, later, more advanced studies or pieces will be attempted.

In the first place, may I suggest that in all probability your pupil stiffens his hands even in the smallest things as the result of clinging to the keys and using the wrong pressure. Ask him to strike the key with his thumb, telling him to sustain the tone; then try to remove the thumb; and if you use the test properly you will find that member quite rigid. You are, of course, to differentiate between your pupil letting the key go when you touch his thumb, and you being able to easily remove the thumb as a result of its resting on the key in relaxed condition.

A small hand in a contracted state will limit its stretching capacity still farther, and a natural development of flexibility and stretch becomes impossible.

Very few of those who claim to know and teach relaxation are acquainted with the first principles of the subject; so, if you are among the number, get thoroughly acquainted with this important subject. True, it is but the first principle in mental-muscular movements; but application of the principles of the second step will depend entirely on the extent of your practical knowledge of the first.

Some would say that it is not possible to teach such very young students as I would deem yours to be, such interesting but intricate subjects as relaxation and weight; but the writer claims from experience that it can be done. The only difference between teaching the child and an adult is that in the case of the former all sensations must be inculcated subconsciously, for the greater part at least; whereas, detailed scientific explanations may be given the latter.

When the desired condition has been brought about then little stretching exercises may be indulged in.

Making Practice Pleasant

By Elaine E. Warren

MANY beginners in music study have a real desire to learn to play, but dislike to practice. Perhaps many who read this can recall just such a situation. To those who have not yet escaped the trials of that unfortunate state the following plan may come as a panacea.

Imagine yourself a famous musician, playing for a vast throng of admiring listeners. Imagine the "horrid scales and exercises" to be wonderful pieces of music, composed by a master. They will gradually lose their meaningless notes and become tunes. You can even give them names, to make your "play-acting" more realistic.

Give some new turn to these scales and studies each day; play them louder, softer, staccato, legato, faster, slower—any way that will be different from the day before; and thus avoid monotony.

Play each difficult part over and over before the "performance" begins. Spend the first part of the hour "rehearsing." Then, toward the last, have the real "show," and do your best.

What Touch Shall I Use in Phrasing?

By E. F. MARKS

A Much-needed Discussion of an Everyday Musical Problem

We read so frequently about the two-finger exercise in William Mason's book "Touch and Technic," that we are apt to deem that this is the only example of value to be found in this admirable book; whereas, the book abounds in copious examples of valuable technical material, sufficient to cover all grades, until a student arrives at that degree of proficiency in which he is capable of formulating his own technical exercises as needed.

No doubt the popularity of this particular exercise, very appropriately termed "the phrasing touch," received its impetus from the fact that the student of the pianoforte in America was just ready for its usefulness and application. In the old-fashioned singing schools and the simple ballads of our fathers the rhythmic accent of the measure was given prominence, and the phrasing was done by the voices, while the pianist was subordinated to simple chords or four-part accompaniment with but few opportunities allowed for instrumental phrasing. Consequently, very little attention was given to phrasing by the amateur pianist whose highest ambition at that time was to play the "Maiden's Prayer" acceptably. Besides, the current literature treated the subject of music very superficially. However, ultimately the amateur musician saw the need of phrasing in his work, and William Mason's two-finger exercise, giving directions as how to approach and leave a phrase technically, supplied the immediate demand and proved a benefice.

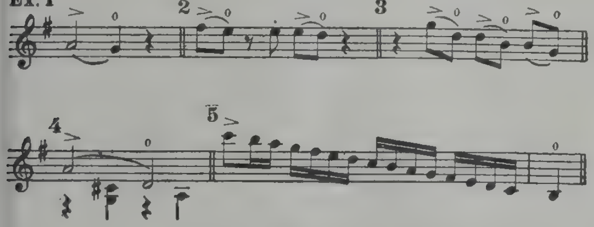
One Note Fading Into Another

However, the two-finger exercise, as played by the average student (which is to endeavor to change the fingers laterally from one adjacent key to another, thereby repeating one of the keys, and to do this as rapidly as possible) misses the intent and purpose of this exercise, as its mission is to exemplify by the first note the correct attack for the beginning of a phrase, and by the second note the correct touch to end a phrase. Anyone will observe that from such a standpoint the two touches are not confined to adjacent notes; but that many notes may intervene between the beginning and ending of a phrase, and, likewise, in a phrase of only two notes (the smallest possible phrase) these may be many degrees distant from each other.

We realize that the two notes of this exercise should be played somewhat slowly and not rapidly, if we desire to obtain the greatest benefit from our practice. After the first note has been struck we should listen intently to the naturally decreasing intensity of this sound and allow the second note to appear with a lesser degree of power, to that proportion to which the first sound has diminished. Thus is produced the effect of one note fading into another, just as one moving picture fades almost imperceptibly into another and newer one, superimposed upon it.

The following examples show the ordinary familiar forms of the touches embraced in this two-finger exercise:

Ex. 1



In the above examples the note of attack has been indicated by the > sign, and the released or diminished note by o. The > note receives the accented stroke (usually fall of the hand) and the o note a delicate finger touch finishing the phrase in a soft agreeable manner. We must not overlook the fact that a note ending a phrase is usually curtailed of some of its time value; hence, this last note is soft and short.

Example 1. Exhibits the usual feminine cadence. In the same category may be classed the resolutions of retardation and anticipation.

Example 2. Gives two phrases from Beethoven of adjacent notes.

Example 3. Also selected from Beethoven, shows three phrases of leaps.

Example 4. In this example from Tschaikowsky an accompanying chord appears between the two tones of the melodic phrase demanding the two touches. The chords of the accompaniment must not be played in a manner to detract from the interest of the melodic notes.

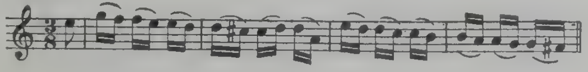
Example 5. Selected from one of Kuhlau's sonatines gives many intervening notes between the two touches. The c (second leger line above the staff, first note in the example) receives the downward (accented) stroke, and the b (second space below the staff, last note of the example) gets the final finishing touch. Notice that we have fourteen notes occurring between the beginning and the ending touches; but these notes must not interfere with the correct delivery of the touches commencing and finishing the entire phrase of sixteen notes.

Perhaps it would be well at this point to bring to notice the true import of the slur as lately emphasized; which is not simply to indicate legato playing as formerly taught, for we are told that if no other touch is indicated that legato should be used. Of late years special attention has been given to the slur, and from the former hit-and-miss manner of writing this sign implying almost nothing, even by so great a musician as Beethoven, there has emanated from this unusual attention an important rôle of the slur, which is to designate motives, figures and phrases; and this work is sometimes so carefully and accurately performed that we frequently encounter slurs written within slurs, thus clearly exhibiting the subdivisions of the longer phrases. Among these numerous subdivisions we find many opportunities to use the two-finger-phrasing-touch, as exemplified by the slurs, and the music of such masters as Haydn, Mozart and Beethoven teems with examples requiring this unexcelled touch of attack and finish combined.

A Variety of Touches

Perhaps it would be well to exemplify still further the difference of the intensity demanded by phrases for this simple two-finger exercise, and at the same time exhibit some of the obscure and mysterious guises under which it appears; and how, as we have phrases within phrases, we must have (paradoxically speaking) touches within touches, or, in other words, we must possess such an abundance and variety of touches that technical ability will show and clarify every phase of a musical phrase. In order to elucidate these differential qualities, we give a reproduction of a four-measure passage from a simple piece, "Auf Gruener Au" Op. 82, No. 1, by Gustav Merkel:

Ex. 2



According to the printed copy the phrasing marks call for the two-finger touches on adjacent notes throughout the entire transcript. However, besides this touch we will discover that others exist. If the outline of the excerpt is examined carefully, we will easily discern that the illustration naturally divides itself into two imitative sections, consisting of two measures each, constituting two phrases; the second phrase or division being two tones lower than the first with only a slight change near the end. Therefore, in the rendition of this passage our technic must show this division. To do this calls for the most careful and thoughtful manipulation of each little segment, consisting of two notes, shown by the slur, and each segment demanding the use of the two-finger touch; for each segment must be delivered softer than the preceding one, and we must augment our idea of one note fading into another, so as to include also the idea of one segment fading into another segment. Having finished the first phrase (the first divisional section of two measures), the second phrase or section must be delivered in a similar manner, yet with the conception that this second division throughout its entire length is a shade softer than the first (model) section, which is evidently the intention of the composer, as it is written lower, hence, is less brilliant. We notice that each phrase consists of six segments, each with the slight difference that the first phrase has the addition of a note preceding it. This single note beginning this first phrase must be viewed in the light of being an introductory note to the phrase, and it should be rendered in such a manner and with such a touch that it will convey this idea to the listener. In order to do this successfully it must be delivered with a softer touch and less intensity than the beginning of the real direct phrase, yet at the same time show that it belongs to and is a part of the phrase itself. As this introductory note occurs on an unaccented beat, it is not so important as when appearing on an accented one, and we can easily dispense with it and still have the idea of absolute imitation conveyed in the second phrase notwithstanding its omission.

It is owing to the introductory character of this initial unaccented note to a phrase that it is frequently omitted at the beginning of a composition, although it may be added on a reappearance of the same phrase. The first tone the ear hears is always considered as accented until this is dissipated by following accent; hence, this omission of this introductory note to a phrase is non-essential to its completeness.

According to the modern idea of phrasing in music, in this last excerpt given above, the composer should have used two slurs embracing two measures, thus defining clearly the phrases, notwithstanding the numerous slurs designating the segments requiring the phrasing touch; and the first slur should have included beneath it the initial unaccented introductory note. Thus we would have had slurs within slurs, and each demanding a different treatment by the touch. However, as the two phrases in this instance are so very apparent, we can readily forgive the writer for the omission of the two phrase-embracing slurs.

As a rule phrases in music are not so easily discernible as in the foregoing example of the repetition of a phrase in imitation. However, there is a general principle underlying the formation of phrases, which if thoroughly understood would no doubt greatly aid in discovering and correctly limiting and defining a phrase. Albeit, imitation, free and strict, figures largely in modern music writing.

Identification and Performance of Phrases

Music is poetic in construction. If a line of poetry is read it will be observed that it possesses within its bounds syllabic accents (feet) and at the end a cadential inflection of the voice. Music holds similar qualities, rhythmic accents and cadences. However, we will also observe that one line of poetry is not satisfactory to our feeling for completeness, and that it requires at the very least the addition of another line to gratify this craving for balance or entirety. Likewise, in music we find that one tone does not constitute music, as it lacks the inherent qualities (accent and cadence) of poetry; and it requires at least two tones for comparison or contrast in intensity (accent) yet from two tones we are unable to deduce a satisfactory cadential ending analogous to a line of poetry; and we find that it requires at least two measures of music to be effective and give our ear a satisfactory acceptance of accents and cadence. And just as one line of poetry does not convey the idea of repose or completeness, we realize that a phrase of music, even if it occupies two measures, still demands the addition of a second phrase. It is due to this desire for equalization that music naturally divides itself into regular rhythmic beats consisting of four, eight, twelve and sixteen measures. If we find a phrase complete in two measures, this phrase must be viewed in the light of existing as an introduction or a coda, and not as an integral part of the verse.

If we examine the usual eight measure section of any piece at hand we will discover that the phrases in order to obviate monotony and still preserve balance present one of the following basic forms:

Two long (four measures each) phrases.

Two short (two measures each) and one long (four measures).

One long (four measures) and two short (two measures each).

Of course these phrases may be shortened or lengthened, or decreased or augmented in number; but there must always be a contrast between long and short phrases, even if an entire movement is contrasted with another movement. For this reason we sometimes find long phrases predominate in a movement while the next movement will abound in short phrases. Also, we will observe that in these eight measures occur two cadential endings: one in the fourth measure, usually a feminine or half cadence, and the other in the eight measure, a full cadence, thus producing the feeling of repose and finality equivalent to two lines or a couplet in poetry. Such a passage, containing two divisions, is termed from a musical standpoint a sentence. However, in quadruple or compound time, these points of cadential ending may fall in the second, the fourth or sixth and the eighth measures.

In rendering a phrase a player should be careful to show clearly its beginning and cadential ending; and in case of an introductory unaccented note preceding it, this note should not be so prominent as to detract from the strong attack upon the accented note beginning the real phrase; as this prefatorial note is about equivalent to the definite article in spoken language. Then (unless otherwise indicated) notwithstanding the various degrees of intensity employed within the phrase, the cadential ending should be approached in a more subdued manner and ended with a quality of tone much softer than the attack at the beginning of the real phrase. If a phrase is repeated it is advisable that the same degree of power should not be used upon the repetition as in the model phrase, this to avoid monotony. However, the same expression may be given to the second appearance.

In giving the above directions concerning phrases we, purposely, have adhered to the usual and regular forms as encountered in the average pieces, and in which the outlines of form are clearly defined to embrace eight measures (or the double, sixteen measures) in order to evolve a simple basic rule for general use on how a phrase may be identified and played.

Self-test Questions on Mr. Marks' Article

1. *What has come to be known as the Phrasing touch?*
2. *What is the treatment of the note at the end of a phrase?*
3. *How many measures in music are required, to be effective?*
4. *What must a player be particular to show in rendering a phrase?*
5. *What may be said about the interpretation of repeated phrases?*

Helpful Hints on Practicing

By William Stern

PROBABLY one of the greatest reasons for music students' slow and poor progress lies not so much in the length of time they practice as in *how* they practice. Of course a great deal of the fault can be found in poor instructions and not enough practice, but the wrong kind of practice is really a student's undoing. *The one great fault.*

By the wrong kind of practice is meant practicing without making use of your eyes, ears, and head or mind.

The following suggestions and advice will show how to put these very important organs to use in daily practice.

1. Unless your *mind* is *on* what is being done your eyes may be wide open and still not see. This can easily be proved with yourself as an example. Recall your last lesson. You played wrong notes or you did not observe the proper fingering or sharps or flats, in spite of the fact that these different signs or marks were in the music, plainly printed, and, in spite of your eyes being wide open and looking right at them. Hence, your eyes will not see unless your mind directs them.

2. Right at the beginning, when studying a new piece of music cultivate the habit of reading the notes and the fingering at the same time. Very few do this. Students do not realize the importance of correct fingering. If you do not observe the fingering marked you will never properly finger music not so marked and will consequently be greatly handicapped, especially in sight reading.

3. In any piece of music certain measures are more difficult than others. There is only one way to overcome these hard places; and this is to practice these measures more than you do the rest of the piece or study. Go over the whole piece carefully. Have a pencil close at hand and as you meet a measure which you find difficult mark these places with your pencil. Then, when doing your regular practice, as you reach the places you marked, stop and give that place separate study. Go over it carefully several times with your mind concentrated on every little detail; then go on with the rest of the music and do the same with the next place you have marked. In this way these places will soon become no harder than the rest of the music. You have equalized it. That which is harder requires more practice. Practice hard places until they become easy.

4. It is assumed that your teacher has set you right as to the correct position of your hands and fingers; but they will not stay right of their own accord, not until they have been trained to do so. To train them you must watch them constantly while practicing until they do not require watching; then in time you will have a set of tools which you can command to perform any musical task.

5. Another great fault with students is, *Fast Practice.* This has a contrary effect; when you practice fast you *learn slow.* Every new piece of music, no matter if it be but an exercise or a scale, should be practiced slowly so that you will be sure to notice every little detail, such as correct reading of notes, sharps and flats, and natural signs, proper fingering, time, position of hands and fingers and other things your teacher may have marked in your music. No student can observe all this unless he is practicing slowly and has nothing else on his mind but the music.

6. A great many students have an idea that the more frequently they go over the music they are practicing the sooner they will learn it. This is decidedly wrong. If the student has been going over a page of music about five times in one half hour, and he would go over the same page of music two or at the most three times in the same length of time he would accomplish much more in spite of the fact that he would repeat the same passages only one half as many times. The reason is quite plain. In going over your music fewer times you play slower. In playing slower you are apt to make fewer mistakes. You unconsciously concentrate—that brings quicker results.

7. I am quite sure most students have been told many times by their teachers to count aloud when practicing; but how many do it? A very small percentage it is feared. However, if students would be made to realize the importance of counting aloud, and the reason for it, more would observe the teacher's advice. To be able to keep good time your ears must be trained to hear good time. By good time is meant giving the notes and rests their full and equal value and playing evenly and smoothly *not in jerks.* Now when you count aloud and you are not counting evenly (that is, counting one beat faster or slower than another) you will hear it (or should hear it if you are listening to your playing) and will correct yourself of course. In this way your ears are trained to hear good or correct time only. By counting inwardly or not at all (as so many do) you have no way of telling whether it is right or wrong; since both your ears and eyes are untrained, they cannot set you right. The metronome answers the same purpose as counting aloud, but doing it yourself is best. This is certain; you can not hope to be a good musician without being able to see and hear good time.

The Velvet Tone

By Joseph George Jacobson

WHAT is the secret of a velvet tone in piano playing? How is it acquired? Only through slow practice with a firm touch. A firm touch does not imply loud playing. The majority of pupils practice too loud, that is, with a hard, bangy touch with wrists and arms stiff.

It has been said that if you wish to play pianissimo well you must practice fortissimo. This may be true and logical; but the touch must be firm, not hard. A firm touch, with relaxed wrists and arms, equalizes the fingers; while the opposite would never strengthen them but produce a strain.

Without delicacy of touch and a velvet tone piano playing will not impress the public. Even if you are a master of giant mechanism, without heart and singing touch you will build up only cold glaciers of tones which may call for astonishment as would a skillful acrobat but will never thrill the listeners with warmth of a blissful emotion.

When you are acquiring your technic cultivate what the Germans call "Die Tonbildung des Anschlags" (the tone-formation of touch). Exercises without concentrated thought cannot help. Emotion and intelligence are the strong motors. A mechanical piano player can always beat you in speed. Listen carefully to the playing of great artists. Compare their playing. Study music for the love of it, not so much for ambition's sake, if you wish to rise above the mediocre. There is an unfortunate tendency now for artists to play more powerfully than beautifully. This "bravura" playing developes blacksmiths at the keyboard.

"MUSIC calls in my spirits, composes my thoughts, delights my ear, recreates my mind, and so not only fits me for after business, but fills my heart, at the present, with pure and useful thoughts. So that when the music sounds the sweetest in my ears, truth commonly flows the clearest into my mind."—BISHOP HENDERSON.

Runaway Warhorses

By Austin Roy Keefer

PIANISTS are sometimes caused intense vexation because a piece or particular cadenza or passage "runs away with them," so to speak. A possible and practicable remedy whereby security can be gained, is suggested.

The cause is primarily a complication of ills, namely, not knowing the text thoroughly in a mental way, and a superficial shallow touch. Here is a good place to say that a fine pianissimo or a delicate passage is a result or reward of great strength and control—never of weakness.

A good way to overcome such conditions is to select a number of cadenzas or short passages containing examples, and to concentrate upon them in an intense manner until they are perfect. The cadenzas from Liszt's *Notturno in A-flat Major,* the first cadenza in Tschaikowski's *B flat Minor Concerto,* and any works demanding the two hands working together, as Chopin's *Etude Op. 25, No. 12,* or *A flat Impromptu,* all furnish splendid studies as well as great pleasure.

In many cases the right hand runs off from the left, and when this is the case, then exaggerate all the accents and make the left hand do the leading. If a piece that you have memorized runs away with you, it is because you take it too rapidly or else because you do not think of what you are doing. The best thing to cure this fault is to resort to the notes and play very slowly, in very strict tempo, until the habit is overcome.

Turning Music Noiselessly

By Eugene F. Marks

SOMEONE may deem the turning of the leaves of a book during the rendition of a musical composition to be an unimportant matter; but when one, in listening to a chorus or orchestra, hears a disturbing rustling and rattling of paper as all turn a page at the same time, it becomes a subject demanding some attention on the part of the participants in such ensemble.

In the case of chorus singers required to turn the pages of an octave size of music sheets, a good manner is to place the palm of the right hand and fingers under the advanced page at the same time securing the edge beneath an overlapping thumb until ready to turn; of course this position of the hand must be assumed well in advance of the turning point; and when this point is reached turn the page with the entire hand, releasing the thumb-hold. If performed carefully this method of turning the leaf will produce no noise to mar the beauty of the music.

With performers in an orchestra, where the hand is employed in manipulating the keys or strings of an instrument almost incessantly, it is advisable that the pages be prepared before-hand for rapid turning by thumb-clips being placed upon the outer edges of subsequent pages, protruding a little beyond the edge of each leaf; each subsequent clip being placed about one-half inch lower than the preceding one, beginning near the top.

These thumb-clips may be made from adhesive tape or stout adhesive paper and secured in position firmly by the mucilage. By this previous preparation of the leaves it is easy to secure an opportune moment to turn the pages quickly without loss of time, and there is apt to be no fumbling of the fingers, as the eye readily catches sight of the topmost clip, which is always the one to turn the next leaf. This plan of preparing the pages for immediate turning is well adapted for use by organists or accompanists, especially when they have to turn the pages for themselves. In case the leaves of the music are not prepared by clips, each page should be slightly turned up from the lower right-hand corner before beginning to play and turned from this fold. This will obviate any mishap of turning two or more pages at the same time.

If, perchance, you are requested to turn pages for another, be careful to turn the page from the upper right-hand corner, as this enables the performer to see at a glance the first measure at the top of the new page, and, also, to still observe the lower one of the page being played. By previous preparation one should never feel any nervous excitement to hurry, whenever he encounters the command "Volti Subito" or the abbreviation V. S.

"THERE is no life so hard that music does not enter into it as a mild and healing agency. There is no intellect so beclouded that music cannot bring a ray of light into the darkened mental corners."

MAYOR HYLAN of New York.

What Effect is Jazz Likely to Have Upon the Music of the Future?

From an Interview With PERCY GRAINGER

Distinguished Pianist, Composer and Teacher in a Conference Secured Expressly for THE ETUDE, Tells Why We May Have No Fear of the Ultimate Results of Jazz on Music Art

EDITOR'S NOTE—*Mr. Grainger has easily one of the most original and individual minds of the present-day music world. His intellect has not been nourished on hackneyed thought paradigms handed down from stagnant pasts. He thinks for himself. This marks his vigorous music which seems in a way like a reincarnation of melodic and harmonic existences which expired with the England of Byrd, Tallis, Bull and Purcell. He has made a graphic study of Jazz and its influence upon the music of to-day and to-morrow. In the following brief notes he characterizes this in his customarily interesting manner. Modesty, frankness, total absence of snobbery, are Mr. Grainger's natural traits; and this makes this review of a few facts relating to Jazz all the more interesting. Compare Mr. Grainger's views with those in the "Jazz Problem" issue of last month.*

"WHAT is this bug-a-boo of Jazz? Is it polluting the musical art of to-day? Or is it something which will vastly increase the musical interest of the future? These are interesting questions, but by no means of the vital importance that some attribute to them. It was quite natural that Jazz should first bubble up in the melting pot of America, and equally natural that it should spread all over the world. The fact of the matter is that Jazz differs not essentially or sociologically from the dance music all over the world, at all periods, in that its office is to provide excitement, relaxation and sentimental appeal. In this respect it differs not from the Chinese or native American Indian music or from the *Halling* of Norway, the Tarantella of Italy, Viennese Waltzes, Spanish Dances or the Hungarian Czardas. The trouble is that too much fuss is made about Jazz. Much of it is splendid music. Its melodic characteristics are chiefly Anglo-Saxon—closely akin to British and American (white) folk-music.

The Finest Popular Music

"In speaking of Jazz, I have in mind the extremely clever jazz manipulation of popular themes with marked rhythm that has taken place in the last few years. These orchestral arrangements are often made by musicians with unusual experience. To my mind, this form of Jazz is the finest popular music known to me in any country of to-day or even of the past. Its excellence rests on its combination of Nordic melodiousness with Negro tribal, rhythmic polyphony plus the great musical refinement and sophistication that has come through the vast army of highly trained cosmopolitan musicians who play in Jazz. There never was a popular music so *classical*.

"One of the main characteristics of Jazz is that taken from the improvised habits of the Chinese and other musicians of the Far East. The seductive, exotic, desocializing elements imputed to Jazz by musical ignoramuses have no musical basis. Musically speaking, the chief characteristics of Jazz are solidity, robustness, refinement, sentiment, friendly warmth. As music it seems to me far less sensuous, passionate or abandoned than the music of many peoples. It is what one would expect from a solid, prosperous Nordic race.

"What is there new about Jazz? All of the rhythms existed before. Nothing distinctly fresh and original has been contrived rhythmically. Surely the Scotch snap, such as we find in the old Scotch tune *Comin' Through the Rye*, is not new. Yet this is one of the elements in the Jazz prescription. Nor is there anything new about the after beat, such as we find in the Hungarian dances of Brahms.

"Though the elements out of which Jazz is made are not original when taken singly, yet, no doubt, the combination of these widely diverse and highly contrasted elements is new and constitutes the originality and characteristics of Jazz.

"The music of all free peoples has a wide melodic sweep. By free I mean those people with strong pioneer elements—people who live alone in isolated stations. This accounts for the great melodic fecundity of the Nordic race. Folk who live in congested districts cannot be expected to write melodies with wide melodic range. Their melodies are restricted by the group. The group can sing just so high or so low. It has a narrow range. The compass is short. On the other hand, the Scandinavian, the Englishman, the Scotchman, the Irishman, whether he be in his native land, an American cowboy or an Australian boundary rider, is often wholly solitary in his music-making; and his melodies have, therefore, wider range of melodic line, as, for instance, in such a tune as *Sally in Our Alley* or the Norwegian *Varmlandsvisa*.

"This strong Anglo-Saxon element preserved in America was musically mixed with the equally virile rhythmic tendencies of the Negro. The Negro is not natively melodic, in the bigger sense. His melodies are largely the evolution of tunes he has absorbed from his white surroundings. His musical instinct is rhythmic first of all. (Note the Negro folksongs collected in Africa by Natalie Curtis.) To this came, doubtless, via San Francisco, about ten years ago, certain Asiatic influences which in turn were to make some of the other elements of Jazz. Oriental music is allegedly "in exact unison." A great many people play the same melody at the same time, or at least they endeavor to do so. The fact is that they rarely play quite in tune with each other and a very strange effect is achieved. Somehow this got into Jazz as an occasional discordant feature, but one which gives it unlimited individuality. Beethoven, in the *Scherzo* to his 'Pastoral,' has satirically suggested a peasant group in Europe doing the same thing. Indeed, it is a characteristic of many aboriginal groups. The Maoris, of New Zealand, when singing in alleged unison, often reveal that certain individuals are a quarter of a tone sharp or a quarter of a tone flat. The effect, especially in the distance, is far from disagreeable. There is always a kind of fuzz around the note. One hears this done deliberately in Jazz orchestras in America—of course in a more sophisticated way.

PERCY GRAINGER

"If Jazz had done nothing more than to break down certain old orchestral jail wails, it would be justified. It is in the instrumentation of the modern Jazz orchestra that the musician is principally interested. This is momentous in every way. To me it represents an advance in instrumentation only to be compared in extent with that which occurred in another line between the instrumentation of Beethoven and the instrumentation of Wagner. It has opened up glorious instrumental possibilities.

"It is amazing to me that the Saxophone, the supreme achievement of the great instrument maker, Adolphe Sax (the inventor of the bass clarinet and the perfector of the brass instruments which made many of the most beautiful passages of Wagner possible), should have to wait until this day and time to come into its own through the popular music of America. The same genius which Sax displayed with regard to wind instruments, America has displayed with regard to percussion instruments, such as the Deagan Xylophones and Marimbas, which I have prescribed for the score of my symphonic poem 'The Warriors.' This American genius, taking the instruments from Africa, Asia and South America, has given them reliable pitch so that they may be legitimately employed, both in vaudeville and with great orchestras, in extremely beautiful effects. Most of the ancestors of these new American instruments may be traced in great collections, such as the Ethnographical Museum of Leyden, Holland, or the Crosby Brown collection at the Metropolitan Museum of Art in New York.

"The Jazz orchestra has shown us how the percussion instruments add clarity to the orchestral mass. The instruments of the conventional symphony orchestra have something of a spongy character and lack the sharp, decisive qualities of the bells, xylophones and marimbas which have a clarity and sharpness, yet when well played seem to float on the mass of orchestral tone color like oil on water. The Russians have seen the possibilities of bells in their orchestral music. Bells and the percussion instruments I have mentioned cut through the tone mass but do not interfere with it. They seem to be in a different dimension of sound.

"Another great achievement of Jazz is the introduction of vibrato in the wind instruments. All wind instruments should be played with vibrato; at least as much as the strings.

Jazz Makes No Impression on Classical Music

"Apart from its influence upon orchestration, Jazz will not form any basis for classical music of the future, to my mind. The tendency will be to turn to something simpler. We are now musically located in an epoch which is not dissimilar from that which confronted the world at the time of Johann Sebastian Bach. That is, a vast horde of musical influences of great complexity seem to be coming together. Jazz is one of the manifestations of this. But Jazz is not likely to prove very fructifying to classical music. On the other hand, it has borrowed (or shall we say "purloined"?) liberally from the classical. The public likes Jazz because of the shortness of its forms and its slender mental demands upon the hearer. No music is ever really popular which is too long or too complicated. On the other hand, length and the ability to handle complicated music are invariable characteristics of really great genius. We realize this if we compare the music of Bach, Beethoven, Wagner, Delius and Tchaikowsky with the music of such fine but smaller musical talents as Scarlatti, Jensen, Roger Quilter, Reynaldo Hahn and others. Therefore, the laws which govern Jazz and other popular music can never govern music of the greatest depth or the greatest importance. I do not wish to belittle Jazz or other popular music. The world must have popular music. We should rejoice that the ragtime of ten years ago has reformed into the Jazz of to-day, but there will always exist between the best popular music and classical music that same distinction that there is between a perfect farmhouse and a perfect cathedral. The more we examine Jazz we see that its entire effect is aimed at short, sharp contrasts. There is, of course, a vast chasm between this and the Bach 'Passion Music,' the Wagner 'Music Dramas', or the Delius 'Nature Poems.' In the education of the child, Jazz ought to prove an excellent ingredient. But he also needs to drink the pure water of the classical and romantic springs. He will get plenty of Jazz in America. He cannot escape it in this day in any part of the civilized world. Last summer in Germany I noted that

Jazz had made a really noticeable impression upon the scores of the works of many modern composers I heard. The influence was superficial, but it was there, nevertheless, and it is steadily growing.

"My chief impression of the best Jazz is that it is near-perfect and delightful popular music and dance music. It is that and nothing more—and what more should it be?"

Why Chopin Used a Metronome

By T. L. Krebs

In writing about Chopin as a teacher, Carl Mikuli, an intimate friend of the master, and one of his most famous pupils, said, "In keeping time Chopin was inexorable, and it will surprise many to learn that, with him, the metronome did not come off the piano." Mozart said, "The most indispensable, hardest, and principal thing in music is the tempo," and he took pride in the fact that he always kept accurate time. Ferdinand Ries, one of the few pupils Beethoven ever taught, relates that the great master always played in perfect time, and that he insisted on strict time in others. Schumann says in his well-known *Musical House and Life Rules,* "Play in time! The playing of some virtuosi is like the staggering of a drunken man. Take not such for a model." Hummel says, "The player must strictly observe the time throughout the entire piece. The soloist is often himself at fault if he is badly accompanied even by a good orchestra." Chopin himself writes, "The left hand should be like the leader of an orchestra; not for one moment ought it to be uncertain and hesitating." Surely such men, of the highest musical authority, must be taken seriously.

No real musician will interpret the expression "playing in time" as advocating an imitation of the absolute, unwavering rigidity of a pianola performance, nor the brainless thumping of any other similar reproducing machine. Neither will he favor an habitual adherence to the beating of the metronome. At the same time the truth remains that a teacher who is unable to play in exact accord with the metronome is not competent to teach others to play in time; for, unless a player or singer thoroughly understands the rhythm of a composition and can measure with absolute accuracy the relative length of each note and rest, no matter how long or short it is, he or she cannot possibly perform a composition correctly. It is only when a performer is absolute master of time and rhythm, that he or she can take intelligent, artistic liberties with the printed notes and rests—liberties which instantly differentiate the intellectually controlled performance of the human player from any device of the pianola type.

In order to become more and more firm in properly observing the rhythm of a composition and in measuring correctly the volume of the individual notes and rests (a matter quite different from the regularly recurring musical pulsations), the greatest care on the part of both teacher and pupil is demanded. It is not sufficient that the teacher sits by and drones, "one—two—three—four," or whatever the measure beat may be. It is imperative that this counting be exact, distinct, incisive, and that the pupil should count and play exactly in unison with the teacher's counting. This does not mean that a player should always count aloud, but that he should always count. Furthermore, even the greatest players count the time of the composition they are performing, though, perhaps, not always conscious of the fact that they are doing so. One of the most distressing things to a musician is to be obliged to listen to somebody wandering and meandering through some spineless performance devoid of vitality and meaning, because of inaccuracies caused by defective rhythm. Hans Von Bülow, one of the greatest musicians and pianists who ever lived, said, "Rhythm wrong, everything wrong."

Sharps and Flats for Little Ones

By Mrs. Frank Barnes

We all know how difficult it is to impress upon small children the fact that so many of the notes read are not to be played just as they look, to them, because of the sharps or flats in the signature. I have a little method that has proven so successful that I would like to pass it on. For example, with the key of F Major, I explain to the pupil that in this scale or piece we have one key (B) who is quite above his fellows in importance, as he employs a servant (the flat) to do his work for him. I have found this a great help. The pupil likes to enlarge upon the idea that we are dealing with an aristocrat who always has an assistant.

Sight-Reading Without a Teacher

By T. S. Lovette

If you were walking along a pathway and an obstruction confronted you and you were not looking ahead, what do you think would happen? Even if you were looking ahead, and were not thinking ahead, would not the result be the same? But suppose you did both, and did not pre-act, you would still at least stumble.

It is possible to look ahead blankly.

It is possible to think of the obstruction and not prepare mentally for the act of stepping over it.

In reading music, the process is identically the same.

First, you must look ahead, if only a few notes.

Second, you must learn to recognize the notes quickly.

Third, you must mentally prepare and must pre-act on the hands or vocal chords, as the case may be.

Get someone, if you possibly can, to help you by using a visiting card, or anything else that will serve the same purpose, to cover the notes as you read them, passing the card over the notes as slowly as is necessary to permit you to read steadily, yet compelling you to look ahead, to think ahead, and to mentally pre-act. The proper terms for the entire process would be recognition, precognition, pre-action and action.

If no friend is present to assist you, try to compel yourself to apply the same system, always looking ahead. Start at a very slow tempo; for there is better mental development when the mind acts at regular periods than if allowed to stop when any little difficulty presents itself, and to travel rapidly when the reading is easy. The line of least resistance means no development, whereas the system suggested means success.

Naturally, the better you know your notes and the quicker your recognition of keys, scales and chords, the quicker will be the development; for then you will be enabled to grasp a number of notes at a glance.

Persistent and accurate practice in accordance with the foregoing instructions cannot fail to bring success.

Will You Pay the Price?

By Roy Lee Harmon

Anything worth having is worth a price.

We must pay an admission before we are allowed to enjoy an entertainment. The music student of to-day, who expects some day to enjoy the fruits of success, must pay the price. With the student this cannot be done in the twinkling of an eye. It is a protracted process. Weeks, months, years, of drudgery and self-denial must be given, for money is not the only sacrifice which must be laid upon the altar of self-development.

The modern youngster cannot live the wild, jazz-mad life and at the same time be a successful student. There must be long periods of practice, seasons of pleasant relaxation, and regular hours of sleep.

The really great musician is a poet at heart as well. He is a sensitive creature, alive to the beauties, the joys and sorrows which surround him. The virtuoso of to-morrow is not the "lounge lizard" or "candy ankle" of to-day. He whose social engagements claim much time will lack the hours for study. A true musical education cannot be acquired in a short time. Like a tiny and delicate plant it must be cultivated and nurtured carefully. Perhaps there are some who will say, "Oh, well, if I've got to give up a lot of other things in order to succeed in music, I'll let the music drop." With that as their attitude, the sooner they drop it the better; because if love of the art was a part of their being they would allow nothing to interfere.

It is a saying, though trite, that "You cannot eat your cake and have it, too," and this is but all too true. Anything great, anything at all worth possessing, is worth a sacrifice and usually demands it.

A genius is often considered "queer," or different; and he is. Why? Because he walks the heights; because he has sacrificed the foibles of the multitudes for the soul-satisfying things; and he is living a life just a little fuller than the person who is nurtured by the so-called pleasures.

The price for a musical education must be paid; but dividends will gladden the heart of yourself as well as others.

"The idea peculiar to music, the idea which music gives and which the other arts would be incapable of giving, is that of immaterial existence. . . . It presents, in short, the condition of being a being without being an object."—Julien Benda.

Teach Coöperation by the Use of Two Pianos

By A. Lane Allan

Have you thought of the use of two pianos as a good preparation in coöperative work?

A successful teacher has tried the following method of bringing about a sense of preparation in working with others. As a training in alertness it is unexcelled. Such a method paves the way for successful work as an accompanist, by keeping the pupil ready for the next note or phrase. He knows that if he does not "keep up with the procession" it means "begin again."

At the beginning of the musical year two pianos are placed in the music room in such a way that those playing do not face each other. The reason for this is that there is always someone who begins to play when he *sees* someone else begin. In this way he is made dependent upon himself for the knowledge of the proper moment to play a certain phrase or movement. He unconsciously acquires the "feel" of the proper time to do things. This, of course, is valuable later when he has no one on whom to depend when he is undecided, whether in his musical career or in other phases of his life. The music chosen is always well within the ability of all four of the pupils taking part, and is sight reading, something with which they are not familiar. The spirit of competition enters here and lends zest to the performance.

Half an hour per week of this kind of work will prove helpful. Though no charge is made, it will prove a good investment.

Carrots for a Donkey

By Sibyl Croly Hanchett

If you are a fair amateur pianist, who, for reasons of finance, occupation or situation, cannot study with a good teacher, remember the donkey and the carrot.

A certain lazy little donkey would not travel without the lure of a carrot held before his nose. His master solved the problem by an ingenious contrivance attached to his cart, which held the carrot six inches out of the animal's reach, no matter how fast he went. History fails to state, but we may hope that industry was rewarded with a juicy mouthful at the journey's end.

Pianists, as other people, are a combination of master and donkey. The driving is to be done by whip or carrot. A carrot is offered.

Here is one of the ways in which the pupil may keep a carrot enticingly in view. Play the D-flat scale, both hands, three octaves, with firm touch, smooth rhythm, no accent, watching the curve of each finger. In the same manner play the B-flat minor scale. Then D major, B minor, E-flat major, C minor and so on, progressing chromatically up the octave—each major key followed by its relative minor—without a stumble, false accent, wrong note or mistake in fingering.

Easy? Good. Do the same in sixths—fourths—fifths—with your eyes shut—accenting every fifth note. Keep adding difficulties until you meet your challenge; then practice according to the following plan:

Assume, for argument, that you are one of the many rather fair soloists who would have trouble in performing the first requirement. Observing the directions given above, start your scales at D-flat major. All goes well until you reach, say, C-sharp minor. Then you get to wool-gathering a little, or speeding beyond your limit; or perhaps this is one of those personal fiends that you have always avoided, and you make a mistake. Practice C-sharp minor until you have played it perfectly five times consecutively. It may require all of this practice period and all of to-morrow's. Do it, if it takes a week. Then start again at D-flat. Perhaps this time you will climb safely to G-sharp minor, or you may come to grief on easy D major. Wherever the accident occurs, stop and pay your penalty, five times perfectly in succession, before beginning again at D-flat.

You may not succeed for some weeks in playing the whole twenty-four scales fluently in chromatic succession. But the success, when it does arrive, is a very wholesome and juicy carrot. Munch it in peace. There are plenty more; sixths, for instance, or arpeggios, if you particularly loathe them.

In six months you will find that your technic has improved as much as if you had been guided by a good teacher; your power of concentration has developed enormously; and the fact that you have become accustomed to racing against difficulties under a slight nervous tension has greatly lessened your susceptibility to stage-fright.

Where is Jazz Leading America?

Part II of a Symposium Which Has Already Attracted National Attention

The attention of the reader is called to the last issue of "The Etude," which was devoted in part to the "Jazz Problem." In that issue there were noteworthy contributions from ***George Ade, Mrs. H. H. A. Beach, Felix Borowski, Charles Wakefield Cadman, John Alden Carpenter, Dr. Frank Damrosch, Franz Drdla, Arthur Foote, H. F. Gilbert, John Luther Long, Vincent Lopez, Will Earhart, Lt. Com. John Philip Sousa, U. S. N. R. F., Paul Whiteman, Isham Jones, Henry T. Finck,*** *and others. These, together with the following, make the most comprehensive investigation of the subject ever accomplished. "The Etude" does not endorse jazz, by discussing it. We merely endeavor to keep our readers constantly informed upon present day musical topics. Mr. Clay Smith reveals the sinister origin of jazz.*

WALTER R. SPALDING

PROFESSOR OF MUSIC, HARVARD UNIVERSITY

IN reply to your request that I send you a few words concerning the burning jazz question of the hour, it seems to me in this, as in so many other human affairs, that it is a matter of proportion.

Everyone, I think, feels the excitement and refreshment which has been brought into music by means of the new and stimulating rhythms connected with jazz and ragtime. Some of us only take umbrage when we hear the extreme devotees of Jazz say that is it the greatest modern contribution to music and is destined to supersede all other music. As a matter of fact, Jazz is a development of the rhythmical side of music, which is the most vital factor in music, but which in many ways may be considered somewhat of a negative virtue. It is taken for granted that a normal, healthy man will have a good heart beat; and it is taken for granted that good music will have rhythmic vitality and variety.

But good music must surely have many other qualities, such as melodic outline, deep emotional appeal, sublimity and ideality; and if the best that we can say of Jazz is that it is exciting, it seems to me that many of the highest attributes of music are left out. In this, however, as in many other aspects of music, the good features will gradually be incorporated into the conventional idiom, and extreme mannerisms will be eliminated; for, whatever music is or is not, it is a free experimental art and has always been developed by composers trying all sorts of new possibilities in the way of rhythmic melody and harmonic effect, the possibilities along these lines being boundless.

BOOTH TARKINGTON

FAMOUS NOVELIST AND PLAYWRIGHT

I WISH I knew enough about jazz to answer your questions with any symptoms of intelligence. I fear, however, that I cannot. I can give you my vague impressions only. I should not think jazz music the outcome of the spirit of unrest of these times. I should not think it the cause of much unrest, either. It might be considered an accompanying phenomenon, perhaps.

I do not think jazz is leading America anywhere.

I do not find myself condemning jazz; that is, not all jazz. I have heard jazz that was mere squeak and boom and holler and bang; and I have also heard jazz that seemed, perhaps, rather sensuous, but it was at least sensuously intelligible. I do not see it as the voice of new America, however. It seems to me to be purely incidental.

DR. STEPHEN WISE

RABBI OF THE FREE SYNAGOGUE, NEW YORK, N. Y.

"I AM not sure jazz is leading America. I think that jazz is one of the inevitable expressions of what might be called the jazzy morale or mood of America. If America did not think jazz, feel jazz and dream jazz, jazz would not have taken a dominant place in the music of America.

"I quite agree with you respecting the very great importance of such music as is music, the great music. The substitution of jazz for Beethoven, Bach, Wagner and Handel is no sadder than the substitution of Phillips Oppenheim or Rex Beach for the novels of my youth, George Eliot and Thackeray. Mencken is a sort of literary jazz, though perhaps a little less light-footed than jazz helps folk to be. I would not prohibit jazz or discredit it. The fear of which jazz is an inharmonious symptom is far too deep-seated for censorship or inhibitions or prohibitions. When America regains its soul, jazz will go, not before—that is to say, it will be relegated to the dark and scarlet haunts whence it came and whither unwept it will return, after America's soul is reborn."

DR. LEOPOLD STOKOWSKI

DISTINGUISHED ORCHESTRAL CONDUCTOR

THE following is reported from an address by Dr. Stokowski, before the Forum in Philadelphia:

"'Jazz' has come to stay. It is an expression of the times, of the breathless, energetic, super-active times in which we are living, and it is useless to fight against it.

"Already its vigor, its new vitality, is beginning to manifest itself.

"The Negro musicians of America are playing a great part in this change. They have an open mind, and unbiased outlook. They are not hampered by traditions or conventions, and with their new ideas, their constant experiments, they are causing new blood to flow in the veins of music. In America, I think, there lies perhaps the greatest hope in the whole musical world.

"In France today there are many clever musicians, most outstanding of whom are Debussy and Ravel. In England a school is growing steadily, and shortly it will burst into bloom like a flower. But though there is much talent, the world is still in the throes of a big unrest, for which it is striving to find expression. There is no great spirit, no great genius, such as Wagner, dominating the world of music at the present time.

"With the very complex music of today, an interpreter is a very important factor. The composer creates a work. The interpreter re-creates it and breathes life into it and makes it a living pulsating, vibrating thing. He it is who must co-relate the instruments, the different kinds of phrasing and the various types of technic and make plain to the public that which, unaided, it could not understand or appreciate.

"Art is going to develop in the future, speedily and in multiple forms. There will be no prohibition going on in music. There is going to be greater and greater variety, because it is going to reach more and more persons. Music is going to enter more and more into our lives and become a part of our philosophy."

ROBERT M. STULTS

COMPOSER OF "THE SWEETEST STORY EVER TOLD," ONE OF THE MOST SUCCESSFUL SONGS EVER WRITTEN—REPUTED TO HAVE SOLD OVER 3,000,000 COPIES DURING THE LAST THREE DECADES

I HAVE expressed myself so frequently on this subject, in casual conversation, and in such a vehement manner, that it will be rather difficult for me to put my opinion in public print, and leave out certain expletives. It is hard to talk about this "mongrel" music and keep calm.

For years past I have watched the gradual deterioration of the so-called popular music of the day. In the modern dances this is particularly noticeable. I don't object to the dances as such, for I have always enjoyed dancing; but the infernal racket that usually accompanies them, and the monkey shines of some of the performers, are enough to give even a musician of my type a chronic case of "jim-jams."

One cannot help comparing the dance music of thirty years ago with the travesties of the present day. Think of the stately old lancers and quadrilles, the dreamy waltzes of Waldteufel and the inspiring Strauss numbers! And then contemplate the "rot" that we are obliged to "hop around to" today. Recall, if you are old enough, the well-balanced dance orchestras of the old days, and then listen to the combination of fiddles, banjos, saxophones, scrub-brushes and tom-toms that are now in vogue. Shades of Terpsichore! happy are ye that your ears cannot hear the pandemonium that now reigns!

This jazz epidemic has also had its degenerating effect on the popular songs of the day. In fact, nearly every piece of dance music we now hear is a re-hash of these often vulgar songs. But I am optimistic! There is every indication that the ballad of the past, with its strong heart appeal, is again coming into favor. This is strongly indicated by the number of love songs that have recently sprung into popularity. I may be pardoned if I mention "The Sweetest Story Ever Told," a song written thirty-two years ago, and which during the past two years has seemingly taken on a new lease of life, the sales now approaching the 3,000,000 mark. Another happy sign is the fact that publishers are demanding more and more songs of a higher and more refined sentiment; and publishers are not given to printing music that the people do not want. "Jazz" has created a "malarious" atmosphere in the musical world. It is abnormal. The air needs clarifying!

CLAY SMITH

WELL-KNOWN CHAUTAUQUA PERFORMER AND COMPOSER OF MANY SUCCESSFUL SONGS

IF the truth were known about the origin of the word "Jazz" it would never be mentioned in polite society. I have seen many quotations from active-minded musicians who have guessed at the origin of the term but they are far from the facts. Thousands of men know the truth about the ancestry of "Jazz," and why it has been withheld is hard to tell.

When I was a boy in school, some thirty-five years ago, I played the trombone and it did not take long in those days for me to get the reputation of being a prodigy. At fifteen and sixteen I had already made tours of western towns including the big mining centres when the West was really wild and woolly. Those were hard rough settlements and many of the men were as tough as mankind ever becomes. Like all adolescent boys let loose on the world I naturally received information that was none too good for me and was piloted by ignorant men to dance resorts which were open to the entire town. These dance resorts were known as "Honky-Tonks"—a name, which in itself suggests some of the rhythms of Jazz. The vulgar word "Jazz" was in general currency in those dance halls thirty years or more ago. Therefore Jazz to me does not seem to be of American negro origin as many suppose.

The primitive music that went with the "Jazz" of those mining-town dance halls is unquestionably the lineal ancestry of much of the Jazz music of to-day. The highly vulgar dances that accompany some of the modern Jazz are sometimes far too suggestive of the ugly origin of the word.

I know that this will prove shocking to some people but why not tell the truth. "The Truth is mighty and will prevail." "Jazz" was born and christened in the low dance halls of our far west of three decades ago. Present day "Jazz" has gone through many reformations and absorbed many racial colors from our own South, from Africa, the Near East and the Far East. But why stigmatize what is good in the music by the unmentionably low word "Jazz?"

If I were to get upon the platform and merely repeat some of the utterly horrible scenes that were forced upon me at those "Jazz" resorts during those boyhood tours, any respectable audience would be petrified. Do you wonder that the very name "Jazz" is anathema to me!

Having played high-class music with the Smith-Spring-Holmes Company, in some three thousand engagements in Chautauqua and Lyceum, which have taken me to the remotest parts of the country, I have heard so-called modern Jazz of all kinds. Who can help it?

Some of the modern Jazz arrangements are strikingly original and refreshing, with an instrumentation that is often very novel and charming. Music of this kind is far too good and far too clever to slander with the name "Jazz." It is very American in its snap, speed, smartness and cosmopolitan character. Why not call it "Ragtonia" or "Calithumpia" or anything on earth to get away from the term "Jazz." But, even the best of this entertaining and popular music has no place with the great classics or even with fine concert numbers, except perhaps in a few cases where musicians of the highest standing, such as Stravinsky, Carpenter, Cadman, Guion, Grainger, Huerter and others with real musical training, have playfully taken "Jazz" idioms and made them into modernistic pieces of the super-jazz type.

FRED STONE

Famous Comedian-Dancer
President of National Vaudeville Artists

The following is part of an interview printed in the New York *Times*. Mr. Stone traces the origin of Jazz to a ragtime piece known as *The Pasmala*.

"I can't remember where I first heard *The Pasmala*. The name is a corruption of the French, 'pas a mele,' which means 'a mixed step.' That is exactly what it was—a step generally done backward, the dancer, with his knees bent, dragging one foot back to the other to broken time; a short, unaccented beat before a long accented one, the same principle now used in jazz and known as syncopation.

"I first heard ragtime in New Orleans about 1895. It was in a cafe, and there was a little negro at the piano. He would play one of the standard songs of the day, such as 'Mary and John,' and then he would announce: 'Here's the new music, the way us plays it,' and he would break into ragtime. I'll never forget the way that negro chased himself up and down the keyboard of that piano. He was doing, or trying to do, everything that the eccentric jazz orchestra did three or four years ago.

"Ben Harney, a white man who had a fine negro shouting voice, probably did more to popularize ragtime than any other person. Harney, who was playing in Louisville, heard the new music, and he grew so adept at it that he came to New York and appeared in the Weber & Fields Music Hall. Of course, ragtime may have started here before Harney; there were numbers of wandering musicians playing in saloons and cafes in those days; but credit is due him because he played in a first-class theatre before any other ragtime exponent.

"Always the dances were done in the new jiggity time, and they influenced clog, straight jig, Irish reel, Irish jig, soft shoe and the George M. Cohan styles of footwork. Every one was dancing ragtime, and the motif was to be found in the original buck dancing. The dancers worked close to the ground, and few of them would lift a foot the height of the knee from the floor unless they were doing an acrobatic step—a kinker dance, we called it.

"About this time Bert Jordan, who is now playing in 'Stepping Stones,' was regarded as one of the best flat-foot dancers in the country. He used to develop his material from sounds. He was at first a snare drummer, and he'd sit in his dressing room thumping an old drum until he got a succession of sounds that pleased him, and then he would work it out with his feet. When he had the original combination going smoothly, he would do it again in doubles—putting in two steps and two sounds where he had originally one. Then he would do it all over again in triples—three steps and three sounds where he had one. The dancers worked to catch the ear as well as the eye. Many of them could dance without any music, making pleasing rhythmic sounds with their feet.

"All this took practice, plenty of it, for a dance had to be good. There was no such thing as a pretty good dancer, because engagements were limited, and a dancer who could not dance as well as the best was crowded out. Work was scarce enough for the best ones, and they were constantly traveling about the country. And all of this dancing lasted long after ragtime had its first big flare-up. What caused it to go out was the introduction of foreign stuff, such as splits, adaptations of Russian steps, jumps over the foot and all those things.

"Whenever the talk turns to American music and American dancing, I always wonder if there is any music or dancing more thoroughly American than syncopation and what we at first called ragtime. I do not pretend to say that this music originally was anything but what it was—the creation of illiterates. But it was spontaneous, and as thoroughly original, though in another mood, as the so-called songs of the South which might have been inspired by negro chants.

"If jazz develops into a form accepted as music, there will be interest a century hence as to its origin. That means if it is generally accepted that *The Pasmala* was the first ragtime song, that Ernest Hogan, an almost forgotten minstrel, will be hailed as the founder of the new American music."

GEOFFREY O'HARA

Well-Known Community Song Leader, Composer

Jazz is teaching America new tone colors in orchestral instruments. It is interesting the whole nation in rhythm, in melody, in keeping time. It is establishing the first principles of music in everyone (call it noise—what is music but beautified noise; call it rhythm—what is music but ordered and beautified rhythm?)

Jazz has been an entering wedge for millions who had not taken the first step in music. Jazz has met them half way. Jazz is a mediator and advocate, a great go-between, a sort of theatrical announcer, a herald of better things, a jester.

Jazz is knocking at the door of the Temple of Music. Old Dame Muse will open the door. Even now I hear her shuffling old feet and the creaking of that rusty old door of tradition. It will soon open. Jazz will be conducted to take its rightful seat in the Hall of Fame where it will be taught etiquette.

PAUL SPECHT

Well-Known Conductor of Successful Orchestras

Where is jazz leading America? I can best answer this by making a reply to the jazz critics and old learned professors and the like, who continually splurge into the press in fits, declaring that "jazz music is like whiskey; a powerful stimulant with a depressing reaction." Another critic says, "the body throws off the poison alcohol, but jazz is lasting," and so on.

Well, briefly, if you refer to jazz of the past, noisy, slam-bang style, the critics have a good fair reason to shout, but if you or I refer to the present-day jazz music, I prefer to think of it as "rhythmic symphonic syncopation," a particular brand of music fit for the ear and fit for the feet; in other words, it sounds as pleasing as it feels to the feet of the dance enthusiast; something that is elevating instead of degrading. Many letters received by me in my recent essay contest on jazz confirm this.

This symphonic syncopation was founded by scholars like Bach and Brahms, and so, by adding a good share of spicy rhythm we define *modern American dance music*, the greatest of musical educators of the masses our art has ever known. Do you realize that this form of music is a forceful stepping stone to stimulate interest in the study of music; a step of musical development, distinctly American, that is teaching the public to better appreciate our big symphony orchestras?

The radio and the phonograph have proven big factors in this development. In our smaller towns and cities where the small five or six-piece jazz band used to be the rage, today they are grouping into ten to fifteen-piece dance orchestras, imitating what they hear from the top-notch dance orchestras who broadcast over radio regularly; or often they take a phonograph record and play it over, observing all the musical arrangement, color, phrasing and detail that some famous orchestra leader has either paid big money for or else he has lain awake nights to think of some new novelty or embellishment to retain his supremacy amidst a competition that is rapidly bringing this unique native development to the fore. In other words, this so-called and grossly misunderstood "American Jazz" has probably equalled the American dollar as the American trademark of notoriety in Europe, Asia and even Africa. It has rapidly spread to the four corners of the world.

Now, then, if this form of music is like that critic's whiskey, with a lasting effect, then I prefer the stimulant, although I am not a drinker, since I am convinced that modern dance music occupies a permanent place in the development of America's progressive spirit and it has proven a welcome and effective stimulus, taking the place of liquor, banned by prohibition.

A Jazz "Characterization"

In a recent article, the widely-read music critic, Mr. Gilbert Selden, in *Arts and Decoration*, has given a distinctly clever characterization of Jazz, and from it we quote:

"Among the lively arts, jazz is at present the most promising. It is hard, precise and unsentimental. It is not sloppy, it is self-assured, it is never dull. . . The jazz of ten years ago was impudent and mocking. . . Whiteman and Lopez preserve the lightness of spirit, transferring the jokes to the musical instruments and to the transformations in tempo which they make.

"The orchestra as now constituted exploits the banjo and saxophone, which, it is surprising to learn, were absent from the original jazz bands. In reality the characteristic of the modern jazz band is its deficiency in strings, made up by the diversity in wood-wind, exuberance of brass, and the utilization of the saxophone family, which has the ambiguous quality of wind and brass, of reedbell. That constitution is suitable enough for dancing: If the jazz orchestra ever becomes a concert body, the strings will have to be enlarged.

"Jazz is roaring and stamping and vulgar you may say; but you can not say that it is pale and polite and dying. . . . . The strength, the touch upon common things, the hold upon common emotions, the almost rapturous freedom, the carelessness, the lack of dignity, the very vulgarity, if you insist, of jazz are treasures beyond price in a world which is busy with business and a society corrupted by false ideas of politeness and gentility in the arts. Jazz at least is mastering its machine instead of allowing itself to be enslaved. It will not sacrifice music and it will possibly create music."

Would Mozart Write Fox-Trots If He Lived To-day?

The following from Mr. George Vail, of the well-known Meyer Davis Orchestra Organization, intimates that jazz is the folk music of America. At the same time Mr. Davis is widely advertising that he will give a prize of $100 for a name for our distinctive American dance music that will not carry the stigma of jazz.

All great national schools of music have been built on the songs and dances of the common people. Such folk-music, while a very humble form of art, is the indispensable raw material from which masterpieces are fashioned. Great composers have universally recognized this indebtedness and the greatest among them have not considered it beneath their dignity to compose songs and dances in the popular style of their day. It has remained for American purists to profess unbounded contempt for contemporary dance music, familiarly known as "jazz," and in the same breath to deplore the absence of a distinctively national school of composition.

Most of the crudities of "jazz," are due to an utter lack of interest, on the part of our austere academicians, in an idiom which, whatever its cultural shortcomings, is American through and through. Mozart, Haydn and Chopin, were they alive today, would write fox-trots as naturally and inevitably as they once composed gavottes, minuets and mazurkas. The perfection of these now classic dance forms, which in their unpolished state were the "jazz" of their day, may be attributed largely to the ennobling influence of such masters. We have it in our power to achieve similar results to-day; but nothing can be accomplished until we drop our present attitude of superiority and take an intelligent interest in our own popular music.

The average level of the latter could be lifted considerably if it were possible to disseminate more widely a knowledge of the elementary principles of musical form. One has only to listen to the great majority of popular dance melodies to become convinced that few of the composers in this field possess technical skill sufficient for the proper construction of sixteen-bar choruses. Since most of them are capable instrumentalists their musical illiteracy must be laid at the door of the teaching profession. Five minutes of every lesson period devoted to a simple analysis of the compositions studied would speedily remedy this appalling situation and the gain to music would be enormous.

Give Muscles a Thought

By Rena I. Carver

The director of a gymnasium gave a little advice to a new class, which has been adapted for music pupils:

Try not to overdo. Do not take heavy exercises or weightlifting every day. Do them every other day and on intervening days practice something entirely different. In other words, play fast-velocity studies and something light.

Be sure to warm up and become thoroughly supple before heavy exercises, for it is dangerous suddenly to exert a cold and stiff muscle.

If you perspire much while practicing, drink a glass or two of water (not too cold) at any time. That restores to the system the moisture that you have lost, and refreshes you.

It is well to practice the hands separately because the mental concentration is greater; the movement is usually better executed and danger of overdoing lessened. In alternate exercising use the weaker hand first so it will get best attention. If there is much difference, give the weaker one special exercises. But in learning a new exercise or an unfamiliar one, use the stronger hand, as that lessens the danger of strain; and if a strain should occur it gives the weak one a chance to catch up with the other instead of falling farther behind.

Use complete movements. Short, unfinished movements, especially when accompanied by a heavy strain, gradually diminish the muscles' latitude of action and tend to a cramped, "muscle-bound" condition.

In testing yourself do not do your best at the first trial. Set the metronome at about one-quarter of your speed to make sure that positions are correct and to warm the muscles. Rest a few moments, then try about one-half your speed. Rest again and try three-quarters of your limit. Next, do your best on the feat you are aiming at.

Never hold your breath in any exercise for more than a few seconds. Take four or five deep inspirations between movements—while the muscles are resting.

Next month THE ETUDE presents the first of a notable new series of important articles upon Piano Playing, by the famous Russian Virtuoso, Mark Hambourg.

Instrumental Music in Public Schools

By GLENN H. WOODS, A. A. G. O.

Director of Music, Oakland, California

Mr. Glenn H. Woods' Success with the Orchestras and the Bands in the Public Schools of Oakland, California, Has Attracted Nation-Wide Attention. His Methods Have Literally Brought About a Revolution in Certain Phases of Musical Education

FEW are the cities that have not responded to the popular demand for instrumental music in the schools. The evolution has been natural, steady and secure, developed by the increasing interest in instrumental music through Symphony Orchestras and Concert Bands. Every city of any commercial importance has at least one Symphony Orchestra listed among its advertised achievements.

Instrumental music is of itself its best salesman. It has a variety of tone color in the four choirs of sound that appeals to the auditory senses. Its harmony is triplicated in three different sections of the orchestra and reënforced by the fourth; it has height and depth, force and delicacy, tragedy and tenderness, so that no sentiment within the gamut of human emotions is left untouched by the tone color and technic of pure sound that emanates from an orchestra. Small wonder, then, that instrumental music has finally penetrated the confines of the elementary as well as the high school.

The boys and girls of today are the men and women of tomorrow; and as taste, culture and refinement become needs of the daily life in mature years, the appeal to these tastes cannot be applied too soon. Music appreciation has acquired considerable vogue in recent years; and those who can perform and participate in musical production are the more apt to have a highly cultivated degree of appreciation. American boys and girls have just as much innate musical instinct as the boys and girls of any other nation. We of America, however, have been concerned too largely with the elements that provide for "making a living." Having succeeded admirably in this undertaking, the time is now propitious to add to our accomplishment the elements that presage the tastes we evidence in the life we live.

Music for Everybody

Music is by no means a subject which only the elect can acquire. The average boy and girl shows marked ability in all phases of musical technic, when that instruction is available and they are exposed to its mysteries(?). Their voices are quite above the average and respond quickly and permanently to vocal training; piano and instrumental technic offer few obstacles that they cannot master; harmony is not a closed book nor an unwelcome study; they grasp its principles quickly and need only to be well taught to be able to acquire its use.

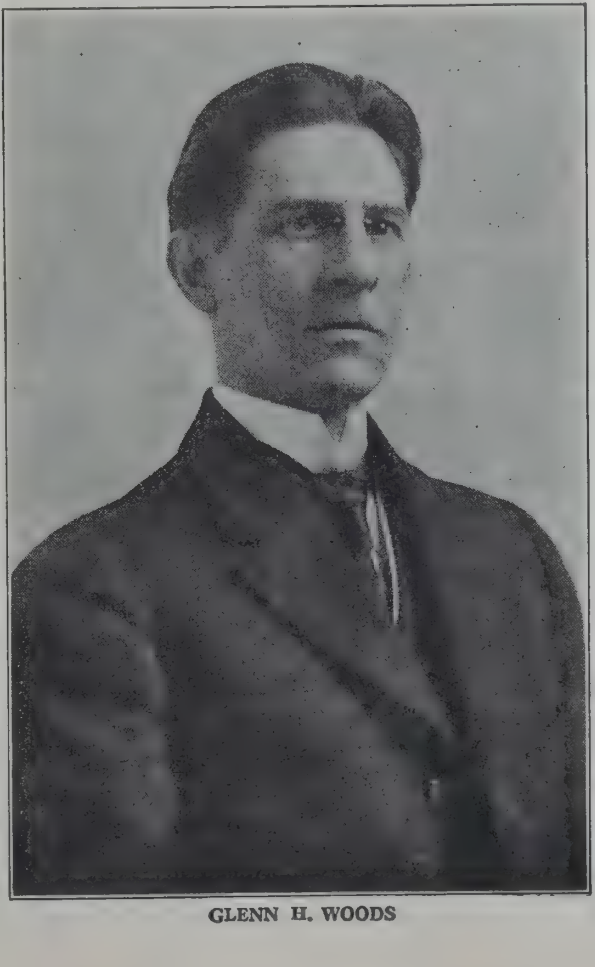
Orchestration and arranging hold no terrors for high school students. Orchestral tone and instrumentation are already almost a daily association, and this acquaintance makes easy the approach to the goal of thinking pitch in different qualities and quantities. So music in any of its diversified phases can be assimilated by the American boys and girls if instruction is available.

Educators have been slow to recognize the educational value of the subject; for few of them have ever had any appreciable training or experience in the subject.

Music has acquired some recognition in the educational program; but it has not yet received the endorsement that guarantees the momentum of success it can develop if the endorsement were more of a conviction in its potentialities rather than resignation in behalf of an experiment. President Eliot (Emeritus) of Harvard stated that: "Music, rightly taught, is the best mind-trainer in the group." The educational leaders heard but did not heed; for experience in the subject aroused no reciprocal conviction as to the merit of the statement. Music has had to ferret out its own course in the schools and adjust itself to established procedure dating back many years. Despite this handicap it has grown, expanded and acquired a permanency that augurs well for its future achievement.

"If the child be more than his information we shall not neglect his taste"—(*Developing Mental Power*—P. 70—George Malcolm Stratton). Does music develop the artistic taste of the child? Is the element of taste in art, literature and general culture influenced at all by such music as may come within the experience of the child in his school years?

Music for so long a time has been considered a fad by the majority of educators that the layman is frequently inclined to question its real intrinsic value. To aid the layman and others who may still question its value, may it be said that music is the most universal of the arts, and those who frequently derive the most pleasure from it have little knowledge of the subject and regret it exceedingly.



GLENN H. WOODS

The child is the man in the making and music should be part of his equipment. It will never do him any harm and may do him much good. This is a certainty beyond a doubt, so let us proceed to the ways and means of accomplishment.

Every child spends a large part of his first eighteen years in school. His music and school work must progress simultaneously or one or the other be neglected if not entirely abandoned. If he possesses musical ability of a marked degree the school studies are usually sacrificed, with a permanent educational deficit to the child. If music be to his dislike he is most certain to face later a regret that music instruction was discontinued at a time when mind and muscle were retentive and pliant. Very few persons acquire facility in any drill subject after twenty years of age. The concert artists now before the public were masters of technic on their chosen instruments while still in their teens. It is imperative, then, that music be part of the instruction received during the school years and for that reason it should be part of the curriculum of the school.

All progressive school systems have music in some form, but it is more frequently confined to singing. In the last decade, however, instrumental music has attracted considerable attention and many cities have incorporated it in the program. This particular phase of music usually appeals to boys; and music for boys is the theme of this missive.

The Teacher

Taste in art, literature and music can be acquired. The average boy of average intelligence, with good teaching, can learn to play almost any instrument and produce therefrom material sounds that are quite above the average. The unusual instruments of the orchestra, such as the oboe, bassoon, French horn, string bass, flute and clarinet, fall easy prey to the nimble fingers and alert minds of the bright-eyed, vigorous American boys, and they derive no small pleasure from being able to make the "thing do stunts." If the boy can do it, and he can, he should be given the chance to do it.

The first move in this decision must be made by the Superintendent. If he says instrumental music is to be taught in the schools, the first hazard is passed and the fairway looms clear for a long drive.

The instructor is the first consideration. Good performers are not always good teachers, and *vice versa;* but a good teacher must know how to perform on orchestral instruments, if success is to attend the undertaking.

The violin is, of course, the major instrument to be considered; but that does not guarantee that the woodwind choir will receive correct attention unless the instructor knows something about that section. Then the brass should not be neglected and most of all the drum section. Let us look at the different instruments in the orchestra and investigate the problem from a practical standpoint.

The string choir has violin, viola, cello and string bass. A good violinist can always play viola; so the cello and bass are the only two that need consideration. The knowledge necessary to carry pupils to a stage of proficiency on either of these instruments can be acquired by any violinist in a few months.

The reed or wood-wind section has clarinet, flute, oboe and bassoon and the "moaning saxophone." Of these the clarinet is the more complex, as the fingering of the others is quite similar and the single and double reeds are the only additional obstacles. So a knowledge of the clarinet is decidedly advantageous for the instructor, and the rest can be learned by application.

In the brass choir are cornets, horns, trombones and tuba; and the most formidable two are the horns and trombone. The technic of each is distinct; yet, with a playing knowledge and experience on the cornet, these two instruments are possible of attainment.

The remaining section is the drums; and because of their dominance, especially in the hands of a husky boy, one needs information concerning the execution of the instrument and not of the player.

As a summary, you naturally wonder if one man can do all of this and do it well, and the answer is yes. Most musicians play more than one instrument and some play many; while others know the fingering and general technic of the different instruments well enough to start a pupil and continue his instruction until his playing ability and interest in music urge him to seek a special teacher. Every community has musicians who are so equipped; those musicians not so versatile are willing to increase their professional efficiency by taking up the study of the instruments they do not play.

For the teacher, then, find the man who can play more than one instrument—violin, first; clarinet, second; cornet, third; or any substitutes for these except the ukulele.

Many persons will hold that a teacher so equipped is a "jack of all trades;" others will venture that he cannot teach all instruments with equal facility; but the prime factor yet to be considered is the orchestra itself. Each member in a professional or symphony orchestra is master of the instrument of his choice; but school children are not yet masters and they present an entirely different problem. For that reason a teacher who has a good working knowledge of many different instruments of the orchestra will weld and develop a better ensemble because of this ability. The composite effect of the orchestra as a whole is preëminently the main objective of instrumental music in the public schools.

Equipment

No other department in the schools dealing with vocational subjects such as manual training, cooking, sewing, millinery, or the trades, has as little of the equipment furnished by the Board of Education as the music department. A library of music, racks, and instruments are the only equipment needed; but the need of these is imperative. To any orchestra, anywhere, in any city, will be brought violins, cornets, clarinets, maybe a flute, cello or trombone; but what of those unusual instruments, the viola, string bass, oboe, French horn, drums and tympani, so necessary to complete the instrumentation? These must be supplied by the school department just as they supply typewriters, sewing machines, lathes and forges. And what of the cost? The money invested in one machine shop alone would furnish all the unusual instruments needed to complete the instrumentation of ten high school orchestras and bands, to buy a large library of good music, a grand piano, and still leave enough to start a substantial savings account.

Many are the Principals who will escort you through the educational plant and expatiate at great length and with much pride upon the new and modern equipment to be found in every branch of trades and arts, except the music department. This must be content with pianos of dance-hall type and tone; orchestras and bands perform with only half the complete instrumentation demanded; and the Principal is satisfied "because it is cheap" and the music instructor is dissatisfied "because it is incomplete."

And what of the pupils? Are there boys and girls in the schools who could learn to play these unusual instruments? How do pupils learn to manipulate a typewriter at one hundred words per minute? How do they learn to cook pies and cake that rival those that "mother used to make?" How do they learn to run a lathe, a planer, a

(*Continued on page 643*)

Quick Ways of Teaching Youngsters the Notes

By Mrs. R. J. Manning

As all teachers of experience know, the beginner needs more careful instruction than the advanced student. Good or bad habits in music are formed early as in everything else. How often we hear music teachers say, "If they knew their notes; I would not mind teaching beginners."

Now let us make this much dreaded task easy and pleasant for both teacher and pupil.

Jennie and Jessie come for their first lesson—bright and talented twin-sisters. We seat them side-by-side at the beautiful grand piano they are so eager to play on.

How simple it is for them to find groups of "three" black keys and "two" black keys alternately! Inside of a few minutes, both can delightedly point out these groups.

Then we locate A (in group three). They find it instantly, and play a game of "finding all the A's" and seeing which can get them first! Such a merry scramble! They "skip notes" all over the keyboard, until A, B, C, D, E, F and G are often learned in one half-hour lesson, which ends with the location of middle C. The little tots go away with "something to practice;" for they have had a game of "skipping notes in which each tries to catch the other." Often they are further equipped with a knowledge of "feeding the musical pigs" at this first lesson—going home with two music games. "Feeding the pigs" is a first lesson in technic.

This alluring game is played by placing "five fingers on five notes" (each hand separately) with fingers beautifully curved, each one resting lightly on the "ball of the finger." Now all of these tiny digits must be tilted prettily towards the thumb; when, behold, they turn into pigs!

The ball of each finger is a "little mouth" and the feeding is done by tapping a note three times with each finger successively, taking great care with the fourth and fifth fingers, which are the "youngest, weakest pigs and need help." This game is persisted in with many children until an amazing control of the fingers is acquired before learning to read sheet music. Then the next "bugaboo" is the staff. The pupils are anxious to find that something which the "beautiful golden notes *lean* upon to make music." Heigh ho! here it is:—

Find your middle C. Skip one note and then press down the second note above middle C (which is E); then the second above that, and so on; keep holding down every other note until you are holding down five. It takes both of Jennie's tiny hands to hold down E, G, B, D, and F on the staff. Presto! another game.

Now whilst Jennie is holding down the treble staff, Jessie is told to help her by "playing teacher." The five notes held down are the lines (E, G, B, D, and F). The four notes "sticking up" are the spaces (F, A, C and E). It takes both lines and spaces to make the staff (in its new dress). Then repeat the old formula—1st line E, 2nd line G, and so on. One child asks what note is on a certain line or a certain space in the staff; the other names the note and finds it. Then they exchange positions. Jessie holds while Jennie "teaches." Soon (often in a second lesson) they both know this staff perfectly.

Have blank staffs with clefs ready. When they know the keyboard notes perfectly have them write them on the staff (whole notes, because easier to make, are best for this), thus preparing a solid foundation for accurate reading. During the mastery of the staff in treble, if the least weariness is shown, divert their attention by playing a "staff tune." Take each pupil separately and regardless of time make her recognize the old tune "Days of Absence" by applying a knowledge of lines and spaces. As the real teacher calls them rapidly, have the child press down the correct note on the piano in staccato fashion, thus:

Teacher. Fourth space
Pupil. Touching E (at same time)
T. Fourth space
P. Touching E (at same time)
T. Fourth line
P. Touching D (at same time)
T. Third space
P. Touching C (at same time)
T. Third space
P. Touching C (at same time)
T. Fourth line
P. Touching D (at same time)
T. Fourth line
P. Touching D (at same time)
T. Fourth space
P. Touching E (at same time)
T. Fourth line
P. Touching D (at same time)
T. Third space
P. Touching C (at same time).

The staff in bass begins with the second G below middle C and is learned the same way as the treble staff was learned. The notes held down are: G, B, D, F, A; those sticking up are: A, C, E, G.

After both staffs are mastered it is interesting to see two tots; one holding the treble staff, the other holding the bass staff, in a cross-fire of "very hard skipping this time!" The real teacher tries to catch them, too, with rapid questions from one staff to the other.

Leger Lines, Note Values, Time, Intervals, Triads, Signatures, and Scales are made equally simple and valuable in succeeding lessons or articles.

"Music is one of the oldest modes by which man has expressed his emotions and aspirations. It brings pleasure to probably more people than any other one of the arts. Whatever contributes to a wider dissemination of interest in it is entitled to be regarded as a real public service."—President Coolidge

The "Game" in Study

By Lynne Roche

One day a young man, walking through a small wood, became so engrossed in the game of watching the furred and feathered folk who scurried over the moss-covered ground, flitted from tree to tree or intermittently darted among the foliage that he was drawn to repeat the pastime. Soon the habit had grown upon him until his visits became almost daily and he had learned to sit for hours as still as a stump, just that his woodland companions might lose their timidity in approaching him. Finally he built a cabin in the forest so that he might live much of the time among the lively, lovely little woods-folk who had become his friends. The stories he wrote of these associations made the name of Henry Thoreau one of the most familiar and most respected among naturalists.

The musician, young or old, may have many a game not so different, in the "study forest." So much depends upon the attitude in which the work is approached. There is not an "animal of the musical woods" that is not as interesting as could be if only one gets into the game of trying to find just how familiar he can become with it. The trill will serve, as one. Get into the sport of chasing its history back through the centuries to the days when Opera was young, and there will be an entirely new thrill in its execution.

And then, best of all, get into a game with yourself. "Beating the other fellow" has no sensation to be compared with that of a victory over one's own past work. The thrill of knowing that the thing just accomplished is an obvious advance on that ever done before is more soul-stirring than laurel on the victor's brow. And the best of it is that the game may be played every time one sits down to study or practice.

New and Practical Helps in Sight Reading

By the Eminent Pianist, Composer, Teacher

EUGENIO PIRANI

Why not learn to read difficult music as readily as you read your daily paper? Hundreds can do it. Why not you, also? Mr. Pirani's article will prove a real help if you will undertake to try his methods for a little while. Sight reading is becoming more and more important.

How often one meets pianists of merit, who find themselves at a loss if they are confronted with reading at sight, even if it may be an easy composition!

I have in mind a young pianist who is truly remarkable for her rendition of a quite exacting repertoire, including difficult works of Bach, Beethoven, Liszt, and others. She is possessed of a brilliant technic and also her interpretation is very artistic and poetic. But give her to read the easiest piece of music and she is like a fish out of water. Rhythm, notes, everything is bungled beyond recognition. She candidly confesses her inability to read at sight. (Confession is an extenuating circumstance, but not an excuse!)

There is here a regrettable deficiency in the musical training. A pianist cannot, often times, escape the necessity of playing for four hands, or in chamber music ensemble, or to accompany some singer or instrumentalist, without having the opportunity to study the music beforehand, even if he does not make a specialty of this branch of pianistic art. The consciousness of his inability to cope with this eventuality must be very humiliating indeed.

To all those who are eager to fill this gap in their musical education some suggestions are offered which may facilitate the task. Several things must be quickly perceived by the sight-reader, viz.: *rhythm, notes* and the *signs of expression.* In the case of complex music it is not easy to grasp at the same time these three important elements.

Faults of Time and Rhythm

If one plays with somebody else, like in four-hand compositions, the rhythm, the time have first place. It is of course bad enough if one strikes wrong notes; but this type of errors at least does not totally upset one's partner, The playing can go in spite of mistaken notes. Much worse are faults in time or rhythm, which compel the partner to stop and to seek a place where the two players can get a new start. Everybody who has had the misfortune to play with such an undependable partner knows how provoking, how exasperating these continuous interruptions are. Therefore the *rhythm* should be the first thing to be mastered by the sight-reader.

I have obtained the best results with my pupils by "isolating" the rhythm, that is beating the rhythm alone, independently from the notes, on a box or, still better, on a tambourine. One does not really need a tambourine to begin practicing in this manner. An ordinary wooden box and a lead pencil will complete the necessary equipment. I prefer however a tambourine as being more picturesque and because it appeals more to the phantasy of the pupil, being a regular "instrument."

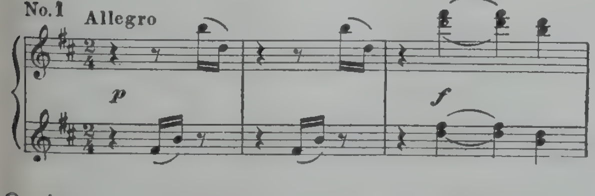
Use the Metronome

If another player for the *secondo* part is not at hand one could use also a metronome, set at a moderate rate. However the metronome makes matters much easier for the pupil, not offering the contrast of different rhythms contained in the *secondo* part.

If a simple box is used, place the music on a rack before the pupil seated at a table. Let him tap the rhythm through the entire piece with great accuracy making a distinction in the matter of weight of the taps for all accents, all fortes, all pianos, and other features.

Let us take for instance the N. 19 of the (excellent) Etudes for 4 hands, Op. 97, by Bertini. The beginning measures of the Primo are as follows:

No. 1

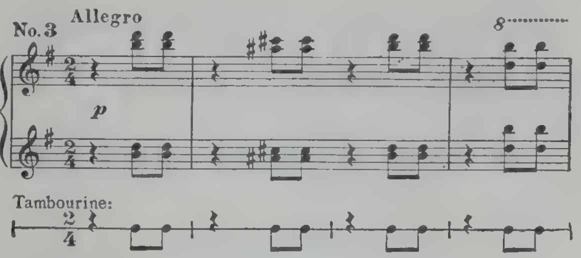


On the tambourine the rhythm would be beaten as follows:

No. 2

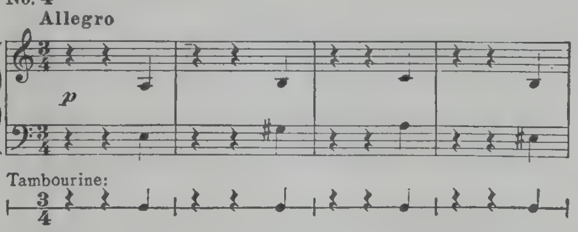
Thus isolated the rhythm will be easily mastered by the pupil. Or, in the Etude N. 12 of the same work:

No. 3



Or in the Etude No. 25, *Primo:*

No. 4



The whole "primo" part ought to be "drummed" in similar manner from beginning to end, while the teacher (or the better musician) plays the "secondo" at the piano, as it is written. This training ought to be continued until the student feels himself able to grasp the rhythm at one glance, even if retiring at some distance from the music, so as to perceive *only the rhythm without the notes.*

The development of the time sense itself is most important. One does not count when one plays in public. Time must be felt. The trouble is that many piano teachers expect the pupil to come by this time feeling naturally, like breathing or seeing. It may come in that way to some very gifted persons; but in most instances it is a matter of careful, attentive building upon the part of the teacher with close coöperation of the pupil. It certainly deserves specialized attention. Therefore, after the pupil has developed the rhythm, in a piece with the metronome, as we have indicated, the teacher should hear the pupil tap the rhythm without the use of the metronome and without counting. This will call for the strictest aural attention upon the part of the pupil.

After that a similar procedure ought to be employed, *isolating the notes from the rhythm,* in other words, considering only height or depth of the notes, independently from their rhythmical value. Also here a thorough training will be necessary, especially in deciphering the notes with many lines above or under the staff.

In fact, how many times one hears the inexperienced sight-reader ask: "What note is that?" He often is bewildered by the great number of lines and perplexed to find out what note is represented. Instead of counting the lines and the spaces, he tries to guess, mostly wrongly!

A great help in reading at sight will be the ability to identify groups of chords. This is one of the reasons why a thorough study of scales and arpeggios (see "Mastering the Scales and Arpeggios" by Cooke) as well as an understanding of harmony are so advantageous to the study of sight reading.

Quick Eye Work

After the pupil has come to identify the ordinary triads easily, his next step is to the seventh chords. It is not easy for the eye to grasp note groups with four notes quickly and accurately. Good sight reading depends very largely upon a quick eye; and a quick eye means eye training and eye development.

Contrapuntal exercises are also good for reading, because they take the eyes as well as the fingers into different paths. For such a purpose Bach is invaluable; "Album of Favorite Pieces," the "Two part Inventions" and similar books. (Polyphonic Studies compiled by Theodore Presser were published largely because of their value for sight reading purposes at a certain stage of development.)

How, for goodness sake, can a pianist read at sight, if he is not thoroughly acquainted with rhythm and with the notes? I, therefore, insist on mastering apart these two integral components of notation. It reminds me of a significant anecdote which will illustrate my method: A famous general, I believe it was Frederick the Great, asked his soldiers, on the battlefield where a carcass of a dead horse was lying, if any one could tear off its tail. Several tried hard to do so, but none succeeded. Frederick showed how easily it could be done. He tore the hairs one by one and in no time the tail was completely torn off. MORAL: What we are not able to master collectively, we can easily overcome separately.

Look Ahead!

After a sufficient skill in these single operations has been acquired, another matter should be considered. To acquire a certain amount of speed in sight reading, it will be necessary to look a measure or two in advance of the place one actually plays. In other words, the player ought to have always something in reserve for the next moment. "Looking ahead" means to figure in advance what comes after, to feel in advance the notes, the passages, with the right fingering, under your fingers. The quicker and surer you can perform this *mental* operation, the more fluent will become your sight reading. The moment you lack this reserve your machine comes to a sudden stop and consequently your partner also is again put out of commission. Like the singer, who must always have a reserve of air lest otherwise the phrase will be suddenly chopped off, so the player must be prepared two or more bars in advance. You must have in your bank some funds in reserve for future expenses, or you will find yourself soon in a sorry plight.

Do not believe, however, that this advice is meant only for beginners. Also advanced players will benefit from this procedure, namely, giving the first glance to the rhythm and the successive ones to the notes. Of course the two operations must follow one another with the utmost rapidity, but still be distinctly separated from each other. And, furthermore, this method of sight reading will prove beneficial not only to pianists, but as well to other instrumentalists and singers.

Resuming: Study first the rhythm alone, perhaps with the help of a tambourine.

Try to decipher at a glance the notes, especially those above and below the staff, independently from the rhythm.

Continue training, uniting the two elements.

Look one or more bars ahead of what you are actually playing.

Self-Test Questions on Mr. Pirani's Article

1. *What should be the first thing mastered by the sight reader?*
2. *Name two good ways in which to learn rhythm?*
3. *How should notes be isolated from rhythm?*
4. *State what kind of exercises are valuable in sight reading?*
5. *How does one acquire speed in sight reading?*

Don'ts for Sight Readers

Don't Hurry! Take your time. Much bad sight reading is due to the fact that the student has been impatient, that is, has tried to read too difficult music too soon.

Don't read single notes! Form the habit of viewing your work in chord groups. You don't read single letters when you read a printed word.

Don't despair! Many people who might be good sight readers give up too quickly and say, "Sight reading is a gift. can never do it." The real gift is that of "work" and "sticktoitiveness."

Don't be easy! Sloppiness is unforgivable. Concentrate. Form the habit of playing right. Play the right notes, the right time, the right rhythm, the right accents, the right phrases, the right expression, the right pedaling. It is marvelous what the human eye can grasp and what the human mind can digest in a flash if one will only persist and "concentrate" and not be easy with oneself.

Targets in Music

By Jessie E. Britt

One of the greatest things in life is a target, a definite aim. In the study of music there is too often a tendency to drift with no definite goal in view and with but little to show for time and effort expended. This is especially discouraging to young pupils who are at an age when immediate rewards are more alluring than future fame or glory.

If some means, however simple, can be used to denote definite stages of progress, then the interest and enthusiasm are quickened, and a friendly spirit of competition may be stimulated among the pupils. It also pleases the parents by enabling them to judge the musical progress of the child and to co-operate in a helpful way with the teacher.

With young pupils, gilt stars, which may be purchased at a trifling expense at any stationery store, can be used very effectively. When a piece of music is perfectly learned or approximately so, and can be played in a musical manner, with correct fingering time, and notes; then the teacher sticks the gummed star upon it, and thereafter it is proudly alluded to as a star piece. For a memorized piece the larger sized star may be used. It is surprising how eager and delighted the little pupils are to get a "gold star" and how they hurry home to show "the folks."

As the pupil advances in age and proficiency, other ways may be used for making the study definite and worth-while. As soon as the second grade is reached, each pupil should have an assignment book which need be only an inexpensive note book with durable binding. In this the teacher can write down exactly what is assigned, with practice time for each. The pupil should also be required, or at least encouraged to keep a practice record for each day. To further encourage the student and indicate his progress it is well to employ a system of marking in red pencil on the assignment book. E may stand for excellent, G for good, F for fair, and U unsatisfactory. One splendid result of this system is the careful supervision which the parents are able to give the pupils in the home practice.

The graded courses of study, of which several good ones are to be found among musical publications, furnish a standard of advancement and tend to promote systematic work, when judiciously adapted to the needs of the student and supplemented by other material. Before promotion into another grade a simple test may be given on such elements as musical terms, time values and key signatures. Of course the tests should not be so rigid as to be dreaded by the pupil. He should feel, rather, that they are simply a means of fixing important points in his mind, so that he may proceed more rapidly and pleasantly in his musical studies. If he has a real musical target he stands a far better chance of making progress.

The Use of Improvisation

By Grace Mays

Piano lessons may be made much more interesting by a teacher who has the talent for improvising. Something of this kind is needed as a stimulus for pupils who are not especially interested in taking piano lessons.

Four drills are suggested here for use by a teacher who can improvise.

First—The teacher allows the pupil to name a key, the kind of rhythm, and a title for a composition to be improvised by the teacher. Of course the mood of the composition should be consistent with the title. The teacher carries out the idea which the pupil has suggested.

Second—The pupil suggests a key and the kind of rhythm, then gives a title to the composition after it has been played. Since it appeals to the imagination, this is more interesting to some pupils than naming the title before the piece has been played.

Third—To help develop the child's sense of rhythm, the teacher improvises, and then allows the child to name the kind of rhythm after the composition has been played. This causes the pupil to listen closely for the accented beat of each measure.

Fourth—To familiarize a pupil with the different keys, have him to watch the keyboard while a selection is being played. The child can easily distinguish whether it is in a major or minor key, if the teacher has explained that minor keys are suggestive of something weird, gruesome, or melancholy; and that major keys express bright, happy or exciting ideas.

These drills appeal to pupils and are a real pleasure for them. They are also enjoyable work for the teacher and are means by which one who hasn't time for more extended composition can use his talent for improvising, in a beneficial way.

Training That Awkward Thumb

By Wendal C. Wood

The thumb is the awkward member of our family of digits; on its action more than on anything else depends the speed and evenness of our scales and other passage work. All too often it fails us, preventing the acquirement of the desired qualities; so special training becomes necessary.

Technic specialists insist on *preparation* of the thumb's note; that is, that the thumb must always be in readiness above its next key before the time to play the latter. The following little exercise was designed to make the thumb form this habit of finding its next key at once after being used, and serves to facilitate greatly the thumb-under movement in scale and arpeggio playing. It also enables us to concentrate our attention on the thumb movement itself.

A Simple Exercise

Play any scale in a skeleton form, using only the thumb and forefinger, leaving out the 3rd and 4th fingers and their keys, thus:

C D (E) F G (A B) C
Ex. 1. C major r. h. 1 2 1 2 1 etc.

The notes in parentheses are to be omitted. Use the same fingering in descending the scales.

Ex. 2. B♭ minor
C B♭ (A G♭) F E♭ (D♭) C B♭
1 2 1 2 1 2 etc.

Use the same fingering in ascending.

As soon as the 2nd finger touches its key, D, (Ex. 1) slip the thumb under it by an quick easy motion and let the latter drop *lightly* on F, and so on up the scale. Play in even rhythm, very slowly at first and *always* with but one hand at a time. (Notice that "slowly" refers to the length of time the key is held down—the thumb movement itself must be quick.) This skeleton scale may be played up and down the keyboard through as many octaves as desired, like the ordinary scale; but it is better to practice it a number of times successively in the same direction. Most of the scales in the piano literature are "one way" scales. The "thumb-under" should be practiced more than the "hand-over" movement; and the left hand more than the right. The following schedule of repetitions should suit most pupils:

L. H., descending, 10 times
R. H., ascending, 8 times
L. H., ascending, 5 times
R. H., descending 4 times.

Play thus in all keys; the thumb's first note will not be the keynote in those scales which begin on a black key (see Ex. 2). Since the scale fingering is determined by the thumb's notes this exercise furnishes an excellent means of learning the various scale fingerings.

Keep the arm lightly poised; it should neither be stiffly held up nor should its weight be allowed to drag on the hand. If the arm is well balanced it will be easy to keep the wrist free. In playing a scale the hand should be slightly turned in at the wrist and the fingers well rounded, in order to allow the thumb to swing under easily.

The exercise should be played very slowly, until attention to the above details has become a habit. Then the speed may be gradually increased. Rhythmical variations such as  are valuable. If this rhythm is reversed the thumb taking the sixteenth note and the exercise is played very fast with the thumb note always pianissimo, we have the most difficult form possible; and the one who has mastered it has mastered scale technic.

Three- and four-note arpeggios may be studied in the same way as outlined for the scales.

Try this method of practice for a month or two; the regular scales may be dropped for the time being since the third and fourth get plenty of other exercise. When returning to the normal scale form, great gain in ease and velocity will be noticed.

The Necessity of Ear Training

By Arthur Olaf Andersen

Lack of proper ear training is one of the greatest drawbacks in the progress of the average American music student. This deficiency is especially noticeable in the pupils of the private teacher who rarely, if ever, takes the trouble to determine just how much or how little each individual knows regarding this most important branch of an all-round, general musical education.

Ear training, to the music student, is what rudimentary knowledge of English is to the literary scholar. It must be acquired in some way before one is capable of any degree of mastery in either subject. In studying English, the necessary elements of grammar, phrasing by punctuation as well as rhetorical construction, must first be acquired. In ear training, an equally careful mastery of all the primary factors pertaining to the language of sounds must be attained.

The first thing the teacher should do is to ascertain whether or not the student has perfect or relative pitch. The necessity of perfect pitch in the student has been a matter of much controversy among teachers of theory. The majority insist that it is an indispensable requisition in the success of a composer, singer or performer of a string instrument, but not so important in the case of the pianist or of the performer of an instrument where predetermined pitch exists. This may or may not be true in some instances, but we argue that perfect pitch is not necessary in any case! The delicately sensitive ear of the musician might save him a great deal of hard work, but what has perfect pitch to do with the inspiration that gives us an exquisite melody, a ravishing sequence of harmonies, a well balanced, symmetrically designed composition? True, perfect pitch will be of great assistance in the setting down of the musical expression; but perfect pitch never was and never will be the inspiration of composition.

In the matter of the instrumentalist or vocalist, the perfect ear is undoubtedly an asset of extreme importance; but the fact that one does not possess this gift of nature need not discourage or disconcert the young musician, for he has it in his power to develop his auditory faculties to the point where they will serve him in every emergency.

Ear training should be seriously considered by every student, no matter whether he has perfect pitch or not Ear training does not alone mean the ability to hear tones in their exact pitch. That is but a small factor in the study of ear cultivation. It further implies the three "R's" of music: the "Readin'," "'Ritin'" and "'Rithmetic." These may be interpreted as constituting the ability to read music audibly or inaudibly, to have mastered the fundamental principles of notation chord spelling and chord progression, tranposition, modulation and ornamentation. It also includes the ability to perform with distinct clarity and ease all the various simple, compound and complex rhythms.

The most coveted prize at the Paris Conservatoire de Musique is the *medaille de solfege*. The winner of this distinguished honor is considered the greatest all round musician in his class for that year. The final contest, at which the winner is to be decided upon, results in an excitingly thrilling ceremony. For this event the judges, chosen from among the musical elite of the French Republic, consider the invitation to serve as a mark of special distinction and recognition. The entire faculty arrives early at the large Conservatoire Hall, in order to procure advantageous places; next, the student body, which has been clamoring for admittance at the portals, rushes in; and, finally, the specially invited guests are allowed to enter upon presentation of invitation cards, being therewith escorted to their appointed seats. An unbroken and tense silence reigns from the moment the first contestant is put through the paces, until the final recitation has taken place. Upon the announcement of the winner, from the judge's box, pandemonium breaks loose, the successful candidate is lifted upon the shoulders of his confreres and borne from the Hall amid vigorous applause and shouts of *Bravo! Bravo!*

Thus it will be seen how enormously important the French musicians consider the study of solfege, which after all, is ear training in its practical demonstration.

The ultimate benefits derived from a comprehensive course in ear training are of inestimable value to the music student, be he instrumentalist, vocalist or composer. This training may not disclose the fact that he is the proud possessor of perfect pitch, but, in any event, he can so train his ear as to make it serve him in all his work Relative pitch may be acquired through proper study, thought and practice; and relative pitch will bring to him all the practical advantages of perfect pitch.

How To Organize A Boys' High School Band

By J. W. WAINWRIGHT

Music Supervisor of Fostoria, Ohio, and Director of the Fostoria High School Band, Which Won the Championship of the United States

"Always Begin Music Study With the Piano"—Read Director Wainwright's important words on this subject on the next page

It was evening of the memorable day when the happy news came over the wires to the Fostoria home folks that their band had won first honors at the National Contest, the occasion a social gathering of Fostorians where naturally the favorite topic of comment was the band and its victory, that the following conversation took place:

"Well, I suppose this will make your boy anxious to join the band—or isn't he musically inclined?"

"Not particularly so. But, of course, you don't have to be musical to belong to the band."

The first speaker, a trifle taken aback, adroitly avoided an argument by observing that it "helped some" to be musical.

My informant was boiling over with indignation when he sought me out upon my return home to tell me of the insult, as he chose to term it, which had been hurled at the personnel of his idolized company of musicians. But I told him we had been paid a rare compliment.

For what seemed to my friend an unjust statement contained more than a grain of truth. My commentator might have gone a step farther and said, "Of course, one doesn't have to be musical to direct a band," without deviating very far from the truth.

And there you have in a nutshell the reason for the unmitigated, unprecedented, unquestioned success of the boy band movement.

The from-pioneer-home-to-White-House story of the organization and advancement of the Fostoria High School Band is doubtless already familiar to many readers of the Etude, so I need not review it here. Musical or unmusical, I doubt if my fortitude would permit me to endure those first rehearsals and programs again. The terrible tension of the first five beats of the "Day in Venice Suite," when I trusted madly that my young amateurs could and would "hit" the sixth; the sour soarings of the clarinets a little farther down the score; the uninvited augumented chords (my apologies to the horns); the basses *ploob-ploob*-ing along, perhaps a measure ahead or behind; the drummers sullenly slinking behind their cymbals if they were caught off guard and received their inevitable reckoning for such an offense—it was not musicianship that counted then. Oh, no; it was pure, unadulterated grit.

Thanks to many fortunate circumstances, the percentage of the unmusical now in our band is exceedingly low, while the number of those who are naturally endowed with musical talent, who undoubtedly will reap a rich harvest from their training in the band whether or not they choose to make music a profession, I could place at twenty-five, or about fifty per cent. of the membership.

But I am serious when I say that, at least at the outset, not so much depends upon a boy's accurate sense of pitch as upon his enthusiasm, and not so much upon a director's knowledge of phrasing as upon his understanding and love of boy nature. Earl May, in his treatise on "The Silver Cornet Band," drives straight at the heart of the situation when he tells in his humorous way how even the most uninspired, unwilling student of the piano or violin, when fired by the prospect of a parade or a concert in uniform, will seize a horn and blow himself into a frenzy of enthusiasm.

First and foremost, let there be a band! Then let time and tide cut down the hills of cornets, fill up the valleys of clarinets, weed out the saxophones, set up drummers and basses as invincible as the forest pines and throw over the whole a shimmering veil of color, delectable and undying.

Time and tide are personified in the director whose baton is the magic wand which may make or break the destinies of his organization. It is sad to say that there are in the public schools many teachers who are trying to teach instrumental music to school children who know not what they are doing. In most cases it falls to the lot of the already overworked supervisor of vocal music to try to build up the band and orchestra; but, most emphatically, teaching instrumental music is a job all by itself and should not be attempted by anyone who has not been especially trained for it, who does not know every instrument, including its different combinations of fingering, who cannot unearth technical mistakes in the playing of his pupils and then correct them. The lack of well-trained supervisors, or, to place the blame where it actually lies, the lack of funds to secure well-trained supervisors, is the greatest drawback to the progress of instrumental music in our schools to-day.

A Leader of Boys

But paramount in importance to his knowledge of instruments is the director's faculty for becoming a leader of boys. This implies that he must understand boy nature, must be able to mingle with them and cultivate their confidence and yet retain poise to stand before them and issue instructions with no thought but that they will be carried out. He must be able to break through the barrage of excuses which they sometimes build up to keep from shouldering their duties. There is the boy who cuts and pastes music in order to pay for his lessons, whose grandmother dies every time a new piece arrives to be pasted; the boy who is invariably "ill" on ideal days for fishing; the boy who in all seriousness walks up at the beginning of a rehearsal and says, "I just came to tell you that I can't come to-day." A director who could not disclose such camouflaging would soon become the laughing stock of any group of wideawake high school boys.

What has helped me to know and understand my boys better than I could have otherwise, is the opportunity of being with them when our engagements took us on trips out of town. I once knew a band that went on the rocks because the director was too disinterested or too unaggressive to accept any out of town engagements; so I determined that whatever faults I might have as a band leader, I would make it a point never to cheat my boys out of the joys of a trip away from home. As a result, we have travelled and tramped ourselves haggard many a time; but the opportunity of really getting acquainted with them and the spirit of good fellowship which arose have more than repaid me for any personal sacrifice. It is amusing to observe how their natural characteristics sprout out as rapidly as mushrooms after a warm spring shower, when they are thrown upon their own resources. Some of them are like the proverbial sailor with a sweetheart in every port; some consume enough food at meal time to supply a small-sized army; a certain few can be depended upon to keep us in a hilarious state of merriment with their jokes and antics; but the boy I shall never forget is the one who stocks up with five-cent Hershey bars and then, when the car is safely out of the city limits, sells them two for fifteen cents and earns spending money for the coming day. Some time he can truthfully say that he "got his start" in the High School Band.

The trip home usually witnesses the new band members as victims of a certain ceremony of initiation (four degrees) which only fun-loving high school boys could invent. The boys who have graduated and have been away for a year or more never come back for a visit but they saunter into my studio, ostensibly to pay their respects, but in reality to spend a little time recalling the incidents that occurred when *they* belonged to the F. H. S. band. These pleasures of reminiscing will probably mean more to them as the years go by than the technical training which they received.

In many respects the director's knowledge of boys may have a very direct effect upon his work How many precious hours are wasted every year—every week—at rehearsals, not alone on account of tardiness and absences, those two bugbears of music teachers which, like the poor, are always with us, but because the leader does not know how to get the most out of his boys. Our band might still be working on "Our Director March" and "Iron Count Overture" if I had chosen to accept what my boys chose to give as their best effort; but I knew what I wanted them to do, guessed at what they were able to do, and tried to awaken them to the fact that they could do more than they were doing. Someone very truthfully has said that we are all as lazy as we dare to be; and high school boys are no exception. They have to be startled out of their state of dormancy once in a while—sometimes twice in a while. They have to catch the vision. (My own individual means of "waking them up" may not always coincide with the best recognized pedagogical principles; but it gets results.)

Then again, why do so many directors content themselves with the A, B, C's of band literature? What would happen to a violinist if he never attempted Kreutzer because he knew he could never master it? We were playing at the aforementioned "Day in Venice Suite," "Peer Gynt," "Dwellers of the Western World," and "William Tell," when we probably should have been playing things much less pretentious. But we did not give them just the once over and then lay them up on a shelf—WE WORKED. The boys knew when they came that they might not work on more than one number during the whole rehearsal; but I have heard many of them declare that they would rather practice two hours on something very difficult than one hour on something easily within their comprehension. Our orchestra worked for twelve consecutive rehearsals on one big overture without having anything light on the bill of fare. I admit that is going to extremes; but at the end of that time we could do it creditably and had gained enough technic that the lighter numbers came just as easily as though we had been spending most of our time on them.

Some time ago a well-known band director, after hearing our boys play a concert, said, "A band like that may *happen* once in a generation," but I say it can "happen" any time, anywhere, when a director and his boys hitch their wagon to a star and then get behind it and *push*.

THE CHAMPION BOYS' HIGH SCHOOL BAND OF THE UNITED STATES
The Band of the Fostoria, Ohio, High School, Which, Under the Direction of Mr. J. W. Wainwright, Won the Highest Honors at the Last National Contest

I believe the same principle holds good in private teaching. When a boy comes to me with a cornet, after a few initial lessons (to be explained later) we begin with Arban and we live with Arban until he has reached the place where he is ready for something big. Then we take that something big and wrestle with it, a limb at a time, if necessary; and before we know it he is playing "Carnival of Venice" and other time-worn old standbys which seem to be necessary evils of a cornetist's career. Then we have the satisfaction of knowing that, even if he hasn't masticated every morsel of technical food with which they abound, at least he has plenty of time to digest it later.

If violin and piano teachers would aim a little more directly at their final goal they would see faster progress in their pupils. They are many times so engrossed in making out a well-balanced course of study—left-hand studies, bowing studies, double stops; or for piano, pedal studies, independent exercises for staccato, legato, drop arm, and so on—that they defeat their own ends, technically speaking. I think Musin came very near to fulfilling a long-felt need in the violin teachers' sphere when he invented and compiled a set of instruction books consisting of series of daily exercises designed to put the pupil in shape for his real day's work—his etude or concerto as the case might be. Usually it is left to the teacher to map out daily dozens for his young aspirants, but how many are too indolent or too unforeseeing to do it.

And this reminds me of the preacher who told the farmer how to plant his corn and the farmer who told the preacher what to preach about. So if some violin or piano teacher will give me a few pointers on how to develop my band I have no doubt the benefit will be mutual.

And now, in the belief that many readers of the ETUDE are men and women with the ability and the personality to develop successful bands and orchestras, if they knew where and how to begin; and in the hope that, by relating some of the facts which it has taken me some years of experience to learn; I may map out a shorter cut for some who are just about to undertake this fascinating work; I am going to set down on paper a few of the most important steps which I would follow if I were to begin again with new material to try to organize a group of boys into an efficient high school band. Bear in mind that this is not intended for those who are already well advanced in the art of band making. Far be it from me to inflict my ideas and opinions upon anyone whom experience has given well-seasoned methods of his own. But in the spirit of sympathetic co-operation with the novice who is about to do his bit toward making America musical, I am contributing the following suggestions:

Physical Qualifications

First, examine the applicant for his physical adaptation to the instrument. If he has good teeth, lips not too thick, he may play a cornet or flute. If his lips are rather thick give him a larger mouthpiece, such as baritone or tuba, or better still, one of the reeds. A reed player must be unhampered by any defective fingers; but sometimes a boy with a disfigured hand may be taught one of the brass instruments. Our solo cornetist, who won the Grand Prize for soloists at the Ohio State Band Contest, is a left-handed player because of an injury sustained to his right hand when a very small boy.

Have regard for the balance of the band. Be sure there will be as many reeds as all the rest of the instruments combined. It is best to have all the reed players to begin with the B-flat clarinet because it is easiest, and then pick the E-flat, alto and bass clarinets, oboe and bassoon players from them.

Do not put in a C-melody saxophone to play the oboe part. It is not a band instrument. As soon as possible get an oboe and teach some boy to play it.

A quartet of saxophones is sufficient. A leader who allows more is doing an injustice to his band.

Insure a strong bass section: For a fifty piece band there must be not less than three basses, two E-flats and one BB.

When the instrumentation has been decided upon, the boys should have about three or four weeks of individual work, after which the regular band meetings may begin. The psychological value of this can easily be understood, and any director, by spending a few hours with pen and music paper, should be able to supply his boys with simple material to hold their interest until they are able to play some of the easy marches already in print.

Perhaps a few words here regarding the individual training of the different pupils would not be amiss—the very first steps to take and the instruction books which have proven most satisfactory in working with pupils of school age.

Cornets, French Horns and Baritones

For cornets, French horns and baritones, let the first tone which is to be produced be G, second line treble staff, not C, as many instructors give it. At the first lesson the pupil will learn merely how to hold the instrument and to blow correctly this one tone. The second lesson it is sufficient to teach him F, one whole step below, and A, one whole step above the starting point, giving him a vocabulary of three tones. The third lesson he will learn E below and B above, and so on until he has encompassed the tones of the C scale. Now he begins with a most valuable exercise, that of playing the scale up and down with *a long sustained tone* on each degree, the teacher harmonizing at the piano. This should be continued as a preliminary drill for six months or a year, increasing the range and changing key as the pupil is able. In answer to the oft-made query, "What shall I do to improve my tone?", assuming that the pupil already knows how to blow correctly, the above exercise is the best possible expedient toward developing a clear, round tone, no matter what the instrument in question. Any teacher who does not insist upon such an exercise is not giving his pupils value received.

Meantime introduce Herbert Clarke's "Elementary Studies for the Cornet," and after he has played the first twenty pages and is able to finger and blow correctly, let him take up Arban.

Do not give pieces too soon; for often it gives boys the impression that they already know all there is to learn about playing and simply places a stumbling block in their path. One reason why we have so few artists is because young players get an inflated idea of their ability and stop working too soon. Their ensemble work in the band should be enough of an incentive to hold their interest during the first months of their study.

For trombones, the first tone to be produced is F, fourth line of bass staff. Never teach a trombone player to read in the treble staff. He may be asked some day whether he plays in the "town or city clef," a favorite joke among bandsmen. Spare him the embarrassment of discovering that he is out of date.

The plan of procedure is the same as for the cornets. The second lesson he learns E-flat and G, the adjacent tones to the given one, and increases the range in the same manner following the B-flat scale line instead of the C.

Pure Tones Always

By all means teach him to put the slide in the right place; and never allow a tone to escape that is not absolutely in tune. The practice of finding fourth position by extending the fingers and touching the bell of the horn is in very bad taste and should not be tolerated. Do not use the supplementary positions too soon.

Blodgett's "Foundation on Trombone Playing," with the exception of the last few pages, is very practical; and Arban's method, which is now written in the bass staff especially for the trombone, is, of course, excellent.

The trombone is a greater test of a boy's musicianship than almost any other band instrument and is certain to give pleasure to the serious student because of its inexhaustible possibilities. One of my boys, a fine fellow who has been a conscientious student for five years, said to me the other day, "I am just beginning to realize what a wonderful instrument the trombone is." It is well in choosing a trombone player to select a boy who shows very marked musical ability, preferably one who has had a year or two of piano lessons.

Always Begin Music Study at the Piano

And here I am tempted to deliver a lecture for the benefit of parents on the value of launching children into their musical meanderings with an hour a day on the piano bench. It is better to have a seven-year-old begin on the piano, and then to give him a band or orchestral instrument at nine or ten than to let him begin at once with his horn or violin; for he can cover the ground three times as rapidly after having this introductory work at the piano. The practice in reading notes, in learning to decipher rhythmical values, in accustoming the ear to correct melodic and harmonic progressions, is gained much more readily and in most cases more cheaply in the study of the piano than in the study of any other instrument. If possible, induce the child to continue his piano work indefinitely, even after he takes up his chosen instrument; for his progress in the one branch will go hand in hand with his progress in the other. Study the lives of our successful artists of today and how many do you find who have not been thoroughly grounded in piano before they found it possible to scale the heights that overlook the promised land of fame and fortune? For, with an adequate knowledge of piano, one has the magic key whereby he may gain access to all other kinds of musical literature; and nowhere more than in the field of music does one's success depend upon a liberal acquaintance with the products of the master minds of every century.

The clarinets, the most useful of the reed instruments, will begin on C, first added line below the treble staff—not the open tone G, because it is thin and hard to play in tune. The instruction book best suited is the "Lazarus Clarinet Method," by Paul DeVille.

A great many of the difficulties of the clarinetist would be minimized if composers and those who arrange for bands and orchestras would not write anything above high D, or better, high C; because those tones are very hard to produce and when played by any but the most professional of professionals, are shrill and disagreeable. They should be used only to obtain special effects.

Wagner's "Foundation to Flute Playing" is exceptionally well adapted to the needs of the young flute player. If we had for every instrument a text-book as complete as this, the task of preparing beginners for active band work would be much more simple. When something more advanced is required, "The Indispensable" is all that its name implies and is an easy step forward.

The Complex Saxophone

Of the thousands who try to learn to play the saxophone, the number of those who attain any degree of artistic excellence is smaller than that of students of all other instruments combined. Many young people, when they discover that playing the C scale and reading the melodies of popular songs is a comparatively simple matter, reach the conclusion that a possible six weeks of lessons will teach them all there is to know about a saxophone. But this strange cross between the brass and reed instruments is more complex than one would at first imagine. I dare say that ninety per cent. of our twentieth century army of saxophonists do not know how to finger it correctly. Take, for example, the progression B to C, or C to B—C should *not* be played with the second finger of the left hand but with the first finger of the left hand and the middle side key of the right. No matter how clever a performer, this mistake may easily be detected in most players. Then again, about ninety-nine per cent. do not know how or do not care to know how to produce a bearable tone. A mistake of fingering is easily forgiven, but the barbaric tone which comes swaggering out of the horns of most saxophone players strikes murder or suicide into the heart of any real musician. The saxophone family, especially the E-flat alto, when properly handled is a very useful instrument; but few ever learn the first principles of playing it correctly. If studied intelligently, with a conscientious teacher who insists upon correct combinations of fingering and good tone quality, it may be fairly well mastered in three or four years. "The Universal Method for the Saxophone," by Paul DeVille, has proven to be very satisfactory.

I wish I might take time to describe to my readers, as a certain prominent band director described to us at the M. T. N. A. meeting this year, how he trained the drummers for his "kid band," as he called it, out in Denver, Colorado. Suffice it to say that here, as in many other phases of a band leader's work, originality and tact on the part of the leader counts for more than assimilation of facts. We use the "Gardner Modern Method for Drum, Cymbals and Accessories" with very satisfactory results.

Oh, yes, the tuba! Well, in my opinion tuba players are born, not made. Anyone can learn to finger and blow this giant king of the brass; but when it comes to building the foundation for a big overture, expressing those subtle niceties of phrasing and shading which mean life or death to any masterpiece, our basses must be gifted with "the divine spark" if they succeed in satisfying the expectant mood of the critical listener.

As soon as possible after the first meeting it is well to organize the different sections of the band into groups for sectional rehearsals. This has proven a most effective device for bringing about a good ensemble and a finished production of any number which might otherwise have been too advanced for our boys, and has saved many a stormy hour at the regular rehearsal. Divide the band in the following manner:

B-flat, E-flat, bass and alto clarinets
Cornets
Baritones and trombones
Tubas and French horns
Saxophones

And don't forget the drums. Insist that the snares play the parts as written instead of trying to put in a lot of "fancy work," the product of their own imagination.

General Hints

From the beginning guard against allowing any, especially the cornets, to overblow. This is a very common fault and detracts greatly from the tone quality of the whole band.

Be particular about the appearance of the boys at rehearsal and in concert. It is surprising what slovenly habits directors allow. It is very little effort to insist that boys sit straight in their chairs, feet flat on the floor, clarinets held at a comfortable angle, fingers slightly arched, cornets and trombones held straight out almost parallel to the floor, and so on around the semi-circular tiers of players—yet it adds one hundred per cent. to the effect.

On the march, even in professional bands, one rarely sees two trombones held at the same angle. This is very bad taste on the part of both director and drum-major. From the beginning train the boys to hold their trombones at the correct angle when on the march, and they will take pride in a fine appearance.

Do not allow the drum-major to overdo his part—he must be snappy, but not grotesque.

Last, but not least, prove to your boys, by filling their minds full of what is noble and lasting in music, that punishing their instruments with the ludicrous and inane noises characteristic of "jazz" music is evidence of a missing link somewhere in their musical, mental or moral training.

Different kinds of music arouse different kinds of emotions. A military march played by a band on parade stimulates the feeling of patriotism; sacred music, stealing softly from the organ within the sanctity of church walls, awakens the desire for meditation and prayer; but *jazz*, such as is written by our modern composers of popular music and played by our present-day dance orchestras and traveling entertainers, cannot hope to call forth any but the lower passions and impulses, cannot help bringing to the surface those very emotions which, since the days when our primeval forefathers, attracted by the lurid fires of their chieftains, goaded by the shrieking of their fellows, spurred to action by the rhythmical beat of the tom-toms, stirred up their lust for blood and excited all that was animal in their natures, civilization has been trying all through the ages to stifle.

The Teachers' Round Table

Conducted by PROF. CLARENCE G. HAMILTON, M.A.

This department is designed to help the teacher upon questions pertaining to "How to Teach," "What to Teach," etc., and not technical problems pertaining to Musical Theory, History, etc., all of which properly belong to the Musical Questions Answered department. Full name and address must accompany all inquiries

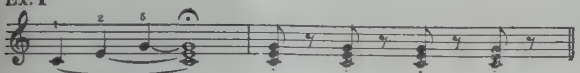
Infantile Paralysis

> A little fellow of nine, whose right arm has been affected by infantile paralysis, is having trouble in striking chords with that hand. For instance, if he attempts to strike *c-g-c*, his fourth and fifth fingers cramp and stiffen so that he is able to strike only c and *c* clearly. He says the only way he can play the chord is after his hand has been put into hot water for a few minutes. Is there a remedy for him? His playing is good otherwise, and he has no trouble with his left hand.—A. E. M.

It is difficult to prescribe for such an abnormal condition as you describe, without seeing the patient and finding out by experiment what he can do. The trouble may be partly traceable to that bane of pianists, a stiff wrist.

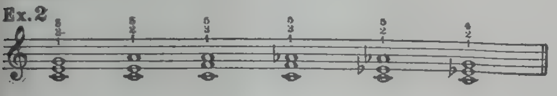
A useful means for learning to play a chord evenly and clearly is to sound each of its notes in succession, from lowest to highest, holding them down until the entire chord is within one's grasp. Then play the chord several times staccato, keeping the elbow low, and allowing the wrist to rise suddenly an inch or so at each stroke. This upward jump of the wrist will prove that it has not stiffened in the process and will also result in a clear, bright tone, caused by throwing the hand *into* the keys. For instance, taking the chord which you suggest, the pupil plays as follows:

Ex. 1



Continue this treatment with each of the following chords:

Ex. 2



These chords may then be transposed into other keys, and may be similarly studied with the left hand.

Beethoven's Sonatas

> How do the piano sonatas of Beethoven stand in order of excellence—or of difficulty? With which ones would you advise me to begin? What are some of the more pleasing ones to play in public, and which are among the less difficult?
> D. M. R.

I will list the sonatas which seem best adapted for either playing or teaching.

In an easy Grade II we may place the melodious little Sonatinas in F and G. Of about Grade III is the sonata (or rather sonatina) Op. 49, No. 2, and its somewhat harder twin, Op. 49, No. 1. Next in order comes Op. 79, with its naive, folk-song lilt. Considering the above group as introductory to the greater works, we may classify the latter under three heads: (1) those of Beethoven's earlier manner, in which he emphasizes the formal structure, on the lines of Haydn and Mozart; (2) those in which, while still observing conventional forms, he gives free rein to his personal ideas and moods; and (3) those in which he breaks loose from all tradition.

Of the first of these groups, the most pleasing are the energetic Op. 2, No. 1; the compact sonatas Op. 10, Nos. 1 and 2, and the two numbers of Op. 14, both of rare beauty and workmanship. All these sonatas are of moderate technical difficulty.

Under the second heading, the leader is easily the *Sonata Pathétique,* Op. 13, a rival in popular favor to the dramatic *Moonlight,* Op. 27, No. 2. Unique in structure is the Op. 26, with the graceful variations of the first movement, the majestic Funeral March, and the final Rondo, a masterpiece for technical drill. The *Pastorale,* Op. 28, is intricate and not so pleasing; but the three sonatas, Op. 31, are all valuable, especially No. 3, which is a marvel of concentrated thought.

We now come to that magnificent pair of sonatas which demand a pianist of expert technic and deep musical insight: the brilliant *Waldstein,* Op. 53, which bubbles over with the joy of life, and the strenuous *Appassionata,* Op. 57, which sounds the depths of human experience. Passing over *Les Adieux,* Op. 81a, as of secondary importance, we come to the capricious Op. 90, with its "conflict between the head and the heart."

The average pianist will fight shy of the five sonatas of the last period, difficult for both player and audience. Most pleasing of these is the Op. 109, in E major, with its graceful arabesques; and most difficult of all is the mammoth Op. 106 (for the *Hammerclavier.*)

A generally ascending scale of difficulty is followed in the above list. As to their order of excellence, who shall venture to say? Play the sonatas over from the complete edition—which every pianist should possess—and judge for yourself!

A Music Teacher's Education

A correspondent who signs herself *Ann,* writes that she has a large class of pupils whom she is teaching along conventional lines. But she feels the need, on both their account and her own, of a broader outlook on music than that of mere technic, and asks:

> What do you consider should be the education of a teacher before students are entrusted to her care?

Let me say immediately that I like the spirit of the writer in propounding this question, for it shows that she has ideals which are not contented with simply producing pleasant sounds out of the piano; that, in short, she places *musicianship* before technical display. I wish every teacher might have similar ideals; for we should then have more appreciation of music as an art, and not as a mere acrobatic exposition.

Proceeding now to the equipment of the piano teacher, I list the following items:

1. The ability to play well, music of at least the fifth or sixth grade.
2. Experience in playing for others; in public, if possible.
3. For this purpose, a repertory of pieces, preferably memorized, kept constantly on tap.
4. An historical perspective, gained from the study of various histories of music and biographies of composers.
5. A thorough knowledge of music notation and terminology.
6. Familiarity with at least the fundamentals of musical theory, including scale-structure, intervals and the structure of the simpler chords.
7. Acquaintance with the leading principles of pedagogy, as applied to music teaching.

These items to begin with. But do not stop here, by any means! For there is no better opportunity for advancement than that involved in the very act of teaching. New problems will constantly arise, new vistas will open for continued study; so that the teacher should constantly seek further enlightenment from books or other sources. Every teacher, in other words, should be at the same time an earnest student, otherwise she will fall behind in the race.

Practical Pointers

Miss Anna E. McIlhenny, of Chicago, sends a list of "Practical Pointers," which she gives to the mother of each child under her tuition, and which she describes as a wonderful help in her work. For the benefit of the Round Table I give these in somewhat condensed form.

1. Have a regular practice time for the child, and do not permit anything to interrupt it.
2. Remember that 15 to 20 minutes of practice twice or three times daily is better than an hour at one sitting.
3. Do not enforce extra practice as a punishment. Music should always be regarded as a pleasure.
4. Sit with the child, whenever possible, during the practice hour, even if you do not play. It will prevent careless work.
5. Do not omit a lesson for a trifling reason, since such a procedure means loss of interest.
6. Coöperate with the teacher in every way possible.
7. Never criticise the teacher or the music which she gives, in the child's presence; for advancement is in proportion to the child's faith in his teacher.
8. Ask the child to play for your friends who call, as it will increase his confidence. The piece which he plays, however, should be one that he has well mastered.
9. Allow the child to pick out pieces that are not in his lesson, provided that he does this outside of his regular practice time.
10. Always display a sympathetic interest in his work. A bit of advice, a word of encouragement, a friendly suggestion and a little praise will be helpful and stimulating.
11. Last, but not least, do not complain about your inability to get the child to practice. That reflects on the parents, and not on the teacher. If parents, who are with the child daily, lack the power to enforce obedience, how can the teacher, who sees the child but once a week, be expected to do so?

The Form of Music

> How should I teach music form? I explain to my pupils the dance forms, the sonata form, and so on, as they occur, to the best of my ability; but just *how* should this be done?—L. G. P.

Since the understanding of form in music is absolutely necessary to intelligent interpretation, I consider that the teaching of the principles of form should be a prime factor in any musical instructions, whether of voice, piano, violin or any other instrument.

Such teaching, too, should begin much farther back than with the forms you mention. From the very beginning, the child should be initiated into the nature of measures, and how these are grouped into phrases; how phrases, too, are based on figures and motives. From these he should proceed to the complete sentences and sections, and so on up to the larger forms such as the dance, rondo, variations and sonata.

All this instruction will be more effective if it proceeds naturally out of the music he is studying. Let him realize from the first the meaning of each motive and phrase—how it grows gradually up to its climax, just as does a line of poetry. How, too, phrases follow one another in symmetrical order; and how, for the sake of variety, they are often extended or curtailed. The result should be that the pupil understands just as intimately the structure of each study or piece that he learns as he does the notes of which it is composed. For unless these notes are invested with real meaning, they are a valueless hotch-potch of sound.

As preparation for this work, I suggest that you study one, at least, of the following works:

Goetschius: *Lessons in Music Form.*
MacPherson: *Form in Music.*
Hamilton: *Music Interpretation.*

Music of Popular Appeal

> Can you suggest a few pieces that would please the young people of the jazz age, and still not be of the popular type? Then there are the older people who cannot seem to understand classical music: what of them? I have found that the latter class appreciate folk-songs, or still more, the variation type of pieces.—A. McI.

It is quite possible to find music that is pleasing to both old and young, without descending to the jazz level. What the young people like about jazz is its strongly-marked rhythm—a rhythmic swing that gives it a pronounced vitality that is lamentably absent from the playing of many lackadaisical performers. The trouble with the great body of jazz music is that rhythm is everything and that the finer qualities of melody and harmony are sacrificed to it. Supply these qualities, and we have music that will appeal to all. As examples of such music, try these pieces, all of which are rhythmic and playable:

Grainger: *Country Gardens.*
MacDowell: *Hungarian.*
Rachmaninov: *Polichinelle.*
Poldini: *Marche Mignonne.*
J. A. Carpenter: *Polonaise Americaine.*

For the older people, you may add:

Coleridge-Taylor: *Deep River.*
Nevin: *Narcissus* and *Barchetta.*
Moszkowski: *Guitarre.*
Cyril Scott: *Danse nègre.*

These are modern compositions, of real musical merit. Properly performed, they should be enjoyed by everyone who has any music in his soul.

"I used to think of music as I thought of lace upon the garment—a very desirable thing if one could afford it, but I have come to believe that music is one of the essentials in our community life and that we cannot afford to neglect its development."—George Eastman.

The Musical Scrap Book

Anything and Everything, as Long as it is Instructive and Interesting

Conducted by A. S. GARBETT

THE "RADIO" VOICE

A press clipping informs us that "Radio is developing an entirely new type of vocal artists," according to Miss Eleanor Poehler, director of Station WIAG, Minneapolis and St. Paul, "who formerly was a soprano soloist well known in western musical circles."

"Thousands of voices that have not the volume required to fill even small halls have a sweetness rarely found in voices of greater carrying power," Miss Poehler declares. "Before the advent of radio broadcasting the range of such voices was limited to the confines of a small room and persons possessing them were known as 'parlor singers.' The system of sound amplification made possible through the development of radio has supplied the volume and power necessary to make these sweet voices heard in every nook and corner of the globe. 'Radio' voices they are called; and they are heard nightly in thousands of homes."

At present the singer for broadcasting purposes is unpaid, a great pity; but this cannot last. Soon new possibilities will open up for singers of the kind described above. The writer recently had a most interesting talk with Mrs. O'Brien, of "KPO" San Francisco; a new kind of impresario engaged in securing broadcasting artists. It was curious to hear her speak of "radio-artists" as though they were a class apart. So they are. Radio music has to pass twice through a diaphragm, once at the transmitting end and again at the receiving end. Just as some voices "record" better for the phonograph, so some "radio" better than others. All very interesting, and fraught with possibilities. Incidentally, a broadcasting station impresario apparently needs an infinity of tact in weeding out the fit and unfit from the multitudes of singers eager to make their debut on this new concert stage whose limit is the world's end.

THE WRITING OF SONGS

"Fortunes in Song-writing," run the guileful advertisements, wherefore we reprint the salutary advice of Charles Villiers Stanford in his book, *Musical Composition* (a book which all should read, composers or not):

"The first attempt of a tyro usually takes the form of writing a song. This is probably because the lilt of a poem suggests a musical phrase, stirs the lyrical feeling, and perhaps appeals to the dramatic sense which composers must possess in order to be composers at all. But the tyro does not know, what in course of time he will infallibly find out, that to write a good song is one of the most difficult tasks a composer can set himself. Song writing is miniature painting. The detail must be perfect from the first note to the last, capable of being examined under a microscope, and standing the test without showing a flaw. It demands a power, which is perhaps the hardest of all to acquire, of suggesting large and comprehensive ideas in a confined and economical space, and expressing small and dainty ideas without overloading them on the one hand or underestimating them on the other......

"First attempts, then, ought to be in the direction of melodic writing for an instrument, and preferably for the violin, which can play them in the pure scale. Write a melody in intelligible sentences, which is logical and clear in tonality, and to that melody *write a good bass.* Do not trouble about the intervening parts; they will come of themselves, and to any one who knows his technic, with the minimum of trouble......when a song was brought to Brahms for criticism, he invariably covered up the right-hand part of the pianoforte accompaniment before he looked at it, and primarily judged it by its melody and bass. The rest, he said, were 'trimmings.'"

THE ILLUSION OF PIANO TONE

In his book, "The Artist at the Piano," George Woodhouse reminds us once again that the tones of the piano begin to die away the moment after the hammers strike the strings. "Pianoforte tones," he says, "are characteristically evanescent. From the moment they appear they begin to disappear, regardless of the player's wishes and intentions. Yet the pianoforte, despite its shortcomings, has received more favor at the hands of great composers than either voice or violin.

"We certainly cannot attribute this preference solely to the greater harmonic possibilities it affords. *Its limitations are compensated by the great factor, illusion.*

"The pianoforte *crescendo* and *diminuendo* in the hands of an artist are as convincing to the listener as those produced by other instruments. Yet this *crescendo* is a sequence of *diminuendos*, and a *diminuendo* a broken succession of ever-decreasing *crescendos.* The illusion would be more vividly brought home to us were it possible to arrest the movement of music and register the actual sound effects so that the eye could perceive them.

"All lovers of the pianoforte and its music ought to be truly thankful for the illusion which shields their musical sense from the actual facts. It is no exaggeration to say that more of the great composers would have regarded the pianoforte as a medium for their expression were it not that the rhythmic sense so subordinated the other faculties as to cause the limitations of the pianoforte to pass unnoticed. There is sufficient evidence in the markings of their compositions to prove that composers are conscious only of the illusory effects and not of actualities.

"Beethoven evinced supreme disregard for the instrument's restricted capacity; he actually wrote *crescendo* signs to semibreve (whole note) pulses! But any one who cares to search will find that pianoforte music presents many such apparent anomalies."

HOW SCHUBERT LOST A JOB

How the impoverished Franz Schubert lost a position as Vice-capellmeister of the Imperial Court in Vienna worth 1200 florins (about $600, and of high purchasing power compared to the dollar) because of his high artistic principles, is recorded by E. Duncan in his life of Schubert.

"The candidate," he says, "was to set some operatic scenes, for which the words were provided by Duport the manager. This was of course quickly accomplished and placed in rehearsal. Then the hitch occurred. Mdlle. Schechner, the great prima donna, called upon Schubert to alter the principal air, by shortening it and simplifying the accompaniment. Schubert refused, and at the first rehearsal Mdlle. Schechner broke down. She sank exhaused on a chair by the side of the proscenium. Schindler continues as follows: 'There was a dead silence throughout the house, and consternation in every face. Then Duport was seen going from one to another of the principals and discussing matters with the singer and the chief musicians present. Schubert sat through this painful scene like a marble figure, with his eyes fixed on the score before him. Then after a long interval Duport advanced to the orchestra and politely addressed the composer in these words: "Herr Schubert, we will postpone the rehearsal for a few days, and I must beg of you to make the necessary changes in the aria at least, in order to make it easier for Mdlle. Schechner." Several of the musicians in the orchestra joined in begging him to yield. But Schubert had listened with increasing anger to the speech, and shouting out, at the top of his voice, "I will alter nothing," he shut the score with a loud bang, placed it under his arm, and marched home. Thus there was an end to all hope of the appointment.'"

THE YOUTH OF FRANZ LISZT

A virtuoso is not necessarily an apostle of virtue; and certainly Liszt was not; yet one wonders what the outcome would have been had his father not died while Franz, who idolized him, was still a sixteen-year-old boy. His mother also, he adored, but she was indulgent. "After his father's death (in 1827) he was left perfect freedom in arranging his mode of life," says Raphael Ledos de Beaufort in his book, *The Abbe Liszt.* "His mother refrained from interfering in all that did not relate to household affairs; and yet, with his artistic nature, he had no idea of a suitable division of one's time for attending to one's various duties or occupations. His father's experience and guidance were sadly missed now. The division of the day was now merely accidental, depending solely upon his humor at the time. One day he would practice on the piano; the next he would neglect to do so; sometimes he would study in the morning; at other times he would do so in the evening; just as he felt inclined. His time was not better divided for his lesson, which would often be short to-day and long to-morrow, just to suit his convenience or whim. He was also most unpunctual, arriving sometimes too early and other times too late; sometimes, also, he would not put in an appearance. His want of method and order was noticeable in the way he took his meals. He would often come home late at night without having tasted solid food all day, and, whilst waiting for his food to be ready, he would take a glass of spirits or a glass of wine, by way of staying the faintness arising from his long and voluntary fast.... He himself often deplored in after life the fact of his having been left so early in life sole master of arranging his time as he thought fit, and sole judge of what course he was to follow."

ZIMBALIST'S "TITIAN" STRAD

"In the beginning of the eighteen hundreds," says Samuel Chotzinoff in *Vanity Fair,* "a shipment of Stradivarius violins to a dealer in London was returned because of the prohibitive sum stipulated as the selling price. This was four pounds a violin! A hundred years later, Mr. Zimbalist, sojourning in Paris, pays after proper haggling, the sum of $33,000 for a Stradivarius violin which had never, since it left the Master's workshop in Cremona, been heard in a public performance anywhere on the globe.

"This is the 'Titian Strad' which made its maiden appearance in concert at Mr. Zimbalist's recent recital in Carnegie Hall.

"The years 1710 to 1720 were, according to connoisseurs, the finest period of Stradivari's long and productive career; and the violins made in those ten years show a culmination of both the artistic and scientific genius necessary for the production of so beautiful and delicate an instrument. Mr. Zimbalist's 'Titian' was made in the year 1715, at the very peak of that amazing interval. It is not on record whether the violin was commissioned by the Count d'Evry, its first owner; but it is reasonable to assume that Stradivari, at the height of his fame, would hardly have found leisure for any work but commissions. However, the record has it that the 'Titian' was in possession of the d'Evry family until the end of the eighteenth century.

"It is not known how long the 'Titian' remained with the Count d'Evry, nor how it came into the possession of the Count d'Sauzay, who was its next owner. In 1872, it was sold through the violin dealer, S. P. Bernardel, to a Monsieur Baker, who received a certified history of the violin and an explanation of the name 'Titian'; (this instrument, baptized the Titian because of its suberb red varnish, is classed with perhaps the 4 or 5 finest existing Stradivari violins).

"Mr. Zimbalist paid an astonishing price for his latest acquisition, but the beauty of the violin and its splendid state of preservation are even more astonishing. The most careful inspection has failed to discover the slightest crack or imperfection in the wood. The scroll is gracefully imaginative, yet noble and solid; the 'f' holes provocatively irregular; the belly chastely rounded. When it appeared on the stage at Carnegie Hall after a quiet and tenderly guarded existence of two hundred years, it was, outwardly, in the condition in which it left the hands of Antonio Stradivari."

THREE STEPS UP

A somewhat unusual book is *Musicians of Sorrow and Romance,* by Frederic Lawrence, in which the author expresses himself in terms of romantic philosophy, with singular charm and insight. With regard to Robert Schumann, he points out that "There were three occasions in the youth of Schumann when influence external to his own genius had a direct action upon his career, and each had its place in the development of his personality. The first was when he passed into the office of the lawyer and found music. The second when, through injury to his hand, the career of the virtuoso became closed to him, composition alone remaining. The third culminated in his marriage, when his spirit, having been given the direction, was granted flight. Clara had broken the seals which only a woman's hand may find, and a soul had swept upward which she alone, of all those who had known him, had seen hidden, and the greater life of Robert Schumann had begun."

"The secret of success in life is for the man to be ready for his opportunity when it comes."—Disraeli.

So finely made— the Low Cost comes as a Surprise

PEOPLE WHO HAVE WANTED A BABY GRAND, but hesitated on account of the cost, have learned with delight that so fine an instrument as the Brambach could be had at so modest a price. And they have been no less surprised to know that the Brambach Baby Grand requires no more space than an upright.

You should know more about the Brambach's tonal and physical beauty, developed during 101 years of good piano making—more about the ease with which it will fit into your home.

Simply mail the coupon for de luxe brochure and a paper pattern showing the Brambach's exact size, and the name of the nearest music merchant who sells the Brambach.

BRAMBACH

BABY GRAND

$635 *and up f.o.b., N.Y.*

BRAMBACH PIANO CO.
Mark P. Campbell, Pres.
640 W. 49th St., N. Y. City
Please send me paper pattern showing size of the Brambach Baby Grand.

The Singer's Etude

Edited by Vocal Experts

It is the Ambition of THE ETUDE to Make This Voice Department "A Vocalist's Magazine Complete in Itself"

Factors That Make Up the True Art of Singing

By Hermann Klein

THE following article is taken from a book recently issued by the Oxford University Press, made up in part of lectures delivered at Oxford University by Mr. Hermann Klein, a well-known voice teacher of London and a former pupil of Manuel Garcia.

The title of the book is "Bel Canto."

"It is not easy, of course, to grasp and coordinate the various factors that make up the true art of singing from the printed page alone, nor can they effectively be put into practice save under skillful and experienced guidance. Art is a thing of imitation, and in the study of singing you require the aid of the living model and critic as absolutely as in the study of painting or dancing. Nevertheless, a clear record or statement of facts is essential, and the printed page may therefore be regarded as a valuable accessory to the work of the teacher.

"Garcia recognized this when he published in this country an English translation of his famous *Traité complete de l'Art du Chant* (Complete Treatise of the Art of Song) which first appeared in Paris in 1840; and again when he supplemented it fifty-four years later with his *Hints on Singing*, which embodied all the subsequent experience garnered during a life time of successful teaching.

"The main essentials of the Italian system are the mastery of—

(*a*) BREATHING
(*b*) RESONANCE
(*c*) VOWEL-FORMATION AND ATTACK
(*d*) THE SOSTENUTO (SUSTAINED TONE)
(*e*) THE LEGATO (SLOW SCALE, REGISTERS)
(*f*) THE PORTAMENTO
(*g*) THE 'MESSA DI VOCE'
(*h*) AGILITY (COLORATURA, ORNAMENTS, ETC.)

"This order of progression is natural but by no means invariable. For example, the formation of a vowel shape must necessarily precede the attack of a sound, but the study of its manifold variations would have to come later. So the slow *scale* will naturally proceed simultaneously with the *legato;* whilst the quick scales form part of the acquisition of *agility*.

(*a*) Breathing

"Although scientific *Breathing* stands both at the base and the apex of the whole vocal structure, it is, nevertheless, the thing most neglected and most misunderstood in the average modern practice of this art. Correct instruction in respiration is, I think, the feature which chiefly differentiates the good teacher from the bad, the efficient master from the charlatan who misleads, cheats, and defrauds the innocent and unwary pupil. We cannot too frequently repeat the familiar saying of Maria Celloni:

'Chi sa respirare sa cantare.'[1]

"But commonly the novice is told, if told anything at all about respiration, to take a 'deep breath'; to fill the lungs with air as though crowding the chest with ozone or inhaling the perfume of flowers; to breathe in or out 'from the waist' (wherever that may be), or even to expand the abdomen with a vigorous outward push of that obscure muscle, the diaphragm.

"Obedience to these familiar rules must inevitably tend to guide the student in the wrong direction and lead to bad habits which, once acquired, are exceedingly hard to eradicate. The breathing taught by the old Italian masters entirely reverses the order and changes even the physical character of the usual processes of inhalation and exhalation which form part of our daily life. Singers proceed differently; hold their bodies differently; train their muscles and organs to act differently. And yet from first to last the whole procedure is normal, beneficial to the health, unfailing in its accomplishment of the right result.

"One seldom hears talk of abdominal breathing. It is this filling of the lowest part of the lungs by the expansion of the stomach which not only flattens (and therewith locates) the hidden diaphragm, but prepares for its contraction when the stomach is drawn in and the ribs are raised, thus giving the necessary impetus for the expulsion of the breath by muscular pressure from below the middle of the body, not from the region of the chest.

"This mode of inhalation is doubly beneficial: (1) because we are only able completely to inflate the lower part of the lungs by slowly introducing the air there first and filling the upper part during the same inhalation afterwards; (2) because, where we feel the breath go, thence shall we expel it; and, inasmuch as steadiness and purity of tone are only to be obtained by this *upward* pressure from between the lower ribs, just above the stomach, we thereby learn how to avoid all superfluous or ill-directed pressure, we learn how to control our breathing action from the region of the diaphragm; and how, finally, to keep the chest high and firm, utilizing it as a receptacle for air not inhaled directly into it from without, but pressed into it from the lung spaces underneath.

"Thus concentrated, the breath virtually becomes 'compressed air', that is, air possessing an inherent force of its own. Hence its greater power, moving always by muscular contraction in the upward (the necessary) direction, and so doing its work of creating tone in all degrees of loudness with the minimum of physical action or effort, and with a total absence of strain.

"This I believe to be the old Italian system of breathing, as it was taught by Manuel Garcia, and as I have taught it myself for many years. The secret of its success lies primarily in the controlling power of the abdominal support and action. Much depends, however, upon a correct attitude of the body, the capacity for retention and expulsion of the breath in any required volume or degree, and the ability to perform the mechanical functions of the breathing apparatus either slowly or quickly, as may be needed, with the same subconscious, automatic accuracy, smoothness, and noiselessness of operation.

(*b*) Resonance

"The old Italian teachers had no trouble in obtaining a bright, ringing tone. 'Resonance,' therefore, may not have entered very largely into their theory, but was far from being ignored in their practice. Thanks chiefly to their 'open' vowels an easy 'forward' tone came naturally to the majority of their students, especially the native ones. If it did not, the masters opened their pupils' throats (temporarily at least) until the sound-waves had learned to find their way to every facial cavity or space (besides the mouth) that was capable of 'reflecting' a vocal tone. The idea seems simple enough.

"The voice, in order to acquire its full vibrant power, must have the aid of a 'reflector,' just as surely as the light burning in a lighthouse. The singer can no more dispense with its aid than the performer on the piano or the violin could dispense with that of a sounding board.

"As the act of singing is a natural organic function, common to the majority of civilized people, there is no need to discuss here the physiology of tone production. The point is, rather, whereabouts is that tone situated or sounding when it has left the larynx. The answer is that a clear note is, at the moment of its utterance, instantly ringing clear and true in its ultimate position, projected and maintained there by steady diaphragmatic breath-pressure, and enhanced in strength and color by shape and other influences. To the singer the resulting sensation is that the tone is coming not from the throat at all, but existing ready-made in the area to which it is reflected.

"Free, unobstructed access to these 'forward' cavities can alone enable the voice to obtain all the advantages of complete resonance. Properly directed and well supported by the breath, it can entirely escape the danger of a nasal quality and attain increased beauty of timbre, diversity of color, and penetrative power.

(*c*) Vowel-Formation and Attack

"The formation of some vowel shape must necessarily precede the attack of a vocal sound—an act which involves the opening of the mouth. If we sing with the mouth shut we hum; but the act of humming is not without its use as a means for indicating where the vibration of the sound-waves may be *felt* re-echoing in the facial resonators when unable to make their exit by the ordinary route.

"When we open the mouth to sing a note, it must be done by dropping the lower jaw, and without moving the head, which remains erect and still. The tongue flattens as the jaw descends, whilst the pharyngeal space at the back of the throat enlarges as the soft palate rises and forms the roof of the mouth into a dome or arch. The shape thus created gives us, without further preliminary action, the natural mold for the formation of the universal vowel sound 'ah' that is, the first vowel of the Italian alphabet.

"The formation of other vowels, no matter what the language, is simply a variation on this fundamental process, although the sense of their location seems to the singer to be different with different vowels. In reality vowel sounds should all *feel* alike, to the extent that they feel so when we speak them. Only, some vowels create a more naturally 'forward' position than others, and those that do not must, by correct treatment, be made to acquire an equal degree of resonance.

"The outcome of this assimilation is that the singer finds both tone and vowel impinging upon the same identical facial area, that is to say, in the 'mask;' and there alone, will their union be made perfect. In no other fashion and by no other mechanical means can 'speech and song' be resolved into a single function.

"Garcia says (*Hints on Singing*, p. 12) that 'the Pharynx ought to be considered the real mouth of a singer.' The idea is not an easy one to convey in words, but I understand it to mean that, just as the mouth contains the organs of speech (with especial reference to consonants), so the right place for forming vowel shapes and originating tonal character is the passage leading from the throat to the nasal cavities. I also believe the idea in question to have been an essential feature of the old Italian method.

"Another idea was the utterance of 'open' sonorous vowels in a natural manner ensured a free, elastic movement of the jaw, without the least muscular stiffness, leaving the tongue 'limp and motionless,' yet not entailing an excessively wide opening of the mouth, which 'favors neither low nor high notes.' This, the true singing position, is a matter of the utmost importance, and it is peculiarly associated with the teaching of Manuel Garcia.

"The assuming of the singing position as a mental and physical attitude corresponds to the spontaneous gesture of the speaker. It coincides with the inhalation of the breath, and is immediately followed by the act of phonation or *attack* of the sound. The old Italians were right in their location of the true source of attack when they said *respirare, e poi appoggiare;* inhale, and then support with the breath. An inflated air-cushion, once the screw is tightened, affords a firm and resilient support for the whole weight of the body. Similarly, the voice must rest easily and comfortably upon the solid column of air that holds it in position.

"And it must do this from the outset. From the moment that the singing position is assumed and the vowel shape formed, the diaphragm takes control; the breath is impelled upwards into the chest, towards the throat, where it becomes tone, and towards the resonators, where it becomes a voice. The whole process is comprised in a single physical movement, in a smooth, even exhalation. Therewith, not in the throat nor with any perceptible action of the glottis, but in the ultimate 'forward' area to which it has been projected, does the attack of the vocal tone actually begin.

"I need scarcely add that the misuse of Garcia's scientific definition, *coup de la glotte*, is no longer tolerated by the best teachers.

"In vocal attack the intensity of the glottic action may vary according to circumstances. It depends largely upon the nature of the utterance or the emotion to be expressed. A perceptible glottic impetus is not in certain cases inadvisable. For the singer there must be but one aim—that the tone, whatever its character, is to be so *prepared*, mentally and physically, that it shall sound perfect from the start.

(*d*) The Sostenuto (Sustained Tone)

"In the old Italian school of singing nothing used to be more admired and cultivated than an absolutely steady tone. To-day even in Italy a strong *vibrato* or a quivering *tremolo* is generally preferred. Consequently the modern Milanese "maestro" encourages it.

"Whether a trembling tone can ever furnish a satisfactory medium for the singing of Mozart is another question. We have evidence, both internal and external, that the voices for which Mozart wrote did not suffer from this particular drawback. The sin did not become common until some years after it had started at the Paris Opera in the midway of the last century. Meyerbeer, Auber, and Gounod openly expressed their detestation of it. In alliance either with a strain of pure melody or a declamatory passage, a trembling voice, no matter how pleasing its quality *per se*, has always sounded disagreeable to the ears of an English audience.

"Intelligent use of the method of breathing described above practically obviates all danger of an unsteady tone. Instinct for the exactly right amount of breath-pressure should be natural to the good singer and made reliable by practice and experience. It contributes, moreover, to the liquid purity and clearness of timbre resulting from an undisturbed adjustment of the vocal cords.

---

[1] He who knows how to breathe knows how to sing.

"This economy of breath and this adjustment are interdependent, since the muscles of the throat respond and resist automatically in exact proportion to the varying degrees of pressure from the lungs. Yet the need for care does not end there. The singer intent upon the tone must not think of the throat, but of where and how the tone itself is being reflected or placed; that is the true *point d'appui*.

"It follows that a perfect *sostenuto* can only be obtained when the singer has the sensation of direct and uninterrupted breath support extending from the region of the diaphragm to the area of resonance.

"The gradations of strength and varieties of tone-color, like the cultivation of the *mezza voce*, are things that cannot be wholly explained or taught in books. They are best acquired by careful listening and clever imitation.

"The value of a beautiful *mezza voce* ('half voce' never seems to convey the same idea) cannot be over-estimated. Every singer ought to possess it; but, like the old *falsetto*, now happily discarded by most singers, it comes more easily to some voices than others. Learning the *mezza voce* is not unlike acquiring the knack of a stroke at golf or lawn tennis; and the ear must be kept upon the tone as the eye upon the ball.

"The art of skillfully graduating a *crescendo* or *diminucndo* (dealt with later under the head of 'Messa di Voce') should be associated with a constant endeavor to purify the tone. It is the pure sound that travels farthest, not the merely loud one. The delicate *mezza voce* of a soprano or a tenor can provide an instantaneous contrast not less delightful than that of the most exquisite variation in nuances of color. These are things that must be studied and worked at, for years if necessary, until they are definitely gained.

(*e*) The Legato (Slow Scale, Registers)

"It is one thing to sing a single note well. To sing a group of notes all equally well, with a clean, direct transition from the middle of one to the middle of the next involves a good deal more than appears upon the surface.

"It means, to begin with, command of the pure *Legato*, a term more readily understood on an instrument than in the human voice. The singing of the scale in the legato manner has often been compared to the stringing of a row of pearls. When they are perfectly matched they form the perfect necklace. The act of uniting notes identical in quality and color with unbroken smoothness constitutes the perfect legato.
